with painted glass, but this was destroyed or stolen. The over-grass-grown churchyard has no pathway, and the grass in the well-detailed old timber porch bears no imprint of worshippers' feet, while the deal form on which an harmonium is balanced against the altar-rails runs right across the chancel, and suggests the idea that the altar, with its moth-eaten cover, can very seldom be used. The archdeacon attended to meet the excursionists, and though he admitted the scandal, seemed hardly equal to the task of bringing about a better state of things. A little soap-and-water and a comparatively small sum judiciously expended in repairs would restore this interesting little building. As it is, such a church is a disgrace to the Church of England. The living is a rectory, and is held with that of Crowle, which church was restored not long ago by Mr. Preedy, after it had been allowed to remain in such a state as to nearly fall down. Mere Hall, of which we gave a little view last week, was now reached, and a most hearty welcome was awarded to the excursionists by the hospitable proprietor. The house is in Hanbury parish, and is reached through a notably fine avenue of ancient elm-trees. The entrance front faces the park, and is separated from it by a fine pair of elaborately-wrought iron gates, brought here from Hanbury Hall. Two well-designed and quaintly-roofed summer-houses of Queen Anne character occupy the corner of the quadrangle, one on either side of the large gateway. The building is very much done up, being very black and white, and a good portion of the rear buildings, built by Mr. M. Habershon in 1828, are in brick, painted over in white and black, to imitate timber-framing, and the carpenter's Gothic sashes hardly do justice to the taste of the author of the best-known book on "Timber Houses." The row of five gables, with range of small windows, form a notable feature in the front elevation, and these seem original. The date below of 1336 is evidently a redistributed use of the same figures. Leaving Mere Hall by one o'clock, a sharp drive of an hour's length brought the excursionists to Droitwich, an uninteresting and smoky town, celebrated for its saltworks.

St. Peter's Church, outside the town, was the object of the visit, but beyond the quaint Elizabethan monument in the south transept, there is little of interest. The chancel arch, however, has mouldings in it similar to those in the crypt of Worcester Cathedral, upon which we remarked last week. The church was re-peared in 1825, and restored by Mr. P. C. Hardwick in 1853. A short stay only was made here, as two hours were next to be occupied in seeing and sketching the celebrated mansion of the Pakingtons at Westwood Park. We gave three views of the house and its gateway in our last number. The main or central block of the house was erected by the "Lusty John Pakington" of Queen Elizabeth's Court, and was used as a shooting-lodge and banqueting-house, the residence of the family being at Hampton Lovet, built in Henry VIII.'s time. Originally, a small Benedictine Priory stood here in connection with the Abbey of Ponteverault, dedicated to the Blessed Virgin, but Henry VIII. gave the place to the first Sir John Pakington, who died worth no less than thirty-one manors. The four towers or wings at the angles, which form now so conspicuous a portion of the mansion, were added at the Restoration.

The position of the angle pavilions with reference to the older square plan presents some difficulty of communication between the rooms, the large central hall, which is 60ft. long, being also at a lower level than the apartments in the towers. The English Renaissance Portico is perhaps the best detailed part of the fabric, which, in other respects, is rather coarse in scale. The original roofs to the towers, with their series of small dormers, have given way to those of lower pitch which we now see, and these latter lose much of their character by the use of large blue slates, which quite destroy the scale. The two detached garden towers which remain of the four built opposite the angle pavilions, have the original quay-shaped small slates, much to their advantage. The gate-house, of which Nash, in his "Mansions of the Olden Times," gives a view, is of the same period as the main building; but modern stables have taken the place of the old ones. The house contains much rich tapestry and elaborate decoration, with many fine old pieces of furniture and historical paintings. The chapel is cold and bare, neglected

and never used. Of the mansion and its surroundings, to quote Nash, "the richness of the wood, combining with the stateliness of the edifice, forms a picture of ancient magnificence unequalled by anything in this country." The church and Court-house at Salwarpe concluded the buildings visited on Thursday—

"High on a grassy hill the old church stands,
Apart from human dwellings, grandly lone;
Eternal vigil o'er the valley lands,
Keeps the grey tower of lichen-covered stone."

The chancel was rebuilt by Mr. Pickering, of Durham, in 1848, and the roofs were renewed in 1857. Mr. Preedy has also done some work here, including the erection of the south porch; and Mr. Hopkins improved the chancel in 1864. The manor or court-house is a large half-timbered building, now used as a farmhouse. The entrance-door and bargeboards figure in Habershon's "Half-Timbered Houses," where a view of the charming bay at the end of the house is hardly done justice to. The house is situate on the banks of the Salwarpe, and it was here that Richard Beauchamp, Earl of Warwick, was born, 1361.

On Friday morning the excursion party were graciously entertained to breakfast at Madresfield Court by Earl and Countess Beauchamp. The greater portion of the house is nearly new, and is the work of Mr. Hardwick, though some parts of fairly-designed Tudor remain. The mansion is surrounded by a moat, and is approached by a drawbridge, and is considered by Parker, in his "Domestic Architecture," to have originally inclosed the outer bailey of a castle of much greater extent. The church hard by, within the park, is a well-designed building, with tower and spire, by Mr. Preedy. The beautiful entrance-lodge is one of Mr. Norman Shaw's characteristic works, and so is the charming pigeon-cote or tower adjoining the farm-buildings. The new stone church of St. Lawrence, already referred to, built from the designs of Mr. Hardwick, was next visited at Newlands, and its elaborate and well-executed decoration, executed by Messrs. Clayton and Bell, formed a striking contrast to the church at Huddington Court seen yesterday. Great Malvern and Little Malvern churches were next seen, and here two hours were well spent at the former celebrated building (of which we shall give some particulars when we record the visit of the Archaeological Association held there this week) when Mr. Hopkins read a paper on the fabric. The day concluded by a visit to Ledbury, where the old timber market-house, which stands detached at the end of the street, forms so important a feature. We gave some carefully-measured drawings of this building a short time ago by Mr. E. J. May. The old Grammar School and St. Catherine's Hospital were also seen, as well, of course, as the spacious and important church of St. Michael. The tower and spire, like the one at Bosbury, are quite detached from the church, the spire being of good proportion and erected during the middle of the last century. The chancel is Norman, of 1080 date, arcaded only half of its length, the wide gable-roofed aisles, of late 14th-century work, being continued as chapels on either side, with a large hagioscope on the north side, the angle of which seems to indicate that the high altar originally stood several feet from the east wall. The chancel arcade is curious, inasmuch as the square bases or plinths are much higher than the cylindrical columns which they support. The circular clerestory windows occur over the piers. The fine south arcade to the nave is of good Early 15th-Century style, and that on the north is a poor copy of it, erected in the early part of the 17th century. The Decorated north transept, or baptistery, was very badly restored by Sir Gilbert Scott in 1852, when the present dreadful glazing was inserted. There is a good marble tomb in the chancel, with a handsome canopy, and series of figures dated 1631. The west front is of Early English date, with Transitional doorway and side turrets, giving a cathedral character to the building. Mr. Richard Coad is about to restore the north aisle, and it is to be hoped that the hideous gallery there, and the opera-box pew of the Biddulphs, will then be removed. The final dinner of the excursion was held on Friday evening at the "Star" Hotel, Worcester, the headquarters of the party, when the usual toasts were recorded.

On Saturday, the proceedings concluded by

visits to the churches of St. Andrew (illustrated by us a year or so since, and cleverly restored by Mr. Aston Webb), St. Alban's, in Fish-street, and the new Church of Holy Trinity, at Shrub Hill, built from the designs of Mr. Hopkins. We publish a drawing to-day, giving a section of the Guesten Hall roof, as rebuilt over this church.

The Guildhall, of which we also give a drawing, was likewise seen. It was built from the designs of Thomas White, a native of Worcester, who served his apprenticeship to a stone-cutter in Piccadilly, and afterwards became a pupil of Sir Christopher Wren. He also assisted in the preparation of the plans and drawings for St. Paul's Cathedral. The Guildhall was erected in 1721 at a cost of £3,727, the wings being built some few years later. The building, after a series of competition squabbles and reports submitted by Mr. Waterhouse and Sir Gilbert Scott, Mr. Hopkins and Mr. Day, Mr. Rowe, the City surveyor, and Mr. Bidlake, was restored by Mr. Henry Rowe in conjunction with Sir Gilbert Scott, R.A., the wings being entirely rebuilt. These latter are not quite like those shown in our drawing, which gives them as at first designed by Sir Gilbert Scott. In execution a less number of windows have been used. Mr. Dixon was the contractor, and the cost of the restoration was about £22,000. Mr. W. H. Letheren, of Cheltenham, restored the beautiful iron entrance-gates.

THE STONE FOR TRURO CATHEDRAL.

A MEETING of the Truro Cathedral committee was held last week at Bishop Phillpott's Library, Truro, for the purpose of receiving a report as to the stone to be used in the building of the Cathedral, to sanction progress, to instruct the architect and invest in him such powers as might be necessary and proper. The report of Col. Cocks and Mr. Warrington Smyth, who have been engaged for several weeks past, with the assistance of Mr. Bubb, the clerk of works, in making investigation as to the relative merits of various stone quarries in the county, including Polyphant, in the parish of Lawanick; Tartendown, in the parish of Landrake; the two quarries of Wild Duck, in Wendron; Garlain, also in the parish of Wendron; Pentewan; Lantewy, in the parish of St. Neot, and also at some granite-works in Penryn, was presented. The object of this investigation was to assist Mr. Pearson in the selection of stone best suited for the building of the Cathedral. A conversation took place as to the desirability of publishing this report at present; but under all the circumstances it was thought better to withhold its publication for a few weeks until the committee held another meeting, at which both the Earl of Mount Edgcumbe and the Bishop of the Diocese may be present, and the matter more fully discussed. The committee recommended certain varieties of Cornish granite and elvans for use in the exterior and interior walling, as well as the introduction of other Cornish stone in some interior details; but any final decision is deferred until the next meeting which will probably be held in about six weeks. In the mean time the architect has been authorised to proceed with the building of the crypt up to the floor of the choir with the material now in use, the exterior wall being of granite. Rapid progress is now being made with this work, the walls and most of the piers being already up to the springing for the vaulting of the crypt; but there is sufficient work in hand to keep the architect and men fully engaged until the committee again meet, and definitely determine the question of the stone to be used in the building of the Cathedral.

A merchants' house is being erected at Royal Exchange-place, Dundee, from the designs of Mr. J. Murray Robertson, architect, of that town. The contracts, which amount to about £1,800, have been let as follows:—Masonry, Mr. Alexander Duncan; joinery, Messrs. W. and R. Brownlee; plumbing, Mr. David Brown; slating, Mr. Storrer; plastering, Mr. Ovenstone; glazing, Messrs. Lindsay and Scott; and iron columns and girders, Mr. David Keay, Hillbank Foundry.

Mr. Brannon, C.E., of Westminster, is making preliminary surveys for a projected line of railway to connect the watering-places of Walton-on-the-Naze and Harwich.

NATIONAL HOSPITAL FOR THE DEFORMED.—OLD WROUGHT-IRON GATES, &c., GUILDHALL, WORCESTER.—THE OLD GUESTEN HALL ROOF, WORCESTER MONASTERY.—HUDINGTON COURT HOUSE.—THE GUILDHALL, WORCESTER.—CHATEAU IN THE ALBAN SLA.

OUR LITHOGRAPHIC ILLUSTRATIONS.

NATIONAL HOSPITAL FOR THE DEFORMED, GREAT PORTLAND-STREET.

OUR illustration, taken from the drawing in the last Academy Exhibition, shows the building for the deformed about to be erected in Great Portland-street, and extending in rear to Bolsover-street, designed by Mr. George Vigers, 4, Fredricks-place, Old Jewry. The brickwork of the two fronts will be gauged-work: the walls of the internal areas will be faced with glazed white bricks. The roofs of the two street blocks will be covered with Broseley tiles, the connecting wing being kept at a lower level and covered with lead, and will have a surrounding rail supported on strong balusters. The plans show the accommodation provided. The wards and other rooms are to be heated with Galton's ventilating stoves. Cold fresh air is to be taken to the rooms by flues under the windows and other convenient places, and discharge from upright pillars with regulating covers. Flues, alongside the smoke flues, are provided for the extraction of vitiated air. The builders are Messrs. Colls, Moorgate-street.

WORCESTER GUILDHALL FENCING.

THE whole of the ornamental portion has been repolished, the old being past repair. The old work has been correctly copied, and the character kept up. It is no doubt the finest specimen of Old English ironwork in existence. The repolished work is worked in a peculiar manner from sheet-iron one-sixteenth thick, and the edges being turned down to make it look considerably thicker. The shields have the city arms worked in relief. These are new. The old ones were in cast iron. The scrollwork on top of piers is new, and replaces the old sheet-iron ones, and are so arranged to carry lamps, which was not in the original. The whole of the work has been carried out under the direction of Mr. Rowe, architect, Worcester.

HUDINGTON COURT HOUSE.—THE OLD GUESTEN HALL ROOF, WORCESTER.—THE GUILDHALL, WORCESTER.

THESE sketches are described in our concluding report of the excursion of the Architectural Association on p. 2.

CHATEAU IN THE ALBAN SLA.

FROM the site of this building, magnificent views are obtained over the island-dotted sea and the

mainland of Asia Minor; but, "though every prospect pleases," it is a land of earthquakes, and unfortunately, the works at the chateau have been suspended, owing to the dreadful calamity which has recently fallen upon the district. The building is intended for the residence of an English lady of exalted rank. It is to be built of local white stone, the hall, staircase, &c., being lined and paved with marbles. The hall is a large apartment about 25ft. high, with panelled ceiling, having galleries on two sides, giving access to the rooms surrounding it on first floor, and to the turret staircase leading to roofs, &c. With the exception of sanitary apparatus, painted windows, &c. (which will be supplied by English firms), the whole of the work will be executed by native labour. The architect is Mr. Edwin T. Hall, A.R.I.B.A., of 57, Moorgate-street, London.

NEWCASTLE-ON-TYNE.

A GREAT scheme of town improvement is now being carried on at the east end of the town by the Corporation of Newcastle. The aim of its promoters has been to bring the rising traffic of the east end into more direct communication with the centre of the town, and to open out for the inhabitants of the increasing villages lying at the riverside between Newcastle and North Shields more convenient thoroughfares in their entrance to and egress from Newcastle than they have hitherto possessed. The formation of three new streets or roads to branch off from a thoroughfare commencing at Pilgrim-street, comprises the main portion of the Corporation project, and about three months ago the task of property-demolition was commenced. The route of the new roads will extend from Pilgrim-street, at a spot a little to the south of the Royal Arcade, over the Manor Chare, past the front of the Jesus Hospital, and to a distance beyond the Skew Arch underneath the railway company's lines. Here a junction of roads will be formed, the principal one of which will run in a south-east direction to the south side of Sallyport Gate, at the foot of the Causey Bank, where it will join the present New Road and the head of the Milk Market. The second road will run in an easterly direction to Melbourne-street, and will form a straight thoroughfare from the Skew Arch to the spot near which the newly-erected Church of St. Cuthbert now stands; while the third road—which may be properly classed as a branch one, will extend in a north-east curve from the junction to the arch nearly immediately underneath the Manors Station, and leading into Trafalgar-street. The work extends over 63 acres of ground, and considerable progress has now been made by the contractor. A viaduct of thirteen arches will be made from Pilgrim-street to the Manor Chare. This will be built of brick and stone, and already a portion has been constructed. The road will be carried over the Manor Chare by means of an iron arch about 18ft. high, 50ft. wide, and with a span of 45ft. The contractor for the scheme is Mr. C. W. King, of Gateshead, who has at present about 300 hands hard at work at various parts of the route, and the engineer is Mr. Alfred M. Fowler, borough engineer. The total cost of the undertaking—including the purchase of old property, the erection of the viaduct, buttresses, and the carrying out of the entire scheme, is estimated at £112,000. The whole of the roads are to be 50ft. wide throughout, and are to be fully completed according to contract in November next year. The work is one of the greatest engineering undertakings ever commenced in Newcastle, and the growing demand made for mere quay room and the contemplated establishment of a foreign-cattle sanitarium at the Ouseburn by the Council should, it is thought, cause the new thoroughfares in the future to rank amongst the busiest and most thriving in Newcastle. Building-sites for shops and other business premises will be provided all the way from Pilgrim-street on the south side to the Milk Market, on a level with the new road to that place, and on each side of the other road, from the Skew Arch to Melbourne-street, similar provision will be made. Both of these circumstances, it is anticipated, will in time improve the rateable value of the town to a considerable extent, and ultimately amply repay the present investment.

THE NEW NORTH DOCKS AT LIVERPOOL.

THE new docks, which the Prince of Wales is to open on the 8th prox., are situate to the north of Liverpool, in the borough of Bootle, and at the estuary of the Mersey, immediately facing the Rock Fort and the village of New Brighton. The works were commenced in October, 1873. The scheme consisted of an enlargement and alteration to the form of the present Canada basin, with a double entrance 65ft. on its north side, leading into a half-tide dock of 18 acres. This dock is formed somewhat in the shape of the letter L, and from its eastern extremities, or the top of the letter, there runs a branch dock of three acres, and two graving docks of 950ft. each in length. These are subdivided by intermediate gates into lengths of 500ft. and 450ft. respectively, and are provided with powerful pumping machinery of the Turbine type. This half-tide dock also communicates, by means of a passage 50ft. in width, with the Brocklebank dock. In its north-west angle a double passage, 60ft. in width, leads to the steam-dock, which is specially adapted for the requirements of the largest class of steamers which frequent the port. The form of this dock is somewhat peculiar, the design being particularly adapted to the trade in question, which requires a minimum of water-space, combined with a maximum of quay. The main body of the dock, 1,600ft. in length, and 50ft. in width, runs parallel to the river, and at right angles to this portion run three branches in an inland or easterly direction, averaging about 1,370ft. in length, by 300ft. in width. The total area of this dock, with its branches, is 43 acres, and the lineal quays are 11,000ft. All the quays will be flanked by sheds 95ft. in width, and on the west quay of the half-tide dock called the Langton dock, there is a shed 1,500ft. in length, and 80ft. in width, as well as one of 900ft. in length, and 96ft. span, on the north quay of the Langton branch. On the north side of, and leading out of, the steam dock, by a passage 50ft. wide, is another dock of 18 acres, capable of affording accommodation which it may be found desirable to locate here. The most interesting features in the design and construction of these works are, doubtless, connected with the construction of the main entrances. In order to maintain the approaches and sills of these entrances free from the silty matter with which the troubled waters of the Mersey are heavily laden, a gigantic system of sluicing has been carried out, which presents many entirely novel features, and is probably quite unique in the history of hydraulic engineering. As an instance of its magnitude, the dimensions of the feeding culverts may be mentioned. The largest of these are 15-ft. by 13-ft., and 12-in. by 12-in., while at the depth of 15ft. below the level of low water of spring tides, as many as four lines of pipes, 8ft. in diameter, have been laid, which will enable the sluicing power to be brought to bear on all portions of the basin, no matter how far from the side walls. Over four and a half million cubic yards of material have been excavated, and 450,000 tons of gravel or shingle; 75,000 tons of Portland cement were employed in the concrete work, and six and a half million bricks were used in the erection of sheds and other buildings. The available depth of water at the main entrance is 33ft. The aggregate area of water-space is 82 acres, and the total lineal quays 20,000ft. The Parliamentary estimate for the scheme was £2,691,000.

The Duke of Devonshire will visit Carlisle on the 6th prox. to lay the foundation-stone of the new grammar-school about to be erected at a cost of £10,500.

The modern parish church of Clacton-on-Sea was consecrated on Wednesday week after enlargement by the addition of two transepts, chancel, vestry, and organ-chamber. About 200 additional sittings have been provided. The east window is filled with stained-glass, by Messrs. Clayton and Bell, of Regent-street, London; the subject is the Lord's Supper. Ventilation is provided on a new principle suggested by Dr. Wallace, of Colchester. The alterations have been carried out under the direction of Mr. John B.ys, by whom the chancel and chancel-arch are to be decorated in colour when funds permit.

The Derbyshire Archaeological Society, numbering about 80 members, visited on Saturday week Chesterfield, Bolsover Castle, and Hardwicke Hall.

Third Floor

Measuring
over 5

A detailed architectural floor plan of the second floor. The plan shows a central corridor with several rooms branching off. On the left side, there are rooms labeled '10', '11', '12', and '13'. On the right side, there are rooms labeled '14', '15', '16', and '17'. The central corridor is labeled '18'. The plan also shows various doors, windows, and structural elements like walls and columns.

SPECIFICATIONS.*

LAST week we noticed a work illustrating a large scale details of house-building by Messrs. Palliser, Palliser, and Co., of Bridgeport, Conn., U.S.A., and we now draw attention to a work on "Specifications" prepared by the same firm. This work consists of printed forms, and includes articles of agreement between contractor and proprietor, with blank forms for filling up a bond; forms of specifications of materials and labour for masons' and bricklayers' work, carpenters, painters, slaters, plumbers, tinners, gasfitters, and engineers' work. Looking over the form of agreement, we find the usual conditions of contract introduced, and these are pretty full and clearly stated, though not in the usual terms found at home. As regards payments to the contractor, these are enumerated, and there is a provision appended to the effect that the certificates do not exempt the contractor from the liability to replace work if it be afterwards discovered to have been done ill, or not in accordance with drawings and specifications. The clause referring to the joint effect of the specification and drawings runs thus:—"That the specifications and drawings are intended to co-operate, so that any works exhibited in the drawings and not mentioned in the specifications, or *vice versa*, are to be executed the same as if mentioned in the specifications, and set forth in the drawings to the true intent and meaning of the said drawings and specifications." The third article relates to additions and alterations. It gives the proprietor the power to make any change without injuriously affecting or making void the contract; the difference for omitted work is to be deducted from the amount of contract by a "fair and reasonable valuation"; and for additional work required the amount is to be agreed upon before commencing additions, and such agreement is to state extension of time (if any) to be granted by reason thereof. The 6th article says: "No new work of any description done on the premises, or any work of any kind whatsoever, shall be considered as extra unless a separate estimate in writing for same before its commencement shall have been submitted by the contractor to the superintendent and the proprietor, and their signatures obtained thereto." Day-work accounts to be delivered to the proprietor during the week following that in which the work may have been done. These clauses are sufficiently binding, and are improvements upon many of similar import we have seen. Each trade has its own specification, a plan which has many advantages over the ordinary English mode of including the various trades in the same general specification. In each case a list of drawings is prefixed with general conditions. All drawings, writing, interlineations, figures, and details are taken as part of and as illustrating the specification; and it is stated "where figures are not given, the drawings must be accurately followed, according to their scale." Further directions state that, on the plans, blue designates stone, red brick, and yellow wood, and that the drawings and specifications are the property of the architect, and must be returned to him at completion of the work. The general conditions prefixed to each trade, requires the contractor to furnish all labour, materials, and apparatus required, to provide the best description of materials, and to remove all rejected; not to underlet the work without consent; and to be responsible for all violations of law, official notices, damages to property, &c. The items of masons' work include excavations, stone and brick footings, whitewashing, ironwork and brickwork, drains, &c. We find mention is made of hollow walls, and these are described to be tied together by iron-cramps set in every 6th course, and about 2ft. 6in. apart. The Carpenters' specification is very full and complete. Framing is particularly described, and the roofing and scantling are given with much detail. We meet with a few terms like "sheathing," "clapboarding," "lumber," which are not familiar to readers of English specifications. The fittings are pretty complete in their enumeration, though a great deal is left to the drawings. Elevators, electric bells in connection therewith, hand-lift or dumb-waiter, refrigerators, clothes-shoot, burglar alarms, telephones, and every modern appliance are included. We fail to see any provision made for disconnecting the drains, though ventilating-

pipes to the soil and waste-pipes, with ventilating caps, are specified, and also 1½ in. pipes from the top of all traps in the building to upright pipes. Steam heating is also described. Each specification is intended to be signed by the owner and contractor, and witnessed. As an *aide memoire* for architects and surveyors in writing specifications, or in preparing quantities, these outline forms will be found useful, and the young architect will derive instruction from their perusal. The price of the whole book is only 2s.; the sheets are printed only on one side, and the whole bound at the narrow edge in paper covers, with tape for rolling up.

MAHOGANY.

THERE is perhaps no wood with which we are acquainted of which so many varieties are known, as that we term mahogany or baywood. The mahogany first introduced and used mainly for cabinet work was the dark, dense timber termed "Spanish mahogany," imported chiefly from San Domingo. From this source for many years all the best logs were obtained, and the fine old furniture of the Georgian period was almost all of it made of the San Domingo wood. As soon as this supply fell short, other islands in the Antilles and the mainland of the isthmus were explored, and quantities of excellent wood were obtained from them. The wood from the central region of Mexico and from the Island of Cuba was but little inferior to the best qualities from St. Domingo, and from the regions further south, in Honduras, British and Dutch Guiana, logs of more fully-grown timber and of vast size were obtained. The lighter, open-grained wood, termed "baywood" or "Honduras," which in its best form may even approach the quality of the Spanish mahogany, but which chiefly approximates more nearly the texture of cedar, is now much used for joiners' work. The finest old Spanish wood is so scarce and valuable, that the bulk of it is probably cut up for veneers. The Cuba wood, which takes the place of that formerly brought from San Domingo, is mostly small. It comes over in sticks rather than in logs, seldom exceeding 2ft. square, and is liable to be "stainy" or streaked with purple. Some of the Central American timber from the interior of Mexico is very dense and rich in colour, and, perhaps, rivals that from Cuba. All mahogany darkens in colour on exposure to the atmosphere; but it is a favourite trick to stain the lighter varieties with an alkaline wash, in order to give them a darker tone. Few woods stand wear and tear better in cabinet-work than fine mahogany, and the bright, rich tints are found in no other wood with which we are familiar. It seems probable that all the mahogany timber to which we have alluded is the produce of the same tree, the *Swietenia mahoganii* of botanists, so called after Van Swieten, a Dutch physician; but evidence on this point is rather confusing. The value of mahogany fluctuates greatly, and the purchase of this timber is said to be always somewhat of a lottery. Buyers test the quality by boring into the log with an auger; but this plan is liable to mislead. There is a sort of tradition, the truth of which it is difficult to test, that Messrs. Broadwood once gave £3,000 for three logs of mahogany, all of them cut from one tree. Each balk was 15ft. in length, and 3ft. 2in. square. This would give 451 cubic feet, and a price of £6 13s. per cubic foot! In some other accounts of this transaction, the price named is £2,000, which, if correct, would represent £5 9s. per cubic foot. The cause of this extraordinary price is said to have been the extreme beauty of the "curl" or figure of the wood, which rendered it suitable for the production of veneers. Strange to say, this high-priced mahogany was imported from Honduras, and it seems probable that while the northern district of the country bordering on Mexico produces dense and fine qualities of timber, the wood grown in the low, swampy districts to the southward has given a bad name to the mahogany of the whole district. In an interesting paper read at the Society of Arts by Mr. Leonard Wray in 1859, on "Timber for Ship-building," printed in Vol. VII. of the Society's "Transactions," an account is given of the cutting down and preparation of this wood for sale, and, as touching the density of the best Northern Honduras mahogany, we read that its specific gravity equals that of the finest Travancore teak, and

is superior to English oak. The difficulties in felling the wood in the trackless forests and bringing it to Belize for sale appear to be immense, and all the labour has to be done at night by torchlight, owing to the intense heat.

Mr. Wray, in the paper before alluded to, states that mahogany is only classed in the second rate at Lloyds' among the timbers for shipbuilding purposes. While eight varieties of wood are ranked in the first division, we find mahogany included among the 20 species of timber placed in the second class, the reason being that fine, dense mahogany is too costly and good for the purpose, while the cheaper baywood, the price of which would enable it to be used, comes only in the second division. The mahogany of Hispaniola is said to have been used by Raleigh for the repair of one of his ships in 1595, and a Spanish line-of-battle-ship, built at Havannah, of the finest picked timber, when captured by the English and broken up, more than 100 years after she had been launched, was found to have every timber sound. The Queen's own steam yacht, the *Victoria and Albert*, is built of mahogany.

Concerning the first use of the wood in this country, it is stated that Dr. Gibbons, of King-street, Covent Garden, having received a few planks from his brother, a sea-captain, in 1724, had some of the wood, which had been previously rejected by a huller as worthless, and incapable of being worked, made into a candle-box by a cabinet-maker named Wellaston, who recognised the fine qualities of the material, for which a demand speedily sprang up, and from which he is said to have realised a fortune. The mahogany of East India and the west coast of Africa, though the produce of trees of the same natural order, the *Cedrelaceae*, does not appear to be obtained from the *Swietenia*, and the wood is in many ways inferior to the West Indian timber. In the above notes, we have brought together as far as possible the existing information respecting mahogany; and in drawing attention to the subject, we trust we may elicit some additional facts from those among our readers who have had practical experience concerning this timber.

CAERLEON.

THE annual meeting of the Monmouthshire and Caerleon Antiquarian Association was held at Caerleon last week, when Mr. Octavius Morgan, the President, favoured the company with an interesting review of the history and chief objects of antiquarian interest in the locality. Having expressed his conviction, judging from its position on a flat surrounded by hills—one which the ancient Britons would never have selected—that Caerleon must have been founded by the Romans, and that it was one of their characteristic square-built towns surrounded by walls with a forum in the centre, he went on to say that no trace was left of its original formation except the roads traversing it, and but little was known of it after the departure of the Romans till after the fifth century. Various writers had indulged in fanciful ideas as to its state in the intervening period, and one historian (Giraldus) had given glowing accounts of it, which he thought were much overdrawn and untrustworthy. The fact that the settlement was overrun by the Northmen, and was twice burnt down by the Danes, was sufficient to account for the disappearance of every vestige of the original Roman structures. Caerleon was remarkable to the antiquarian for some things—namely, the Roman amphitheatre, otherwise wrongly called King Arthur's Table, and the Castle Mound. As for the amphitheatre, it was, undoubtedly, a Roman work, and was very similar to one outside the walls of Rome, called the amphitheatre of Castrucci, and the idea that it had some connection with the Knights of the Round Table must be exploded, because there was no trace of any Arthurian building or reminiscence about Caerleon. The castle mound was conical in form, and similar to mounds found all over England. Among other places there was once one at St. Woollos, Newport, but it had of late years been lost sight of beneath the rubbish from the railway. The Caerleon Castle Mound was, like it, far more likely to be the work of the Northern invaders (either Saxon or Dane), than to have been raised by the native tribes of this island. It was clearly post-Roman and Pre-Norman. As

* Specifications: being Printed Forms prepared and published by PALLISER, PALLISER, AND CO., Bridgeport, Conn., U.S.A.

for the ancient state of Caerleon, the remains of beautiful Roman pavements showed that there was a considerable degree of elaboration in the houses; the bronzes which had been discovered indicated that artistic work flourished at the period—though whether it was of British or foreign workmanship was not known; and there had also been found a remarkable specimen of plate-glass, evidently rolled out (as pastry would be rolled), and not cast in the present way, and this, he was much inclined to think, must have been manufactured in England. In conclusion, the president touched upon the remains of the priory, the origin of which had always been a mystery, though there was evidence that the Cistercian Order established itself in this neighbourhood at a very early period, and it was conjectured that the monks must have migrated to Llantarnam Abbey, still, however, keeping up this priory.

PRACTICAL NOTES ON PLUMBING.*

XI.

By P. J. DAVIES, II.M.A.S.P., &c.

BENDS (continued).

TO complete my instructions on "Bend-making," I must describe the method of making bends in the centre of a long length. Assume that you have a 10ft. length of soil-pipe and you require a bend in the middle of it, and again assume that you have not any long dummies: you should slit the two sides (as at DB, Fig. 44) at the point where you require to make the bend, say, 12in. or 18in. long, pull the lead open and then your pipe round, work the lead truly round with your tools from the inside and outside of the bend; when you have soldered up the seam your bend is complete.

ELBOWS, SOIL-PIPES, AND TRAPS.

Elbows are frequently made to save the expense of proper bends. They are exceedingly useful for rainwater-work, though often used for closet-work. When used for the latter purpose, the pipe should have as much fall as possible, though actually elbows should not be used in closet-work, unless it is from a nearly horizontal to a vertical soil-pipe, such as would occur from the outlet of a trap to the down-pipe.

Fig. 62 is a finished elbow, A being the part coming from the trap, B the soldered part of the

elbow, D the down or vertical soil-pipe outlet. In this instance you will perceive that the elbow will work equally well as the bend, because the fall is good, and the soil tumbles over the throat of the elbow direct into a vertical pipe.

There is, comparatively speaking, no skill required to shape such a piece of work: all you have to do is set your elbow out on the floor or bench as shown at Fig. 63, A B being the straight pipe B, though commonly called the rake or fall line. Here you see that this line cuts the straight line in D, and E cuts again the pipe-line at F. Draw the dotted lines D G H I square to the pipe, and cutting the points D H, then from I to F. F to G will be the size of the piece to be taken from the throat, if you desire to make a true elbow.

This exact method here explained we seldom

* All rights reserved.

or ever adopt; but instead, only cut three parts away, and the other part use for lap and for allowing the elbow to be worked round at the back as at I F G. In this case the solder need not be taken all round, but finish as shown at K. There is one thing important in elbow-making (which many think and say is unnecessary for me to mention, and so far as thoroughly intelligent workmen are concerned it is quite right, but there are other than thorough practical men whom these articles are intended to benefit), always well work the lead down the throat of the elbow at B, Fig. 64. This prevents hair, &c., &c., lodging at this point.

SOLDERING ELBOWS.

Having soiled the elbow, shave it to about 1in. wide for the outside, and 1/2in. wide for the inside. Shave it first or before pulling it up together, then pull it up as at Fig. 64 and from

the points A D. Tie the ends together with string, and solder up the throat to appear as shown in Fig. 62.

SOIL-PIPE MAKING.—COPPER BIT WORK.

This work is very easily learned. Take a piece of lead wide enough to wrap round a wooden mandril, the size of the required pipe, and say 10ft. long; place the edges true one with the other, wrap the lead round the mandril and withdraw it, then soil the pipe, and with a gauge hook shave the desired width 1/2 of an inch, after which tack the lead together every 10 or 12in., and solder it down, using rosin freely. The larger the copper bit the better chance you will have to float your work.

DRAWING SOIL-PIPE WITH POT AND IRONS.

This requires a little more care and practice than the last-described method of work. Proceed as follows:—Having prepared the pipe as for copper-bit work (except the shaving), shave it at least 1/2in. wide, or with a gauge-hook 1/2in. blade, this will make a 1/2in. seam. Now take a ladleful of hot solder, your mate holding the edges of the lead together, you pour a little solder across the seam every 8in.; this will keep the edges up in proper position. Then take a red hot iron, and with a strap of lead burn the two ends together; this is most easily done by your mate holding an old felt under the seam. This done, all is prepared. Take the ladle in your right hand and the iron in your left, pour some solder upon each side of the seam, and get up the heat; then with the red-hot iron draw it first on one side, then the other of the joint; this causes the solder to flow down the pipe; at the same time you must keep pouring fresh hot solder upon the joint. Suppose you have a start of 9in., or, in other words, 9in. soldered, then let your mate start 6in. from you, and with a sponge pour a little cold water on the seam—this prevents the pipe opening; thus you work down the pipe, your mate following with the sponge. If by chance a little solder hangs to the side of the seam, the mate should push it away with a little stick.

N.B.—The bench should have a fall 1in. in 10ft.

STACKING SOIL AND OTHER PIPES.

Soil and other pipes should be properly stacked away. One of the best methods is shown at Fig. 65; it is simply a shelf having F nailed on the front; by stacking the pipes carefully away you often save yourself the trouble of driving.

DRIVING SOIL-PIPES.

This is done by driving a short length of mandrel through the pipes, to take out the dents or bruises. For this purpose a piece of 1/2in. gas-

pipe, or a length of ridge-roll, is frequently used.

STINK-TRAPS AND THEIR VARIETIES.

Stink traps, as you will see by the "Alphabetical List," have many titles. I do not pretend to treat half of the number of names known, but only those in general use. There are the Antle trap, Balance Trap, Ball trap, Bath or belly trap, Bowl and Pipe trap, Branch trap, Cistern trap, Circular trap,

trap, Davies's trap, Dip trap, Eclipse trap, Fat or Grease trap, Flap trap, Float trap, Flower-pot trap, Gully trap, Half trap (Hellyer's), Hunch trap, Intercepting trap, Inverted Cup trap, Knott trap, Lip trap, Mansion trap, Man-ion trap, trap, trap, trap, Siphon trap, Side trap, Signal Alarm trap, Sink trap, V trap, Ventilating trap—all of which have been made of lead. The above are only a few quoted from memory, and are only a portion of the multitude, and yet nearly all are subject to, and dependent upon, the same law of action—viz., the water-seal. We are told that Glanber, the old chemist, knew the value of the water-seal, or Stink trap, and I quite believe he made use of what we now call the Be'l trap, as a water-lute or valve for arresting his chemicals or gases, and to this day we, together with the first chemists of the land, are glad to use this simple contrivance as a governor or check against noxious gases.

The simplest made of all traps for sanitary purposes is that known as the bowl-and-pipe-trap, mostly used for rainwater-pipes, sinks, bath wastes, &c., &c., especially when these pipes empty themselves into the old-fashioned "brick-trap." I have personally, about 20 years ago, taken six, or in some instances, ten such ends of pipes, into one bowl or cistern; for instance, on the Camp-bourne Estate for the late Mr. John Jury, who was greatly in favour of them.

I always endeavour, even now, to carry the ends of waste or other pipes (excepting soil-

pipes) into the water of an outside gully-trap, as, by so doing, all draught is prevented from coming up this pipe; it also dispenses with the

necessity of another trap being fixed inside or just below sink. This trap is neither more nor less than a bowl of water, having the end of a pipe dipping into it as at A, Fig 66.

Here you see the bowl B, which may be made to any shape (round bottom is best) and of any material (in the olden days it was of lead); now it is not unfrequently a common flower-pot with some Portland cement dropped to the bottom.

I must ask my readers to take notice of this trap, as I think it was the first step towards the invention and adoption of the well-known G-trap, the history of which I am endeavouring to trace.

(To be continued.)

TESTS FOR STONES.

FOR purposes of the engineer, or in geological surveying, the physical character of a rock is of value. There are a few tests which it may be necessary to have recourse to. Mr. W. H. Penning, F.G.S., says: "To ascertain the kind of rock exposed in a pit or quarry, a fragment is detached from that part which has been least altered by the action of the weather. A good-sized piece of the rock is broken off, and afterwards reduced by chipping into a square lump. Good edges are thus obtained for observation of its texture by the aid of a pocket-lens." Scratching is a tolerably good means of testing hardness, and the young architect or geological student might examine the hardness of the stones in any locality with the aid of his pocket-knife. Those which are easily scratched, effervesce rapidly by dilute hydrochloric acid; and generally the degree of durability of a stone may be ascertained by the rapidity or slowness of effervescence. Calcite or carbonate of lime, limestones, &c., are easily scratched and effervesce rapidly under acid. Magnesian limestone and dolomite do not effervesce quickly, and many sorts of stone, like gypsum sandstone, do not effervesce at all. Other important tests may be resorted to if additional information be required, and the texture and colour are important for the architect. Texture is discovered by chipping an angle, and this may be crystalline, earthy, fibrous, granular, or compact. The behaviour of a stone before the blowpipe is another valuable test: some stones reduce to quicklime, as those in which carbonate of lime is the chief constituent; others are fusible more or less, and some yield copper, lead, glass, slag, &c. It would be as well if these simple means of testing were more generally known and exercised in the selection of building-stones.

MOTIFS FOR PANEL DECORATION.*

MR. JOHN WARD, of Birmingham, is the author of a series of suggestions for the use of art manufacturers, which is intended to be completed in four parts. Parts I. and II. are now upon our desk, and the author apologises for the appearance of his work by stating he has frequently felt the want of suggestions when there has not been the necessary time or inclination to obtain details for his purpose. No doubt Mr. Ward speaks on behalf of a large class of manufacturers in Birmingham and elsewhere who do not trouble much about art, but who find it necessary to make their goods "artistic" or decorative, though we have a strong opinion that if necessary time cannot be found for artistic details, manufacturers had better not risk their reputation upon art by copying inferior designs. We have on more than one occasion spoken of the injury done to real art by the publication of stock designs, which no artist, properly so-called, thinks of using any more than a skilled writer would condescend to use a set of ready-made sentences or "elegant extracts." We do not believe it is possible for anyone to become artistic by a system of plagiarism or cribbing. These remarks, however, only apply to those who use design in an unmeaning sort of way, and not to those who publish them, who may be prompted by the highest motives. The designs shown are of a general character, and are intended to supply motifs for the decorative artist, cabinet maker, earthenware manufacturer, metal-worker, and amateurs who devote their leisure to painting on china, &c. In the first part are

no less than five plates, and these consist of suggestions suitable for panels, stained glass, *repoussé* relief, carved work, painted pottery, &c. The stalks, rushes, and leaves in plate I. are arranged after a Japanese fashion and exhibit variety in panel treatment. The sunflower conventional decoration, Plate II., and the border enrichment, are more satisfactory specimens. The suggestions for medallion decoration are quite Japanese in conception, though they are not all very happily worked out. They illustrate emblematic devices, as Morn, Noon, Air, and Water, &c. Plate IV. shows a rather *naturelque* treatment of blackberry and thorn rose with spiders' webs, suited for long panels; and another design, foliage and trees, with a bird on the wing and a butterfly, is intended probably for a screen. The other part illustrates decorative designs of a similar class suitable for panels and medallions, the chief character of these being a natural rendering, in a Japanese spirit, and for lacquer-work, china painting, &c., the designs may be suitably employed. Mr. Ward is fond of flowers and birds disposed in the unsymmetrical fashion so characteristic of the art of Japan; in one plate, VII., there is a panel in a Jacobean or Queen Anne style; in another a series of fables intended for tile decoration; and the remaining designs show pleasing instances of panel decoration, in which birds, fish, and foliage are combined in a quaintly conventional manner. The plates are well photo-lithographed and effectively printed, and the work will prove a help to those decorative artists who may have panels and surface ornament to execute.

THE AMERICAN SOCIETY OF CIVIL ENGINEERS.

THE address of the president of this Society, Mr. James B. Francis, at the 13th annual convention, held at Montreal last June, shows that since the foundation of this Society in 1852, it has been constantly increasing in usefulness. Including honorary members, associates, and juniors, the Society now numbers 636 members, and we may congratulate them on the purchase of a permanent home in the city of New York. The president's address mainly touched upon water-power in the States, a branch of engineering of which he is an authority. Mr. Francis sketches the earliest applications of water-power—namely, to grist and sawmills, which were essential to the comfort of the early settlers. At Paterson, New Jersey, the "Society for Establishing Useful Manufactures" formed in 1791 the first machinery worked with water-power; after which the facilities furnished by the Passaic, Merrimack, and the Mohawk rivers, where falls of 35ft. and 105ft. gave additional impetus, and horse-power to a large amount was utilised. At Lowell, Massachusetts, at Cohoes, in the state of New York, at Manchester, New Hampshire, at Lawrence, Holyoke, at Lewiston, and other places, the water-power of the rivers, in some cases augmented by the erection of dams, has been turned to account. Mr. Francis alludes to the usual process of developing water-power in America. "A company is formed to acquire the title to the property, embracing the land necessary for the site of the town, and the population is sure to gather around an improved water-power." An official report states that in the State of Maine, the survey of water-power recently made is between one and two millions of horse-power. Some of these are not available, for want of railways, capital, or population, as in the case of an elevated region in the north of the South Atlantic States, close to the cotton-fields, and the area of which exceeds 100,000 square miles.

Referring to the manner in which the power of a waterfall can be utilised, compressed air is mentioned as more convenient than ordinary motors. The fall may be too small to be utilised by the latter, or the site where the power is wanted may be too distant from the fall, or it may be desired to distribute the power in small amounts at distant points. The president mentions a method of compressing air by means of a fall of water devised by Mr. Joseph P. Frizell, C.E., of St. Paul, Minnesota. The air is carried "in small bubbles in a current of water down a vertical shaft to the depth desired to give the compression, then through a horizontal passage, in which the bubbles rise into a reservoir near the

top of this passage, the water passing on and rising in another vertical or inclined passage, at the top of which it is discharged, at a lower level than it entered the first shaft." As waterfalls are usually in rocky formations, the passages and reservoir could be cut in them, and it would be necessary only to charge the descending column of water with bubbles of air, which can be done by throwing the water into violent commotion at its entrance, and a pipe and valve for the delivery of the air from the reservoir. Sir W. Thomson's idea of utilising the Falls of Niagara by transferring its power by electricity for the production of light and mechanical power over North America, is considered feasible. Water-wheel improvements, by which a larger percentage of the theoretical power of these machines can be utilised than before, is another matter touched upon, and the president concludes his address with an interesting explanation, derived from actual observation, of the way in which "anchor or ground-ice is formed" at the surface of the water and finds its way to the bottom. The ice is formed in small needles on the surface of the water, which, if not agitated, would form a sheet of ice there. The currents, disturbance, and interchange of position in a flowing stream causes the water at the bottom to rise to the surface, and *vice versa*, and the needles of ice are carried to the bottom, and adhere thereby by the process known as "regelation." It is shown that this adherence is always down stream, "and that water powers, supplied directly from ponds, or rivers, or canals frozen over for a long distance above the places from which the water is drawn, are not usually troubled with anchor ice, which requires open water, up stream, for its formation." The *Transactions* of the Society contain a full account of the minutes of the meetings, and reports of committees, which are full of interest.

SOMERSETSHIRE ARCHÆOLOGICAL SOCIETY.

THE thirty-third annual meeting of the Somersetshire Archæological and Natural History Society was commenced on Tuesday at Clevedon.

At the opening meeting, Dr. E. A. Freeman (the retiring president) said he was there merely as a bird of passage, both in Clevedon and in this island in general. He had no more to do but to give up the chair in favour of Mr. Edmund Elton, who must be well-known to every one in Clevedon, and who he was sure was a good choice to be their guide and leader.

The President (Mr. E. H. Elton) then took the chair, and delivered his inaugural address.

In the afternoon the members of the society visited Clevedon Court, at the invitation of Sir Arthur Elton, who read a paper descriptive of the building.

A vote of thanks having been passed to Sir A. Elton, the party left Clevedon Court and proceeded by rail to Yatton, where they inspected the fine old pretendal church, dedicated to Saint Mary the Virgin. The church was described by Mr. E. B. Ferrey, Dr. Hardman, and Mr. E. Green. The church is a large cruciform structure, with a central tower and unfinished spire. There was formerly a Norman fort here, but it is now buried. The present building is of four different periods—Early English, Decorated, Early Perpendicular, and Late Perpendicular of the Somersetshire type. In the north transept there are a couple of tombs, with effigies. In the centre there is a tomb, which has been identified as that of Sir Richard Newton, a former Chief Justice of the Common Pleas, who died in 1448. He was formerly Recorder of Bristol. There is a beautiful church erected by the Newton family, and dedicated to St. John the Evangelist.

Subsequently a visit was paid to the Old Rectory, at Yatton, which Dr. Hardman explained was considered to have been erected about 1440, and was one of the finest examples of a Mediæval rectory. The party returned to Clevedon by the 4.35 train, and visited Clevedon Old Church, the principal features of which were described by Mr. E. B. Ferrey. The church is cruciform, with a remarkable Early Decorated nave arcade, and Perpendicular clerestory. There are Norman arches on the north and east sides of the central tower, and a curious monu-

* Motifs for Panel and Other Decoration. By JOHN WARD, Birmingham.

mental effigy of Jacobean period. Attention was likewise called to a peculiar cruciform west window, and the rich Late Perpendicular poppy-headed bench-ends to nave.

In the evening a meeting was held at the Public Hall for the reading and discussion of papers on subjects of local interest.

Mr. C. E. Davies, F.S.A., gave a description of the recent Roman discoveries at Bath. In 1755 some excavations were made near the Abbey, and the result was the discovery of a large system of baths, and in consequence of excavations which he had recently made at the expense of the Corporation, he had been enabled to make a correct plan of them. In 1871 he found a large Roman drain, and by clearing out this they were enabled to carry the excavations to a greater depth, and the result was that they discovered recently a large bath 80ft. long and 40ft. wide within a large hall exceeding 120ft. in length. Subscriptions were started with the object of clearing the baths, which were built of the most massive masonry, and making them available for the public. The excavations had revealed the fact that these baths occupied about one-fourth of the ancient city of Bath.

On Wednesday the members assembled at the Clevedon Public Hall in the morning to take part in the excursions which had been arranged for the day. The first place visited was Tickenham Court, which was described by Mr. Emmanuel Greene. The remains are those of a manor-house of the early part of the 15th century, erected probably by one of the Berkeley family. The only part remaining is the hall, and that is in a very dilapidated condition. Tickenham church was also inspected, the chief features of the building, which was described by Mr. Ferrey, being its fine Perpendicular tower, Early English south porch and north aisle, containing three effigies of the same period; low Norman chancel arch and ancient font. A move was then made to Wraxall Tower House, a Medieval house, with a Tudor tower. The parish church of Wraxall was next visited. It has recently been restored, and Mr. Ferrey, in his description, said its Perpendicular tower was one of the finest in the county of Somerset. There were traces of a Norman church, and also of an Early English church; but the structure at present was of the Middle Perpendicular period. A drive of about half an hour brought the party to Ashton Court, the seat of Sir Greville Smyth, Bart., who had invited the Society to luncheon. Ashton Court was formerly the seat of the Daubenys and the Chokkes, and considerable interest was derived from an inspection of the extensive collection of family and historical portraits, and specimens of natural history. The Rev. Mr. Way having conducted the party over the mansion, a visit was made to Long Ashton Church. Mr. Ferrey stated that the church had nothing of Norman remains, the earliest being the effigies of the 14th century. The tower seemed to be rather earlier than the rest of the building, and was Early Perpendicular. The nave arcade was certainly very Late Perpendicular, and one might almost call it Debased. One of the most striking and remarkable features on entering was the very splendid rood-screen, which was always coloured, and which was restored about eight years ago, the old colour being faithfully reproduced from the existing original. It had not been used in these churches in Devonshire, Somerset, and Cornwall to see the screen running right across. This had remained singularly perfect, and was one of the glories of the church. From Long Ashton the members proceeded to Flux Burton Church—a small edifice of the Perpendicular period, with Norman south doorway, chancel arch, and font. Afterwards an inspection was made at Buckwell Church, the chief features of which are its fine Perpendicular tower, and the mortuary chapel of the Rodneys. The Rev. E. Burbridge, the rector, read a short paper on the history of the chapel. The next stoppage was at Chelvey Church, the body of which is in the Perpendicular style, while the chancel is Early English. Attention was called to the remains of Medieval painted glass, and the rich Early Perpendicular mural tombs in the south aisle. The building is in a dilapidated condition, and no restoration seems to have been attempted for some years past. There are only seats for about fifty persons. An inspection was also made at Chelvey Court, where there are the remains of a fine old mansion-house of the Tyntes.

Dr. Hardman pointed out the principal features of interest, attention being particularly called to the very fine staircase. Nailsea Court was to have been visited, but as the afternoon was far advanced, this was passed over, and the party proceeded to Nailsea Church, and were afterwards entertained to tea at Nailsea rectory by the Rev. J. Johnson. As the consequence of the late return of the members, the evening meeting for the reading and discussion of papers was delayed. The Rev. H. G. Tomkins gave a description of Worlebury camp, and the Rev. Fred. Searth contributed a paper on the history of Wrington. Yesterday the society visited Cadbury camp, Postbury priory, church, and camp, Portishead, Clapton-in-Gordano, and other places.

OUR COMMONPLACE COLUMN.

OBLIQUE ARCH.

AN oblique or a skew arch is an arch built in an oblique direction, or not at right angles to the abutment, as in the case of a bridge crossing over a road obliquely. The beds or courses of an oblique arch are spiral surfaces wound round a cylinder, every part of which cuts the axis at a different angle, the latter being greatest at the keystone and least at the springing. The art of oblique bridge-buildings has been traced back to the year 1530, when Nicolo Braccini, of Florence, called "Il Tribolo," erected a bridge over the river Mugnone, near Porta Sangallo, at Florence, on the road to Bologna (see "Vasari," Vol. XI., p. 308). Geo. Stephenson appears to have been the first to introduce them on railways, and Mr. G. W. Buck, the author of "Oblique Bridges," showed how the dimensions and lines were to be obtained by trigonometrical calculation. The elements of the subject are discussed in Nicholson's work on "Stone Cutting" (1828); but those who desire more detailed particulars, should consult Mr. Buck's "Essay on Oblique Bridges," a new edition of which has recently appeared (Lockwood and Co.). In this edition Mr. W. H. Barlow, C.E., has appended a method for facilitating the construction of oblique bridges by diagrams and multipliers, from which the dimensions for forming the templates and working the stones may be obtained. Only cylindrical arches are considered proper; elliptical arches are not so well suited for an oblique plan, are less stable, and more difficult to execute. Mr. Buck says that 25° is the natural limit of obliquity to which an arch can, with scientific propriety, be constructed when composed of an entire semicircle on the square span. Hitherto 45° has been considered as the greatest degree of obliquity at which it is safe to construct an arch, arising from the difficulty of making a semicircular arch safe at that angle; but the author shows that though the difficulty increases from 90° to 45°, it is less from 45° downwards, and an arch may be safely built at an angle of nearly 25° (see article in *Engineer*, *Britannica*).

OCTAGON.

To draw an octagon without a plan, the sides are thus proportioned: Make the centre equal 5 parts by scale, and the sides 3½ parts each, or 12 parts altogether. *Octagonal Plans:* The baptisteries of St. John Lateran, Rome; of Florence, Perugia, Pisa, Parma; Stoney Middleton Church, Derbyshire, is also octagonal, and St. Dunstan's, Fleet-street; and the form has been used in Mr. Newman Hall's church, Westminster Bridge-road, and other modern buildings.

OCTOPARTITE VAULTING.

The Angevine vaulting, as seen at the hospital at Angers in France, is of this kind; it has eight ribs, and Mr. Street says it has nothing analogous to it in England; it is very domical, both in its longitudinal and transverse sections. See Professor Willis's remarks in *Transactions of R.I.B.A.*

OFFICES, DOMESTIC.

The usual domestic offices attached to a good house comprise, besides the kitchen, butler's pantry, housekeeper's room, still-room, store-room, scullery, steward's room, servants' hall, housemaid's closet, larder, &c. The dairy, bakery, brewery, beer, coal, and wood-cellars, ice-cellar, laundry, and other conveniences are generally arranged round a kitchen court. In town houses the offices are generally placed in a basement, and are necessarily limited. Main offices should be attached to the house without

sacrificing the comfort of the principal rooms, and should be separated by a door from the hall. For examples of planning domestic offices we refer the reader to the illustrations in the *BUILDING NEWS*, to Kerr's "Gentleman's House," and to Wightwick's "Hints to Young Architects" (Guillaume's edition).

OGEE ARCH.

(FRENCH *inflexe*, *contre-courbe*). One of the earliest examples of an ogee arch is a tomb in the north aisle of Salisbury Cathedral, circa 1216. This form of arch took its origin, no doubt, from the Arabs, who used it in the 13th century.

PACKING-CASE.

For tables showing the solid contents of packages the reader may consult Mr. M. K. Todivale's "Calculator of Measurement of Packages, Timber, Casks, &c." (See recent notice of this book in the *BUILDING NEWS*).

PAGODA.

With respect to the derivation of this term, it is thought to be from the Persian *pout* idol, and *ghadu* temple, and to be a corruption of the term "dagoba," the relic shrine of the Buddhists. (See Ferrierson's "Indian Architecture," and "Arch. Diet.")

PAINSWICK STONE.

An oolitic limestone quarried near Gloucester. This stone is of a light cream colour, and is very uniform in grain. It was used in the interior of the Houses of Parliament. Its chemical analysis shows it to be largely composed of carbonate of lime. It weighs in an ordinary state 125lb. per foot cube, and works like Bath stone, being harder than Corsham, but is not a weather stone. For steps and landings it has been largely used at Roupell Park, Brixton. According to the "Arch. Diet." the best stone of this sort is only obtained from the Ball's Green Quarry, near Stroud. The cost delivered in London, according to Laxton, is 2s. 2d. per foot rough block.

COMPETITIONS.

BRENTFORD DRAINAGE.—In this competition sixteen sets of plans were sent in, and were referred by the Local Board to Captain Galton. The first premium has been awarded to the plans sent in by Messrs. Gotto and Beesley, of Great George-street, Westminster. The works are estimated to cost about £18,000.

CHIPS.

We hear that the "Imperial" self-acting exhaust ventilators (Weaver's patent), which have been recently taken up by the Sanitary Engineering and Ventilation Company, of Victoria-street, Westminster, are now being applied to the Shore-ditch Town-hall, for the ventilation of the council-chamber. The company's "Imperial" ventilating-tubes are also being fitted there, as well as at the Army and Navy and New University clubs.

Foundation-stones of a new Primitive Methodist chapel were laid at South Normanton, near Derby, on Monday week. The architect is Mr. John Wills, of Derby, and the contractors are Messrs. W. Wass, of Normanton, and J. Redwood, of Sutton-in-Ashfield.

The Chesterfield board of guardians adopted last week, plans by Mr. Rollinson, their architect, for the remodelling of the workhouse, rendered necessary by the removal of the children to the new industrial school buildings.

Extensive alterations have just been commenced in the Derby Assize Courts, with the hope of improving the accommodation. The seating in the new portion of the courts will be remodelled, giving more room to the Bench, jury, and bar, and removing parts of the galleries, while hot-water pipes and extracting-ventilators will be put in. The contract for structural alterations has been taken by Messrs. Walker and Slater, of Derby; that for joinery and wainscoting by Messrs. Fish and Sons, Nottingham, and that for warming, heating, and ventilating by Messrs. Benham and Sons, London. The estimated cost is £1,500.

The parish church of Rowley Regis was reopened on Sunday week after partial restoration.

The foundation-stone of the Town-hall for Penny Stratford was laid on Monday week, with public rejoicings.

Building Intelligence.

BOLTON.—The new infirmary at Bolton is to be opened on the 5th of next month. The plans of the structure, which were selected out of sets sent in by 37 competitors, were prepared by Mr. R. K. Freeman, architect, of Derby and Bolton. The style is Gothic. The building is constructed of brick, with Yorkshire stone dressings, and may be said to consist of four distinct departments. There is, first of all, the administrative block in the centre, the right and left pavilions, and a children's hospital at the rear of the left pavilion. All these are connected by corridors only one story in height, so as not to interfere with the free circulation of air. Over the entrance-hall there is a tower which rises to a height of 103ft. from the ground. The dimensions of the wards are as follow:—Large pavilions 59ft. by 27ft.—cubic space per bed, 1,820ft.; small wards 22ft. by 16ft. 6in.—cubic space per bed, 1,877ft.; children's wards 35ft. by 26ft., with a cubic space for each bed of 1,700ft. There will be room for 75 beds in all, 42 being in the men's wards, 17 in the occasional wards, and 16 in the children's hospital. The principal corridor extends from end to end of the building, with a total length of about 300ft. Special care has been taken in the construction to reduce the danger arising from fire to a minimum. The wards will be heated by a system of central fireplaces, which combine open grates with hot air and ventilation.

KIRESTALL.—The partial decorations of the parish-church have just been completed. They are wholly mural and mainly of the chancel walls, of which the decoration on a diaper ground, interspersed with a few bands of relieving colour in due architectural harmony, is chaste, yet presenting graceful outlines. Above a dossal hanging are entablatures of figures, painted on a dead gold ground, but mainly in outline, slightly tinted. On the wall north and south of the east window are John the Baptist and St. Stephen, the dedicate Saint of the church; and on the north and south chancel walls the figures of the four Evangelists. Each of the figures is surmounted by a canopy. The design and execution of the above is by Powell Bros., Leeds.

LEVENS, WESTMORELAND.—A new schoolhouse, comprising a schoolroom and a classroom, has just been built and finished in this township at Beathwaite Green, by the Hon. General Upton, of Levens Hall, and this week it was formally opened by the General and Mrs. Upton. The building is from the design of Mr. Eli Cox, architect, of Kendal, and was carried out under the personal supervision of that gentleman; the masonry by Mr. Thomas Pricket, of Beathwaite Green; the woodwork by Mr. Thomas Sisson, the Levens joiner and house-carpenter; and plastering and colouring by J. Steel and Co. of Kendal.

MICHELDEVER CHURCH, HANTS.—This church was reopened on Sunday, the 14th inst., after having been closed for alterations for some time. The church before the restoration consisted of a western tower (16th century), a vestibule connecting same with nave, and containing a gallery and organ; a nave in the form of an octagon with two quasi-transepts, built of red brick and covered with slate and having heavy plaster mouldings and arches on the inside; a chancel covered with cement on the outside, and encumbered with heavy plaster mouldings and arches on the inside; there was also a red brick and slated vestry and furnace chamber opening out of the vestibule. The seating was of oak, narrow and uncomfortable, and placed on a stone floor. The alterations and improvements effected consist of the restoration of the chancel, by the removal of the cumbrous plaster arches, the insertion of a new panelled and moulded wooden ceiling, with carved bosses, the mouldings and bosses being richly coloured and gilt, the erection of an organ-chamber and new chancel-arch, with carved capitals and marble columns, a new glass mosaic pavement, new oak altar-table, choir-stalls and prayer-desk, a marble credence table, and a brass altar-railing and standards. In the nave the oak seating has been reconstructed and placed on a wooden floor, the gallery removed, and the tower-arch thrown open to the church. A fine old stone arch of Early

Perpendicular work has been brought to light and restored. A carved stone pulpit, executed by Mr. Newman, of Winchester, has been erected, stone traceried windows, filled with cathedral tinted glass in geometrical patterns, have been inserted in the place of the old wooden ones. The western doorway and window have been restored, the latter filled with stained glass. A handsome polished brass eagle-lectern, by Jones and Willis, has been presented by residents in the parish. In the chancel are handsome marble monuments to various members of the Baring family, by Flaxman, to which has been added a beautiful marble structure, by J. E. Boehm, A.R.A., to the memory of the late Mr. Thomas Baring, of Norman Court, represents two kneeling angels watching a panelled portal. The cost of the restoration (exclusive of the lectern, stained glass in western window, and marble monument in chancel), is about £2,600, the whole of which has been borne by the Earl of Northbrook. The work has been ably carried out by Mr. W. Coles, of Winchester, builder, under the superintendence of John Colson, F.R.I.B.A., and Son, architects, of the same city.

PANTASAPH.—The new chapel of St. Clare's Orphanage and Convent at Pantasaph, near Holywell, was opened on Wednesday. The chapel has been designed by Mr. Edmund Kirby, of Liverpool, who was also the architect of the convent buildings. It is situated on the north side of the convent, and will accommodate about 300 persons. Its width is 28ft. 6in., and it has a centre aisle with benches arranged on each side, while the total length inside is 108ft. There is an apse at the sanctuary end of the church with an ambulatory round the altar, and a clerestory. This clerestory is supported by seven arches, resting on polished Anglesea marble columns. The style adopted is Early English of a severe type, to meet the simple characteristics of the order. The external walls are of the local limestone, with Talacre stone dressings. The general contractor for the work was Mr. William Owen, Liverpool, and the whole of the work has been carried out under the superintendence of Mr. Kirby. The other contractors were—For the stained glass, Messrs. John Hardman and Co., Birmingham; for the reredos and altar, Mr. R. Boulton, Cheltenham; for the tiling, Mr. Leadley Brown, Liverpool (agent for Craven, Dunnill, and Co.)

WALTON-LE-DALE.—The corner-stone and memorial stones of a Wesleyan chapel at Walton-le-Dale, have been laid. The style is Gothic; the building is being built of brick with stone dressings, having ornamental brick panels in the gable and other parts of the structure. The woodwork will be of best pitch-pine, stained and varnished. The roof will be open-timbered, having carved and moulded principals, and the windows glazed with cathedral tinted glass. The chapel will be approached by a fair-sized porch at the south side from the main road. The dimensions of the chapel will be 52ft. 3in. by 29ft. There will be a transept on the east side, a chancel measuring 19ft. by 9ft., and a vestry in the rear. The yard and out-buildings on the west and north will be inclosed by a brick wall. The whole contract, including pulpit, heating-apparatus, gas-fittings, railings, gates, &c., has been let to Mr. H. Ward, of Preston, for £1,277 19s. 4d. The architects are Messrs. Myres, Vaver, and Myres, of Preston and Westminster.

A Hull journal states that, a few days ago, a joiner and builder named Brumpton disappeared from Grimsby, and shortly afterwards it was found that he had got a considerable number of acceptances cashed prior to his departure. The inquiry showed that Brumpton had for many months past been raising money on forged bills, which he redeemed as they fell due, and at length he absconded. It having been ascertained that he had left Liverpool for Philadelphia, a cablegram has been forwarded to the authorities, asking for his detention at that port.

An inquiry was held at Chesterfield on Thursday, the 18th inst., before Mr. Robert Morgan, C.E., an inspector of the Local Government Board, into an application from the rural sanitary authority of Chesterfield Union for sanction to borrow £370 for sewage disposal in Hasland parish. Some opposition was offered to the scheme on behalf of owners, who thought the sewerage should be extended further.

"To a practical man with a taste for mechanics, and the bump of constructiveness fairly well developed, we can conceive no higher mental treat than a couple of hours spent over the June numbers of that truly marvellous publication the *English Mechanic*. In a hundred and fifty odd pages that make up the bulky mass of letterpress, there is recondite information on almost every conceivable subject, ranging from how to construct a mouse-trap, to the latest method of calculating the phases of Orion."—*The Brightonian*. Price Two-pence of all newsmen, or post free 2½d.—31, Tavistock-street, Covent garden, W.C.

TO CORRESPONDENTS.

(We do not hold ourselves responsible for the opinions of our correspondents. The Editor respectfully requests that all communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondence.)

All letters should be addressed to the EDITOR, 31 TAVISTOCK-STREET, COVENT-GARDEN, W.C.

Cheques and Post-office Orders to be made payable to J. PASSMORE EDWARDS.

ADVERTISEMENT CHARGES.

The charge for advertisements is 6d. per line of eight words (the first line counting as two). No advertisement inserted for less than half-a-crown. Special terms for series of more than six insertions can be ascertained on application to the Publisher.

Front Page Advertisements 2s. per line, and Paragraph Advertisements 1s. per line. No front page or paragraph Advertisement inserted for less than 5s.

SITUATIONS.

The charge for advertisements for "Situations Wanted" is ONE SHILLING for TWENTY WORDS, and Sixpence for every eight words after. All Situation advertisements must be prepaid.

Advertisements for the current week must reach the office not later than 5 p.m. on Thursday. Front page advertisements and alterations in serial advertisements must reach the office by Tuesday to secure insertion.

TERMS OF SUBSCRIPTIONS.

(Payable in Advance.)

Including two half-yearly double numbers, One Pound per annum (post free) to any part of the United Kingdom; for the United States, £1 6s. 6d. (or 6dols. 40c. gold); for France or Belgium, £1 6s. 6d. (or 33f. 30c.). To India (via Brindisi), £1 10s. 10d. To any of the Australian Colonies or New Zealand, to the Cape, the West Indies, Canada, Nova Scotia, or Natal, £1 6s. 6d.

Mr. CHARLES WILSON, of 13 and 15, Lighthouse-street, New York City, is authorised to receive American subscriptions at the rate of 6 dols. 40c. per annum.

Mr. R. M. TUTTLE, of Titusville, Penn., U.S.A., is also authorised to receive subscriptions at the same rate.

Cases for binding the half-yearly volumes, 2s. each.

NOTICE.

Vol. XL, Price 12s. A few bound volumes of Vol. XXXIX. may still be had, price Twelve Shillings; all the other volumes are out of print. Most of the back numbers of former volumes are, however, to be had. Subscribers requiring any back numbers to complete Vol. just ended should order at once, as many of them soon run out of print.

RECEIVED.—J. W. and Co.—H. and Co.—J. and H. R.—G. C.—J. D.—M. and Co.—W. H. S. and Son.—J. N. J. and Co.—G. W. G.—T. and R. B.—G. E. H.—M. Bros. and Co.

ASSISTANT.—(Lewis and Son, 1, Lowndes terrace, Knightsbridge.)—BOAR. (We believe they can be obtained at Batsford's, 52, High Holborn.)—JEFF OLDHAM. (You had better write to the secretary, at 9, Conduit street, W.)—W. LAURIE. (The first description of Mr. Engert's device for the prevention of echoes in buildings appeared in the BUILDING NEWS of Aug. 13, 1880, on p. 176.)

"BUILDING NEWS" DESIGNING CLUB.

RECEIVED.—F. M. S.—Yarra Yarra. (The designs will be returned shortly.)—A. L. B.—Veronese.

Correspondence.

SANITARY PLUMBING.

To the Editor of the BUILDING NEWS.

SIR,—Mr. Davies thinks that, by his experiments at the discussion on Monday last, he has conclusively proved his assertion that the O-trap will clear itself as well as the siphon. I certainly differ from him. If he intended to show how a O-trap would act when placed under a w.c., he has certainly failed altogether. The two arrangements will admit of no comparison. The model produced held less than half a pint of water, and yet through this little thing Mr. Davis thought it necessary to pass about 1½ gallons of water, or nearly 30 times the quantity contained in the trap.

Now, Pullen's cast O-trap holds 3½ pints of water. To test this, so as to fairly compare with the model, you must place it beneath a tank holding 12 gallons of water, and this quantity must pass through by means of a 4in. plug into the trap in the same time as did the 1½ gallons through the model.

Had Mr. Davies taken the plug out of his tank and thrown in 2 pints only of water, the test would have been a fair comparison to an ordinary w.c. flush; but I think anyone will see

that, as it was, it was most misleading. Of course, the same will apply to Mr. Hellyer's experiments as far as they represented w.c. traps.

Mr. Davies seems to think it a point in favour of his trap, that with the ink test, the black water passed away before the flush had time to mix with it.

I really can see nothing wonderful in this. The fact is, between the plug of the tank and the seal of the trap there was a space filled with air, and when Mr. D. raised the plug, the great weight of water falling through forced this air, which in its turn forced the seal before it, so that by the time the flush had reached the trap nearly all the ink was out at the mouth.

With reference to the quantity of water held in the body of various traps, I have also tested this, and find as follows:—

The old \odot ,	1 in. seal, holds 5 pints.
Pullen's cast \odot ,	1 in. " " 3 1/2 "
Hellyer's V	1 1/2 in. " " 5 1/2 "
Smeaton's Eclipse	1 in. " " 3 1/2 "
Round \odot -Siphon	2 in. " " 4 1/2 "

—I am, &c., DANIEL EMPTAGE, S.E.
Dane Hill Sanitary Works, Margate,
August 20.

SIR,—Mr. Davies has not yet fully established his theory, or proved any superiority over the \odot -trap gained by the almost new construction of the \odot -trap, which is certainly well known and acknowledged to be a great improvement on the old and cast \odot -trap. As I remarked in my last letter, "contracting the width of the body is a step forward in the right direction," and tends to prove that if there are others unwilling to learn anything from these lectures, it is not so with Mr. D., and I hope soon to see the \odot -trap constructed, not only according to his model, but with a few additional improvements—namely, by rounding the bottom, thus doing away with the sharp angles, and allowing the top to form a part of the outgo, and by allowing the outgo to be the full width and part of the trap, for by doing so it will prevent the breaks formed at the sides and top by the solder in the interior of the trap, and recommending a vent-pipe to be always attached to prevent siphonage and perforation of the lead by the action of the gases; and, lastly, the most important of sanitary rules is efficient water-flushing, for the soil passing into the trap should never be allowed to rest, but made to move speedily in one continuous swift stream direct into the sewer, and a good flush can always be obtained by slightly increasing the size of the valve and flushing-pipe, thus allowing the water to be suddenly discharged and making the removal complete; for a large amount of water sent through a small pipe is scarcely of any value, and the chief fault of a foul-smelling trap and closet is generally insufficient water-flushing; for a pail-full of water occasionally thrown down into a closet is of much more value than the same amount delivered slowly into the basin, thus causing the soil to be only partly removed at each flush, and adhere to the inside of the trap and soil-pipe, to putrefy and generate gases, only waiting for a chance to pass into the house through some defective fitting, especially if not properly ventilated.

Now, I believe there are some people who will fix almost anything bearing the name of a trap, especially if cheap, quite regardless of the important part it has to play in connection with sanitary matters, and, if we could have the \odot -trap in a much improved form it would be something gained, and of some advantage to the public, and would help to remove many objections to the present form of the \odot -trap.

Still I contend that you can only prove which trap has the advantage over the other by actual test, side by side, and each fixed under the same relative conditions, which was not the case in Mr. D.'s case; therefore it was simply no test, and I am confident that a trap constructed on siphon principles would have acted equally as well as the model in question (if not far better); in fact, Mr. D. himself publicly owned "that the siphon-trap would clear itself far better than a \odot -trap, of such things as gravel, sand, &c."—I am, &c., H. B.

Lambeth, August 22nd.

VENTILATION OF SOIL-PIPES.

SIR,—Mr. Buchan has no ground for imputing to me "tradesman conceit" or "mercenary considerations," but he is not so invulnerable,

having, as he says, fitted "hundreds of my disconnecting ventilating traps." He is naturally, and, perhaps, excusably angry, if anyone should hint the possibility of his patent being a "superfluity." Nevertheless, he has not even attempted, either scientifically or practically, to prove it otherwise. I have hitherto refrained scrupulously from attacking his or anyone's patent; but in the interest of the poor owners of property, have recommended a simple, inexpensive, and, as I believe, thoroughly effective expedient. This correspondence has, so far, failed to elicit any clear rebutting evidence.

The irrelevant comparisons, dogmatic assertions, and opprobrious epithets, which are the principal weapons wielded by Mr. Buchan in his letters, are far removed from argumentative reasoning, and are not worthy of courteous comment.—I am, &c.,

MICHAEL DRURY.

[This must end the correspondence; the disposition on either side to conduct it without personalities having evidently become exhausted.—ED.]

SIR,—Mr. Michael Drury, in reply to my letter in your issue of August 5th, p. 184, says that "he shall be glad to be convinced that a larger air-pipe is more effective" than the 1 in. one which he advocates.

It appears to me rather strange that anyone who has anything to do with siphons, and who carefully thinks over the effect of the flow of water through them, should compare, as Mr. D. does, a "simple water-siphon" with the siphon-trap of a w.c. Let us look at them for a moment. Mr. D. says both have a long leg and a short one. Very true; but did it never occur to him that in the one case the long leg was rarely more than twice the length of the short one, and that the liquid was drawn through its small bore with comparative ease? While with the other, the long leg, which is the soil-pipe, is frequently 40ft. long, with a short leg of only an inch or two, and that through this siphon the water rushes in large volumes.

Surely Mr. D., upon reflection, will see his error, and, for the benefit of those he has unintentionally misled, acknowledge it.

Again Mr. Drury says, "Supposing the trap is unsiphoned, little or no harm is done, because the apex of the trap is free from accumulation." What! a w.c. trap fixed at the head of a cesspool drain unsiphoned, and liable to remain so for (sometimes) hours, during which time the contents of the cesspool may be stirred up from other sources, over and over again, and no harm done? Does Mr. Michael Drury believe this? I hope not.—I am, &c.,

DANIEL EMPTAGE, S.E.

Dane Hill Sanitary Works, Margate,
August 19.

UNTRAPPED GULLY-HOLES.

SIR,—Mr. Rawlinson recommends the Town Council of Brighton (see page 251) not to have the street-gullies trapped.

Perhaps if this were done throughout a town the sewer-gas would be "so diluted as to be practically harmless."

But Mr. Rawlinson admits that "an unpleasant odour might be experienced in the street." That seems to me a quite sufficient reason for keeping the gullies trapped, and getting rid of the foul air by pipes attached to, and carried to the top of, each house. It is much better that people should be over-fastidious about the smell of sewer-gas than that they should think it harmless. I know of a case where two persons, waiting one evening in the street for an omnibus, noticed a strong smell coming from an untrapped gully.

Foolishly enough, they did not move away. They were both taken ill with typhoid fever, and one of them died.

This, at any rate, was not "an imaginary grievance."—I am, &c., C. F. M.

DRY ROT IN TIMBER.

SIR,—There are nowadays only few naturalists who believe in spontaneous development of germs or fungi, and even these few admit the possibility of the propagation of diseases by wandering germs. It is, therefore, advisable to protect the timber against the contact with such materials as are likely to carry and develop the seeds which produce dry rot. However well-seasoned the timber may be when put in, such

materials as sawdust, hay, straw, shavings for sound-proofing, old laths for plaster-pugging, old soundboards and fillets for concrete-pugging, &c., will necessarily endanger the soundness of the building, because they are likely to contain the germs of putrefaction which is conveyed by any draught of air to all parts. Therefore, the greatest care must be taken about the material for pugging. Dry rot, where it can be got at, is easily to be cured. Wash the affected surfaces with a solution of chloride of magnesium ($MgCl_2$) of 8-10 per cent. specific gravity, and when the film is thoroughly soaked, scrape it off and burn it, wash again, and heat the wet surface with a movable gas-flame or otherwise until it is dry. During this process hydrochloric acid will evaporate, leaving in the pores of the wood small particles of magnesia (MgO). All vegetable life is now destroyed, and it will take some time before new germs can take root. The surface may be painted over with silicate of potash of 5 per cent. specific gravity to make the wood non-inflammable.—I am, &c., C. BAATSEN, C.E.

COOPER'S HILL AND THE ROYAL ENGINEERS.

SIR,—Glad to see the letter of "An Indian Civil Engineer" in this week's issue. I, too, strongly objected to the tone of "Jaalam Smith's" remarks, and regretted that I had unintentionally been the means of lighting up such a firebrand, as my only object in addressing you was to prevent that unwarrantable assertion of the Duke of Argyll passing uncontradicted, or at any rate unqualified—not to set on foot comparisons which are always odious.

I am certainly of opinion that taking the two classes, Royal and Civil engineers, the balance of education and general ability is on the side of the former, and during the whole of my service in India, I met with nothing but fairness and kindness from my superior R.E. officers, firm friendship, and cheerful companionship from those of my own standing, and hard work with willing obedience from the junior officers; indeed, it is this kindly feeling that prevents many civilians joining that agitation advocated by some of the P.W. department, and recently embodied in a letter to Mr. Gladstone by their representative.

There is undoubtedly great room for improvement in the pension rules of civilians which I hope to see carried out; but it must be remembered that the existing rules were framed at a time when the civilian element was not of that high standard that of late years has existed in the department, and that many of them in those days were not civil engineers at all, only clerks of works, and men of a similar class. Only since about 1867 has a better class of officer been introduced, i.e., from the commencement of the railway era and of Lord Mayo's Vice-royalty.

I cannot quite agree in thinking that animus should be against the R.E. corps, whether as a body or as individuals, but (if at all) against those individuals who hold the reins, whether civil or military. What good comes to the civil engineers when their cause is ably advocated by a Royal Engineer (as, for instance, by Colonel Sir Andrew Clarke, one of those fair and above-board officers who, I am thankful to say, are by no means scarce in the corps) if all his plans are vetoed by a viceregal council at the instigation of the Minister of Finance, a civilian? He is far more the stumbling-block of the C.E.'s than all the Royal Engineers in the department.

Much more could be said, but I will not take up more of your space.—I am, &c., PETER PLAYFAIR.

August 22.

The Mills Memorial in the parish-church of Yarmouth has just been completed. It occupies the entire west end of the great south aisle. The triplet of windows has been filled with stained glass, the Raising of the Widow's Son at Nain occupying the centre, and on either side are two female figures—Faith, Hope, Truth and Immortality. The wall-space has been decorated in colour with lilies and roses, chevrons and flowers, and beneath the sills is a dado of polished and enamelled slate.

A portrait of the Bishop of Salisbury—a gift of the diocese—was presented to the Bishop at his Palace yesterday. It is from the easel of Professor W. B. Richmond.

Intercommunication.

QUESTIONS.

[6630.]-**St. Botolph.**-Any information respecting the symbols, attributes, history, &c., of St. Botolph will oblige, as Audsley, in his book of Symbolism, does not mention them.-ASH.

[6631.]-**Oak Shingles.**-Will any reader kindly inform me as to the best method of laying the above, and the usual size and thickness, and describe how they should be specified?—A 10 YEARS' SUBSCRIBER.

[6632.]-**Contracts Signing.**-Can an architect, as the representative of the employer, sign contracts on behalf of same, and in so doing, will the contract be binding on the contractor and employer?—H.

[6633.]-**Curves in Perspective.**-Can any reader give the best means of drawing curves in perspective so as to make the lines firm and pleasing to the eye, and kindly state when instruments may be used, and what kind?—S.

[6634.]-**Priced Quantities.**-Is it necessary to sign and stamp priced quantities at the time of signing contract, so as to make them binding upon contractor and employer?—F.

[6635.]-**Architect's and Valuer's Licence.**-Is it necessary for an architect to have a valuer's licence in pricing and getting out builder's accounts or valuing materials in connection with contracts and buildings?—H.

[6636.]-**Books on Construction, &c.**-Will any one kindly answer the following:—What is the best work on building construction and carpentering (in the building trade only)? Is there any book which gives information on sketching architectural buildings and taking measurements of details? What is the best practical introduction to Gothic architecture?—ARCHITECTURAL PUPIL.

[6637.]-**Government Berths.**-Would any of your readers kindly let me know where I can obtain any book that will give me a list of the above that are connected with the building trade, with subjects for exam., &c.?—A. J.

[6638.]-**Engine and Fuel.**-I should feel much obliged if any reader would kindly reply to any or all of the following queries:—How much ordinary coal will a 12 H.P. agricultural engine burn in 10 hours? How much oak fuel in same time? The ordinary price of an efficient 12 H.P. engine, any maker, new? Its weight packed for transhipment abroad?—S. F. C.

REPLIES.

[6589.]-**Reservoir.**-I believe "L. L. U." would find a large filter-bed the best for use. I suppose that he would only fill it occasionally from the stream, and he would not be continually carrying off the water by his supply pipe. At first I would lead the water from the stream into the filter-bed, and when the latter was full cut off the supply; the water would then filter through into one of the storage chambers till the level was even on both sides, this would probably make both the filter bed and storage chamber both about two-thirds full; then as the establishment drew off the water from the storage-chamber, it would be advisable again to fill the filter-chamber from the stream, after which the supply would again be closed. This fresh supply would probably, with what remained from the first, cause a small quantity to flow over into the second chamber, and the total quantity would probably be the largest amount ever kept in the three chambers. It was stated in the question that the stream was sometimes befouled by a clayey admixture, in which state it would not be advisable to fill the filter-bed from it, it is therefore pretty well necessary that the chambers should hold a supply for a week or even longer. If the filter-bed were quite full not allowing for filtering material or any empty space at surface, it would hold nearly 3,000 gallons, but as this must be considered, the total amount would not be 2,000 gallons or less than 300 gallons per day for a week's supply. This would of course be increased were a second quantity of water run into the filter-bed, after the first had pretty well filtered through, and on the other hand the amount would be decreased by an act of forgetfulness or bad weather coming on when not expected, and preventing the owner from taking a fresh supply from the stream when he intended. There is no connection between the size of the chambers and the size of the supply-pipe leading therefrom. A depth of two feet would be sufficient for the filtering material, of which 6 in. should be charcoal. I believe vegetable charcoal would be cheapest, and is good enough for the purpose, as the filtering material would be easily renewed. I am unable to inform your correspondent where to obtain it, but a contractor would probably know.—HUGH McLACHLAN.

[6597.]-**London Bridges.**-“Beta” will find a very good account of the construction of Charing cross railway bridge (over the Thames) in one of Weale's series entitled “Civil Engineering,” by Lsw and Burnell, with recent engineering works by D. K. Clark, M.Inst.C.E.—THOS. R. DAY.

[6611.]-**Measuring.**-In brick buildings the different measurements of heights can be easily taken with sufficient correctness by counting the courses, and then allowing four courses to the foot, or, more exactly, by measuring one dozen courses and calculating proportionately. Stone ashlar work and coursed rubble can at times be taken in the same manner, if it is found that several courses average the same all up, but seldom so correctly as in brickwork. Heights are occasionally taken by a mere judging of the eye so to speak, that is an elevation is carefully sketched in as correctly as the eye can judge and the hand perform, one or two measurements are then taken where accessible, and the remainder calculated therefrom proportionately to the drawing. It is very seldom this can be correct, the height thus found being generally too low, owing to the shortening of its appearance explained by the laws of perspective, yet I have seen one or more cases of old buildings illustrated in the BUILDING NEWS were thus taken. Otherwise inacces-

sible heights must be taken with optical instruments or calculated by trigonometry and mathematics.—HUGH McLACHLAN.

[6613.]-**Setting Pencil Sketches.**-I have met with the same experience as “Toad in a Hole,” and am sorry I cannot give a remedy after the mischief is done though I hope I can to prevent it in future. In my opinion the reason of these spots is a want of care in the setting of the sketches, it was so in my case. After covering the whole of the sketch with the diluted milk, I roughly drained off the superfluous liquid and left the drawing to dry; the result was that in so doing the largest part of the liquid not drained off settled in one or two places, after which the water was drawn off by evaporation, leaving a creamy deposit causing the spots described in the question. In my case I was careless as to the appearance of the sketches, being anxious only to preserve the pencil lines and figuring; I have not looked at them for the last few years, though I could get at them if I wished to. If the liquid were carefully drained off, and afterwards any settling removed during formation with a brush, I believe no such defects would be found.—HUGH McLACHLAN.

[6614.]-**Chalk in Concrete.**-Chalk is suitable for the purpose intended. I have seen it similarly used in the interior of the cloister walls of Westminster Abbey. The medieval builders appear to have been fond of a concrete core for their walls with ashlar facing. The chalk should be considered as replacing some of the larger ingredients of ballast or chippings; it is necessary that it is not open to the weather, nor used when great weight has to be borne, being a soft stone only. Proportions: One of cement, three of chalk, and six of ballast and sand.—HUGH McLACHLAN.

[6616.]-**Order for Additions or Deductions.**-It is not necessary to have a form when giving written orders, any letter or note expressing what is required and properly signed is sufficient for the purpose. The contractor would be sure to keep any order for extras as a voucher; but were he dishonest and to deny receiving any order for deductions it would be necessary for you to prove his receipt of the order, this may be done by sending it in a registered letter, or by having it delivered to the contractor by two witnesses.—HUGH McLACHLAN.

[6619.]-**Carpentering.**-In addition to information already given, the best glue, besides being hard, somewhat transparent and of a bright amber colour, will generally be found to be in thin cakes, very different from the thick black-coloured cakes of common glue which can be had at about half the price of the best. In preparing it, it should be as described by “L. L. U.” and W. Jackson, well soaked; water should not be mixed with it. I generally prepare glue the day before I require it, giving it sometimes 24 hours to soak, it should have at least six, when well soaked pour off any water remaining that is not absorbed or carried off by evaporation, otherwise your glue would be too thin. Cover the joints well with the hot glue after it is melted, then in fitting press out as much glue as you can, for the less glue that remains in pressing a joint well together the better, though it should not be stunted before fitting. Do not mind wasting the glue a little.—HUGH McLACHLAN.

[6624.]-**Traps.**-The simplest form of trap is the ∇ , the section being thus— the water resting in the hollow at the angle of the bend. The ∇ -trap is exactly the same in principle as far as I know and has an extra bend, its section being

the water occupying the same position as in the last. The ∇ -trap is a very slight modification of the ∇ , but having the advantage of a deeper water seal and a sharper angle to check the movement of the contained water during the movement of siphonage or the emptying of the trap of water, the section is—

It consists of a chamber shaped like the letter ∇ (whence its name) but having a division to check the water during siphonage, it has also an opening to clean it out when needed. There is one other variety of trap much recommended, Smeaton's “Eclipse,” the section being thus—

The outer line is similar to that of the ∇ and ∇ -traps, but it has the division of the ∇ -trap to check siphonage. In the sections before given A is every case make the inlet and B the outlet. The easy curves of the ∇ and ∇ -trap assist the cleaning of them but makes siphonage easier, whilst the sharper edges of the ∇ , ∇ , and Eclipse traps make the action of siphonage more difficult, but render them more liable to fouling. This shows that what is beneficial to self-cleaning assists siphonage and vice-versa, therefore each has its advantages and disadvantages. All traps should be ventilated to carry off foul gases and hinder siphonage, this can be done with all the traps where marked X. All traps are liable to fouling, and provision is made in the best of each kind where marked O for this purpose some opening from the side, some from below, and the ∇ from above.—HUGH McLACHLAN.

[6622.]-**Building Construction.**-In reply to “F. P.,” surely a great city like Edinburgh is not with-

out its school of art, and I have no doubt that with very little trouble he would soon find such a school where he would obtain instruction on above.—FRED. J. FREEMAN.

[6623.]-**Building Construction.**-There is a science and art school at Edinburgh in connection with South Kensington, where I expect building construction is taught; possibly by inquiry on the spot better information may be obtained, professional schools being as a rule superior to the Governmental.—HUGH McLACHLAN.

[6627.]-**Photos. Pencil-Sketches.**-Soak the photos in water till they leave the mount freely. Let them lie in water all night if requisite. I have unmounted a great many in this way, of all sorts and sizes, and have not had one injured. To set charcoal, crayon, or pencil drawings, use bleached gum-mastic, dissolved in methylated spirit or spirit of wine, blown over the drawing with an ordinary odorator, purchased at a chemist's. As much gum mastic should be put to the spirit as will dissolve. I usually use methylated spirit as being cheaper, but for important drawings should use spirit of wine. This method is far superior to any which requires the drawing to be washed over.—JOHN TRAVEN.

[6628.]-**Styles of Architecture.**-In reply to “F. B. P.,” read “Styles of Architecture,” by T. Talbot Bury, F.R.I.B.A., &c. Illustrated, 2s. Crosby Lockwood and Co. “Nicholson's Architecture,” 15s. 6d., and “Rickman's Attempt to Discriminate the Styles of Architecture” (with considerable additions), by J. H. Parker, F.S.A., 13s. The two latter works may be obtained from Mr. B. T. Batsford, 52, High Holborn, London, W.C.—FRED. J. FREEMAN.

PARLIAMENTARY NOTES.

OPENING OF MUSEUMS ON SUNDAY.—Mr. Alderman Fowler, last week, asked the Vice-President of the Council whether he was aware that works of art for loan exhibition from South Kensington had been publicly exhibited on Sunday; and whether, in view of the fact that Parliament had repeatedly refused to sanction the opening of the State museums on Sunday, he would give directions that works of art should be loaned from the South Kensington and other museums for exhibition, only on the condition that they should not be shown on Sundays so long as South Kensington and other State museums remained closed. Mr. Mundella.—I am not aware that works of art by South Kensington have been exhibited on Sunday. No statement to that effect has reached the Department. Our general practice is to make loans to museums established by and under the control of municipalities or the managers of local schools of art (hear), and I should consider it a very improper interference with the rights of municipalities to refuse a loan on the ground suggested by the hon. member. Since coming down to the House, I have heard that the municipal museums of Manchester and Birmingham are open on Sunday afternoon; but the hon. member could not expect us to refuse loans to those important centres on that account.

DECORATION OF THE HOUSES OF PARLIAMENT.—Mr. Lefevre, on Tuesday, in reply to Sir H. Tyler, said it was originally intended that there should be four pictures painted by Mr. Herbert, R.A., for the Peers' Robing-room. When the second picture was ordered it was expressly stated that the Government would be under no obligation to give any further order. The picture entitled “Moses,” already placed in the Robing-room, had given satisfaction. The second picture, entitled “Daniel,” had not yet been placed, and it would be premature to express an opinion about it.

LEGAL INTELLIGENCE.

ST. MARGARET'S CHURCHYARD, WESTMINSTER.—An application was made on Tuesday to the Chancellor of the Diocese of London, sitting at the Chapter House, St. Paul's, by Canon Farrar, the rector of St. Margaret, Westminster, and the churchwardens, for a faculty or licence to make improvements in the churchyard. There was no opposition, and the Chancellor said he had no hesitation in granting the faculty. There was one feature in it which was novel, and that was that his authority was asked to allow the tombstones to be covered over with soil. It was the first time he had been asked for such an order, but after the evidence given by Mr. Pearson, he could have no doubt that the inscriptions would be best preserved in that manner. He should, therefore, allow the faculty to be issued, and should direct a provision that the earth should be removed, if it became necessary, to examine the actual inscription on a particular tombstone, as a copy of the tablet might not be added in a court of law.

ST. JAMES'S CHURCH, PADDINGTON.—An application by the rector and churchwardens, for a faculty to reconstruct the body of the church, again came before the court on the question of hearing. Mr. Gainsford Bruce appeared for the petitioners, and Mr. Blakesley for the respondents. It was urged that the case should be heard without further delay, so that the works might be commenced in the present vacation. The learned Chancellor gave his reasons for proceeding with the case during the present vacation, and proposed that as Mr. Street, the architect, was about to

leave for the Continent, his evidence should be taken. Mr. Blakesley protested against the hearing of the case, as he was not sufficiently prepared. Mr. G. E. Street explained the plans he had prepared. He had several tenders for the work, and had no doubt that it could be accomplished for the sum subscribed—namely, £15,000. Mr. Blakesley declined to cross-examine Mr. Street, as he did not know what his witnesses would say. It was out of no want of respect to the Court that he had so acted. Mr. Howell, a parishioner and an architect, entirely confirmed the evidence of Mr. Street. Mr. Blakesley briefly cross-examined the witness, and the case was then adjourned.

WATER SUPPLY AND SANITARY MATTERS.

THAMES SEWAGE.—A deputation of gentlemen residing on the banks of the Thames between Gravesend and Woolwich, submitted to the President of the Local Government Board, last week, that the sewage from the Crossness and Barking outfalls is creating a great nuisance, and is deleterious to health. Mr. Dodson remarked that there was no evidence of increased sickness; but he promised to consider the statements that had been made. According to the report of the Thames Conservators, they have, with the object of preventing pollution, caused a rigid inspection to be maintained over the river, and likewise over the tributaries within ten miles of the Thames. These sewage works at the various places above the intakes of the water companies having been completed; the sewage formerly discharged directly into the river has been diverted. Occasionally, some defect in the action of these works is discovered, when steps are immediately taken, by legal proceedings, if necessary, to cause the defect to be remedied. On the tributaries many offensive and injurious discharges have been stopped, and several local authorities and other persons are now under the notices required to be given by the Conservancy Acts to discontinue the flow of sewage and of offensive and injurious matter into the affluents of the Thames. Should it be found that legal or other difficulties impede the action of the Conservators in carrying out the complete purification of the tributaries, the Conservators trust they will be able to obtain the sanction of Parliament to such additions to their present powers as may be deemed necessary to insure the thorough purification of the streams flowing into the Thames. The periodical surveys of the river having shown that shoals had been formed in Half-way Reach since the opening of the Metropolitan Sewage Outfalls, the Conservators deemed it advisable that an inquiry should be held under sections 20 and 21 of the Conservancy Act, 1870. That inquiry was limited to the question whether a sufficient obstruction to the navigation had been caused to render the Metropolitan Board of Works liable for the removal of such obstruction. This question the umpire and arbitrators had decided in the negative. It should be noticed, however, that the question of the pollution of the river could not be raised in this inquiry under the sections of the Act of 1870. During hot weather, when there has been little rainfall, complaints of the pollution of the river within and below the metropolitan district frequently reach the Conservators. The pollution thus complained of is indicated by the offensive odour and highly discoloured state of the water. It must be remembered that Kingston and Richmond, and other places below the intake of the water companies, still pass their sewage into the river, the penalties for their doing so having been suspended by the Legislature to give time for overcoming the difficulties of carrying out a complete sewage system for this district. Although the discharges from these places may in some degree affect the purity of the river near the metropolis, the Conservators think it can hardly be doubted that the chief cause of the polluted state of the river within and below the metropolis arises from the discharge at the outfalls and storm outlets of the Metropolitan Board of Works, in whose district ordinary sewage is exempted from the provisions of the purification sections in the Conservancy Acts.

STAFFORD WATER SUPPLY.—The boring operations on Stafford Common having proved a failure, a special meeting of the town council was held last week to receive a report from Mr. McCallum, the borough surveyor, as to the best means of increasing the supply. Mr. McCallum reported that either of two plans could be adopted—the one being to obtain water from the South Staffordshire Waterworks Company, and the other to pump water from a well at Berkswich, less than two miles from the borough boundary. The initial cost of the Berkswich scheme would be about £9,500, including a provision of £3,800 for reservoir, and the annual maintenance would be about £1,171 per annum. The use of the South Staffordshire Company's water would cost a capital of about £7,456, chiefly for mains from Huntingdon, and the annual payments for 400,000 gallons of water at

34d. per thousand gallons, and maintenance, he estimated at £2,645. By 14 votes to 3 it was decided that a trial boring be made at Berkswich at a cost not to exceed £500, the work to be executed by Mr. Timmins.

EVESHAM.—The Town Council of Evesham decided on Wednesday on a scheme for obtaining water from Snow-hill Valley, in the Broadway Hills, six miles from the town. The cost of the works is estimated at £10,250. The terms asked by Mr. Edgar Flower, of Stratford-on-Avon, the owner of the estate, were very favourable to the Corporation.

STAINED GLASS.

WESTERDALE CHURCH.—DUNCOMBE MEMORIAL.—A new two-light stained-glass window, dedicated to the memory of the late Colonel the Hon. Octavius Duncombe, Lord of the Manor of Westerdale, and for twenty-five years M.P. for the North Riding of the county of York, was on Sunday last unveiled by the rector, the Rev. J. R. Ellis, in the presence of the Earl of Mulgrave, the Hon. Lady Caroline Duncombe, &c. The window is in the nave. Each light is divided into two compartments by decorated bordures, allowing the introduction of four groups, illustrating respectively the "Nativity of Christ," "His Baptism in Jordan," "Crucifixion," and "Ascension." The colouring of the subjects alone is rich, the effect enhanced by a white-diapered background, the general style and tone being (in architectural conformity) rather severe and antique, relieved by bordures of apple foliage and fruit. The window is from the studio of Messrs. Powell Bros., Leeds, Mr. H. Perkin, of Leeds, being the superintending architect. At the same time was unveiled another and smaller painted window, over an entrance porch, of which the subject is "Christ Blessing Little Children," dedicated to the memory of two infant children of the Rev. John Rathbone Ellis (the rector) interred at St. Asaph. This, with a larger Ellis family memorial window, antecedently erected, are also by the same artists.

CHIPS.

A very handsome decorated reredos has just been sent out to Sydney Church (N.S.W.), designed and executed by Messrs. Jones and Willis, of Birmingham and London.

Mr. R. Morgan, C.E., an inspector of the Local Government Board, held an inquiry at Brompton, near Chesterfield, on Friday, to consider an application from the Brompton local board for sanction to borrow a further sum of £1,575, to complete the sewerage scheme, upon which £10,000 has already been applied for and expended.

The memorial-stone of a new Baptist chapel was laid at Newtown, Radnorshire, on Wednesday week. The style is stated by a South Wales paper to be "after that of Spurgeon's Tabernacle," and the cost, including land, £8,000. Mr. George Morgan is the architect.

The memorial-stone of the new Mechanics' Institute at Derby was laid on Saturday week on a site adjoining the new Free Library.

Hughenden church, it seems, is really to be decorated to the memory of Lord Beaconsfield. The paragraphs say that one of the features will be four new windows, to complete "a series of designs illustrative chiefly of angelic appearances recorded in Scripture." The late earl, it will be remembered, says the *Guardian*, declared himself, at Oxford, as being "on the side of the angels."

The guardians of St. Pancras are about to erect Quarantine Wards at the parish schools at Leavesden Woodside, near Watford, so that the children sent weekly from the workhouse shall undergo a three weeks' quarantine before entering the schools. Mr. H. H. Bridgman is the architect.

Shirley Church, near Southampton, is now being erected by Messrs. Stevens and Sons, of Southampton. The Purbeck marble columns are the same as used in the restoration of Salisbury Cathedral, and also the rouge royal columns were supplied by Messrs. J. W. Bird and Son, of the Euston-road.

The foundation-stone of a new Masonic hall was laid at Antrim on Saturday, Aug. 20, by Sir Charles Lanyon, with full Masonic ceremony. Mr. William J. Fennell, of Belfast, is the architect.

By a lamentable boat-accident at Sidmouth, in Devon, Mr. John Churchill and a companion have been drowned. Mr. Churchill was hurried upon the 17th inst. His funeral was attended by several hundred of his fellow-workmen and friends. He was outdoor foreman to Mr. Harry Hems, of Exeter, and had only held that position since the death of Mr. Stephen Shute, a notice of which event appeared in our issue for Sept. 17th, 1880. Churchill, who was only 28 years old, leaves a young widow.

Our Office Table.

The biggest thing on record—in obelisks this time—has, as usual, been achieved by the Yankees. Mr. H. Q. French writes as follows to the *New York Times*:—"In view of the attention recently given to the obelisk brought and set up in Central Park at a reported expense of over 100,000dols., the height of which, exclusive of pedestal, is 69ft. 1in., the following may be of interest to your readers: At our Westerly (R.I.) quarries we have just obtained a single stone 150ft. long, 10ft. wide by 8ft. thick, weighing over 1,000 tons, and the stone was loosened by one oblong blast-hole in such a simple and perfect manner that the theories and conjectures advanced by many as to the methods of the Egyptians appear absurd. Here is a stone that could be finished and erected in our own progressive land which would far exceed the largest stone the ancients are so far known to have handled. The obelisk of the most extraordinary proportions of which ancient writings give us any record was that of Queen Semiramis, described by Diodorus Siculus: as 125ft. in length and 5ft. in breadth and thickness. The block I mention contains over 12,000 cubic feet, and would be worth, cut into pieces, about 30,000dols., while if we desired to use it in its present shape the value would be far greater. I am quite positive this piece could be brought to this city, finished, and erected for about 150,000, but our demand for this granite is so great that we shall soon cut it into smaller pieces, with a possibility of getting another that would equal, if not excel, this monstrous stone."

The first general meeting of the British Association will be held on Wednesday next, at 8 p.m., in the Exhibition Building, York, when Prof. A. C. Ramsay, LL.D., F.R.S., V.P.G.S., Director-General of the Geological Survey of the United Kingdom, and of the Museum of Practical Geology, will resign the chair; and Sir John Lubbock, president-elect, will assume the presidency, and deliver an address. A complete programme of the local arrangements in connection with this, the jubilee meeting, has been issued by the hon. local secretaries, the Rev. T. Adams and Dr. Tempest Anderson. It contains information on all subjects specially connected with the meeting of the Association, such as places and times of meeting, and some account of the excursions. A short chapter on the zoology of Yorkshire is contributed by Mr. W. Eagle Clarke and Mr. W. Denison Roebuck, and one on the botany of the district by Mr. Thomas Gough, B.Sc. An interesting sketch of the York founders of the Association is by Archdeacon Hay.

A CORRESPONDENT at Rome writes:—"The demolition of the bakers' ovens and other wretched edifices built up against the posterior portion of the Pantheon has revealed the grand old walls which connected it with the *thermæ* of Agrippa. Notwithstanding that plans and engravings of these remains are to be found in the works of Fea and other well-known archaeological writers, their existence has taken the modern world of Rome by surprise, and there has been much controversy as to whether they should be allowed to remain or not. The modernisers of Rome, no matter what is sacrificed, have been urgent in demanding their destruction that the round mole of the Pantheon might be completely isolated; but the arguments of Roman archaeologists and scholars, jealous for the remains of the ancient city's grandeur, have apparently prevailed. It is true beyond dispute that to the just requirements of the capital of united Italy all other considerations must bow, but it does not at all follow that Rome should, by the commencement of the 20th century, be converted into a fifth-rate Paris."

It seems to be a fact, deduced from French Government statistics, that the exportation from France to this country of productions having an artistic element has only, in the last twenty years, increased 15 per cent., whereas importation into France of similar goods has increased to the extent of 488 per cent. This result is mainly credited, by those interested both in England and France, to the English schools of art. In a report this year, to the Chamber, on the estimates for the fine arts, M. Lockroy says plainly, "England has become our equal in furniture and ceramics."

THE BUILDING NEWS.

LONDON, FRIDAY, SEPTEMBER 2, 1881.

HOLIDAY WORK.

THE season, given up to archaeological rambles and sketching tours, is with us; and, in spite of the weather, some work has already been accomplished, as our pages during the last few weeks have borne ample testimony. It was rather unfortunate that the same ground was chosen for the Architectural Association's excursion this year, as had been selected by the British Archaeological Association, though, after all, each of these societies has its own point of view, as each has travelled over much the same ground, but by somewhat different paths. Probably no richer district could be found for picturesque scenery and archaeological investigation than that intersected by the Severn valley. Geologically, the red sandstone formation gives a character to the buildings of the locality, even as far as Bridgenorth, while to the architect few counties yield so rich a harvest of remains in Norman, Transitional Norman, and later styles as Worcestershire. From the archaeologist's point of view, evidences of antiquity are of far greater concern than the most beautiful examples of style, and we cannot be surprised if a few of the visitors indulged in giving free expressions of regret at what restorers had done. But we are glad to see that these meetings are occasionally tempered with common-sense, as well as a veneration for antiquity, and we note with pleasure the sensible remarks made by the Dean of Worcester, in his inaugural address at Great Malvern, which we fully reported last week. The Dean asked rather satirically whether the restoration and preservation of ancient buildings are not both alike the result, and in some degree the cause, of a great want of originality in the present day, and he very truly instanced the freedom and boldness of those who altered and enlarged the cathedral of Worcester. They did not hesitate to add to the Norman cathedral the Early English choir; nor did the 15th-century builders scruple to insert into the Norman walls of the chapter-house, windows of a totally different character, namely, contemporary Perpendicular.

The Dean's explanation seems the only one. Our habits of restoring and preserving have not certainly done much to make architects think for themselves, and such careful and minute study of old work seems likely, as Dean Alwyne Compton said, "to check any freshness of artistic thought." Our readers will peruse with satisfaction the remarks made by the president of an archaeological meeting, in which he admitted that, even as regards Renaissance work, the copying of ancient forms and decorations has had the effect of destroying style altogether. The only hope of advancing is, as we are told, in the employment of new materials, and in new methods of treating the old. There is also a good deal of truth in the statement that "perfection of workmanship," or neatness and finish, combined with cheapness, has tended to destroy fine art, and to make people value the imitative power of making a thing more than the thought. The younger architects and enthusiastic archaeologists will do well to remember that the old architects, like William of Sens and William of Wykeham, had not the facilities for travelling they have; that there were no annual excursions, and that the work of the Saxon or the Roman was not copied and revered as we are now doing theirs. Viewed in the light of the

past, this reverential mood has not been an unmixed gain to us.

Our more immediate purpose now is to dwell upon the actual results and possible work of the holiday season. We do not deny that a well-selected tour on the Continent, or even a flying visit through some parts of England may be the means of infusing some freshness into the mind of the young architect; but we have some misgiving as to whether it affords him much help or prepares him for original work. A few students take council together and set off on a sketching expedition, portfolio in hand. They take all the churches and remnants of monastic buildings to be found in their route, which they sketch to their heart's content, and come home laden. The sketches are labelled and put by for future reference; but when the sketches are looked at a few months or years hence, it is discovered that, by a most provoking omission, the measurements are not given, and what might have been usefully taken as a detail, becomes only of interest as a sketch. A capital or an arch moulding drawn from a clerestory has not been noticed with sufficient care, and has been taken for work on the ground-story, and the very dimensions of importance, diameter of shaft, its height, or position in the building, have been neglected. A more frequent source of vexation is that a sketch-plan, however rough, has not been made, and the whereabouts of a particular moulding or detail is lost. As for the general sketches of exterior, they are always interesting to look at; but their real value, save when finished as drawings or water-colour sketches, becomes of no account through the amount of uncertainty attached to them. But, for all that may be said in disparagement of sketching—and we are only alluding to hasty sketches—it is better that impressions be fixed on paper than lost to view altogether. The purport of our remarks is simply that, for practical architectural purposes, the rough, unfigured sketch has little value, and that for real instructive sketching of old work, the student ought to go prepared to do hard work, and to make his sketching so perfect, and his details so connected, that he can return home and redraw to scale the church, or portion of it, he has been engaged upon. For this object, it of course becomes necessary to go provided with a tape as well as a rule, a ready means of taking heights, and of making angular measurements. The sketch-book ought to be of good size, not a mere pocket-book, and the necessity of a straight-edge, scale, or set-square hardly needs to be insisted upon, though not perhaps absolutely, for all sketchers. Sketching at random is a pleasant way of employing the time; but it is, after all, rather aimless and certainly of little use. The subject is perhaps a capital or a boss, an arch-mould or a bit of tracery. Its chief value to the student is the exercise it gives him, the power over the pencil and grasp of subject it affords, and even such work is a gain; but why not take a little more time in fixing the positions of these features by reference to their height, and to their place on the plan? The student, during a hasty perambulation, is likely to commence sketching the least-important part of a building; in his eagerness to "do" something, he takes a capital or a piece of carving, but perhaps misses the most important point after all. At Worcester Cathedral, for instance, recently, we should not have been surprised to find him sketching a bit in the cloister, but neglecting the fine apsidal crypt of Norman date which ranks with that of Canterbury, and is a somewhat unusual feature in England. Again, how often we see a prettily-sketched capital and bit of arch-moulding, but without any evidence of its height above the

paving. The plan of the shaft and its dimensions have been overlooked, and there is nothing to indicate the span of arch or its proportions; and these omissions lead us to speak of the importance of careful plans and sections, as well as perspective sketches.

The slap-dash mode of doing work rather in vogue with younger members of the profession may make any advice about pursuing a method in these excursions extremely unseasonable; but if architecture is to be learnt by these tours, the details of plans and measurements ought not to be thought irksome. We may, therefore, offer a little advice on a few points about which correspondents frequently ask for information. The first thing to do in "attacking" any given subject is to thoroughly examine it; to walk round and look at the projections, marking any new feature in the exterior of the building; to thoroughly probe any part which seems doubtful, and afterwards perambulate the interior. This superficial examination made, the sketcher may begin to take a few leading dimensions of the ground-plan, plotting to a small scale the chief boundaries and piers, or if time will not permit of this, making a rough hand-sketch, and figuring the principal dimensions, especially those having reference to the part he is about to delineate. It is very necessary to mark the widths of all arches, door, and window openings, and by a few measurements to fix the positions of them in reference to an angle or cross wall. Careful observation of the salient angles and points will be time well spent, and insure more accuracy than a number of small dimensions; and we, therefore, impress upon the reader the importance of a general plan by which any geometrical proportions may be likely to be discovered. Centre lines and angles ought to be laid down in plotting a building with any accuracy, as they may disclose peculiarities of setting out and planning which may escape mere observation. It is a good plan to range lines of walls, arcades, &c., and to take offsets from them. When a fair plan has been made, parts may be lettered and details drawn of them to a large scale, and we would dwell upon the necessity of not omitting dimensions of height in sketching. It is a good plan, when time allows, to roughly plot the section or any elevation, filling in details at one's leisure. Many sketches are worthless from omission of these requirements. It is more useful to draw careful sections of mouldings to a scale than by the eye, and we here insist on sectional accuracy. For this purpose it is desirable to be provided with a small builder's level, but a plumb-line and spirit-level, which can be carried in the pocket, is sufficient for most purposes. These, a tape, and a two-foot rule, are all the plotter requires to take off the mouldings and their projection with accuracy. No capital can be drawn properly without taking the projection of each moulding from a plumb-line held close to the abacus, by which also the vertical heights can be ascertained. It is impossible to judge by the eye the projection of cornices, though fair proportional sketches may be made of them.

The greatest and sometimes insuperable difficulty in sketching churches is to measure the height of wall-plate, ridge, or, indeed, any part not accessible by a rod or tape. Various hints have been given, such as throwing a long line or string with a ball attached to one end over the ridge of roof, by which, if the other end of string is held down to the ground, straight with wall, and the ball on the other side is allowed to descend to the eaves level, the sides of roof and vertical height to eaves can be obtained, as the width is known; but this plan is not always practicable where aisles exist. The plan we have generally adopted is easier and less trouble-

some, as a rather stiff-jointed rule answers the purpose, and this is always supposed to be carried. Let it be required to take the height of vault: as the nave is generally accessible throughout its length, we walk from the west wall eastwards, till we reach a point at which an angle of 45° from the level of the eye is made to "sight" the ridge level. By measuring the distance from this station to the said wall, and adding to it our own height or level of eye, we obtain approximately, and quite accurate enough for plotting, the height of the ridge, as we know that the two sides of such a triangle are equal. A rule opened to an angle of 45° is the only instrument necessary, but any angle or set square may be used, and the sides can either be plotted or calculated by a simple rule of proportion. When the base of an object like a spire is inaccessible, there is another rule which is easily remembered, and that is to lay the triangle on the ground, or set it out horizontally by measuring any convenient distance at right angles to the line connecting the observer's position with the object. Two sides of a right-angle triangle being obtained, a second triangle is soon made, and then the sides are easily calculated by the well-known proportion. It is generally, however, to obtain vertical heights whose bases are accessible that the sketching student is in most need, and the former plan is sufficiently accurate if the horizontal side of triangle is held perfectly level. Arches are another trouble to the plotter. An arch may be generally sketched with tolerable truth; but it is desirable to obtain, if possible, the points of striking. To do this, the curves must be plotted with accuracy, or, at least, offsets from a chord-line are necessary. It may be well to remember also that the old masons seldom started their curves directly from the impost line; and in taking the heights the real springing-level ought to be found; also the projection of archivolt from the line of shaft. The apex of an arch, from the spring line of course, is necessary, and for rough purposes this height and the span alone may be sufficient. It would be unnecessary to enter into all the little difficulties experienced in drawing from measurement; the leading ones we have already noticed. One word is necessary to guard against confusing the points and lines from which dimensions are taken, and centre lines are sometimes taken for surface lines and *vice versa*. It is generally better to fix upon certain datum lines both for the plan and the heights, such as a wall line and the pavement level, though as many check dimensions are desirable as can be introduced. Much disappointment and vexation is saved by being able to plot roughly the main plan and elevations in the building, filling up the detail at leisure, and by not leaving one place till these dimensions have been worked out. Jointing is often left out of sketches, an omission which detracts greatly from their practical interest. Every architect knows the importance of joints in stonework, and many apparently inexplicable features are explained when the jointing and construction are given. If there is one fault in the work done by the tourist artist, it is the haste evident, and the desire to get over a lot of ground in a short time. It is better to remain in one city than to make a scamper over a whole country, and there is the mischief that was feared by the president of the Archaeological Association at Malvern, that all this research into old things may tend to check any freshness of thought. If on no other ground, we hope that future explorers of old buildings will attempt to understand the intention of the old builders, as well as what they have left for our admiration, and not be content with disjointed fragments of a once beautiful whole.

HOUSES TO LET.

BUILDING a house to live in, and building one to let on lease, are two such very different things that we are inclined to dispute the old aphorism which says, "Fools build houses and wise men live in them." In these days of gigantic building speculations the ready-built house does not add to the weight of the old saw. From footings to roof it is so perfect a deception that the ordinary tenant wonders why people are so stupid as to give themselves any trouble about building; when every comfort and convenience has been arranged to suit the taste of the most exigent. There is plate-glass in the bay windows, tessellated tiling in the vestibule, a parquet hall, rooms of good size, a bath-room "with hot and cold water," lavatory, gas-fittings, and electric bells—every convenience, in short, that it is possible to get in an advertisement, and what more can the most exacting applicant desire? It must not be imagined we are pleading for the employment of architects, for in many localities professional assistance has not mended matters much. The chief thing to deplore is that would-be tenants are so easily led into a trap, that they still continue to take houses without examination, and that they neglect to avail themselves of the means of protection. Outside appearances, and an outer semblance of cleanliness and comfort, still lead men and women, who in other relations of life would be a match for imposition, into taking premises utterly incapable of affording comfort or even protection against the weather. People still continue to be led by outside show: a little cement ornamentation or stone carving about the windows, or glass panels to the front door are sure to find admirers, cover a multitude of defects, and essential blunders of construction and arrangement pass unnoticed. It is to be regretted there is not some means of certifying the condition of houses so that intending tenants may be guaranteed that they are entering premises in a state fit for occupation. Unfortunately, stringent regulations have hindered rather than promoted buildings of a suitable character, as some respectable builders hesitate to erect houses in neighbourhoods subjected to inspection. Mr. Cresswell's proposition to register or certify all houses in the same manner that the seaworthiness of ships is certified would lead no doubt to the abandonment of tawdry embellishments and false ornamentation, it would compel at least the builder to spend more on the essential requirements of the house, and in its turn a more wholesome competition would be promoted. Left to themselves, landlords will not trouble about the wants of tenants, and we cannot hope for a decided change till the law gives facilities for the purchase of freehold land by tenants. Building societies were started with the avowed object of encouraging the working classes to purchase their own land and houses; instead of which many of them have been multiplying houses, and doing the very thing which they were intended to prevent. They are now entered as a means of investment, the subscribed funds helping to increase the class of borrowers and small builders. The renter of a house has to pay heavily for his accommodation; he has to pay, in addition to the full interest on the capital expended in erection, a sum for the interest of money borrowed, and a certain amount for the loss of defaulting tenants and non-occupation.

Turning to the practical examination of houses built to let, we find builders more stingy than ever in parcelling out sufficient breathing area. In a new suburb we lately inspected in the locality of Brixton, a row of houses has been built to fill up a margin of land between a new road and an old

property. The latter is bounded by a high wall some 12 or 15ft. high, and the houses are built within 7 or 8ft. of the wall in the rear. In places they are only one room deep, except a kitchen at the back on one side, and the front wall is so close to the railing that any mischievous person or boy might touch the window-glass. These cramped areas, back and front, are cement paved, probably for the sake of cleanliness, and there is a very considerate covenant in the agreement that "no fowls are to be kept," an injunction we should think hardly needed. Other more essentially necessary points will be found neglected; and we are told few tenants care to inquire how the drains are laid, whether they go through and under the floors or not, and with regard to disconnected waste-pipes and ventilating gullies, they are things which no one, except perhaps a sanitary inspector, would care about ascertaining. One of the most objectionable things about these houses is, that the refuse or ashes have to be brought through the house to the road, sometimes through the scullery and kitchen, and generally the front passage is the only way. It is rather a perverse piece of builders' folly which provides for a coal-plate just in front of the main entrance, while no provision is made for the removal of the most obnoxious part of the domestic refuse. Ventilation under floors, and damp-proof courses, are generally mere pretences; air-bricks, inserted in front, are often nothing but shams, as the perforation is seldom continued through the brick wall, and a circulation of air is impossible with the usual arrangements. We often see the air-brick placed so low down that it becomes an opening to admit water to soak under the floors, and in this manner it becomes more dangerous than useful. As a consequence, the basement-flooring generally decays and sinks, its original level being indicated by the crevices under the skirting, and the position of the hearthstones. Although sanitarians have been constantly indoctrinating the principle of cutting off all waste-pipes from the drains, not one house in a hundred shows that the slightest attention has been paid to the teaching; the kitchen sinks continue to give vent to the most poisonous emanations, and the lead pipes, instead of being cut off outside and allowed to discharge into an open gully, are taken through the floor, as if builders were determined to adhere to the practice of their forefathers. The same disrespect for improved sanitary details appears in the closets and lavatories; all the principles that have been inculcated appear to have been quietly ignored by the builders of these modern dwellings, for we find unventilated soil-pipes incased or buried in inner walls with bad-seamed joints; pan-closets imperfectly trapped, waste-pipes from lavatory and bath entering the drains, and cistern overflows which allow sewer-gas to permeate the drinking-water.

There is another class of defects, though of less importance to the health of the tenant, to which it is necessary to call attention—we mean the poor joinery and cheap fittings throughout the house. Of course, no such thing as Memel or Dantzic is to be found; all the framing is of Swedish timber, and that of the most inferior quality. This is a matter, however, the tenant can put up with, if the doors and window-sashes shut tolerably close, and exclude wet and draught; but do we ever find them answer our expectations in these respects? And here, again, the inexperienced tenant is tricked by the old delusion. The doors are showily grained to imitate oak, satinwood, or maple, and their appearance beguiles the attention, but a little examination would in numerous instances show a "wind-ing" in the door, and that one's fingers might be placed between it and the rebate.

Nor is the jamb-lining or door-frame so truly fixed as it ought to be, defects which tell immensely against the arts of deception practised by the painter and grainer. The position of doors to the principal rooms is dictated by the whim of the builder; we frequently find the door placed so as to open exactly opposite the fireplace, without regard for those who may be seated back to the door in cold weather. The idea of the builder seems to be to give a symmetrical look to the principal room, which generally is the first to captivate the weaker sex in choosing a house. If the gilt pier-glass or over-mantel, with its *objets de luxe*, be seen from the door, it adds much to the "first impression" with certain people, whatever may be the discomfort after-experiences confirm during the colder months of the year. Then, of course, folding-doors is another of the weaknesses of "genteel" houses, and it may be necessary to caution the would-be tenant to see if the doors are so hung that one of them does not come in collision with the outer hall-door of either room. It is remarkable to find such a carelessness in planning; but we have really more than once found that sufficient wall room had not been left to clear both doors comfortably, the result of which is that a stranger or even an occupant occasionally gets a rather awkward knock when entering the room. A door close to the bottom of a staircase is a frequent cause of accident; nor must we omit the thoughtless plan of placing a door close to the corner of a room, the effect of which is that a useful surface of wall is lost for furniture, while anyone seated near the door may come to grief. We may caution intending householders to look carefully to the stoves, which are generally of a showy, trumpery kind, and the backs so thin that a few fires will eat them through; the smoke-doors are often badly pivoted, and are constantly getting out of order, and much will depend on the setting of the grate, for if badly done smoke will find its way through the crevices, and it will be next to impossible to enjoy a clean or comfortable hearth. The kitchen-range generally comes off the worst of all, and is of the cheapest and thinnest kind. The boiler is proverbially useless after a while, the tap leaks and the back and oven-plates wear through, so that the heat is lost, or burns the pastry. If a kitchen is fixed, the only safe way is to light a fire and test its capabilities. After stoves, attention may be directed to the flues and the manner they have been gathered in over the fire-opening; and if there is a heating-apparatus it is desirable to call in a practical engineer to examine its working. In one recent instance we know, a tenant discovered that all the water drawn from the upper cistern was warm; the pipes were examined, and it was found that they descended so close to the flow-pipe from the kitchen-boiler, that the heat was abstracted from the warm pipes, while the latter naturally lost heat, and both the hot and cold supply suffered. Attention ought to be mainly directed to the boiler, the position of the flow and return-pipes, the connection with the bath-cocks, and to see if proper valve-cocks, to regulate the heat, have been provided. These are unpleasant details to inspect; but upon them the comfort and habitability of a house depend. The cisterns and tanks equally demand the closest attention: that there should be one for the potable water in a place above the suspicion of being poisoned by gaseous emanations, and another for culinary use, hardly needs mention.

It is unnecessary to say how much of the comfort of a house depends on the fittings, and we might enter rather fully into this part of the subject if space permitted. Sash-fasteners and water-bars and bolts for casements are amongst the most vital to the comfort of a house; but the speculating

builder seems to think anything good enough. The sash-fastener bends or gives way with the strain, and does not draw the sashes closely together as good ones will do, while the door furniture throughout the house is cheap and of the vilest manufacture; the handles soon get loose and fall off, and the spindle never turns the latch properly. As for the smaller latches and turn-buttons, they are constantly breaking; and the tenant, if he takes a long lease, ought to guard himself against the imperfection of these things, and the expense of being called upon, at the termination of his holding, to make good deficiencies. We have referred, rather in detail, to these weaknesses of modern houses built to let, in the hope that, before long, the unwary tenant will find some protection, and, either by legislative interference, or by a combination of interests, the lessee will obtain some guarantee of the fitness of a house before he enters into a legal contract with his landlord to pay rent for a certain term, and to be subject to the shortcomings, and discomforts, and repairs of a dwelling, the brunt of which the tenant covenants to bear.

GASEOUS FUEL.

WE have so long been accustomed to regard coal-gas merely as an illuminant, that it requires some effort to familiarise ourselves with the opinion which is daily gaining ground, that gas, suitably prepared and consumed in furnaces and stoves of proper construction, is among the best and cheapest kinds of fuel. One of the foremost and ablest advocates of the employment of gaseous fuel is Dr. Siemens, whose name is justly honoured by all students of science as the inventor of the regenerative furnace, and the pioneer of the employment of electricity for illuminating purposes. Dr. Siemens has recently urged the preparation of two kinds of coal-gas which he proposes should be distributed in separate mains, and be each of them specially adapted for the particular use to which it is to be applied. The gas given off from the retorts at the beginning and end of the process of gas-manufacture is far less rich in illuminating qualities than the gas expelled during the other part of the distillation, and the Dr. has pointed out that by collecting the gases evolved at the commencement and close of the operation and separating them from the remainder of the gas, it would be easy to obtain from, say, one ton of coal, one-third of illuminating-gas of high quality, or about 3,520 cubic feet, and two-thirds heating-gas, 7,040 c. ft. In London and many of our large towns it would scarcely be necessary to provide any additional mains, as, owing to competing companies, or the extension of the supply, many of the streets already contain a duplicate set of pipes. But even if it became necessary to lay fresh mains, to make new house-connections, and to provide a second meter to each house, the advantages of the plan proposed by Dr. Siemens would, we think, repay the additional outlay required. The cost of the cheaper and less perfectly purified heating-gas might be kept as low, probably, as 1s. per 1,000 cubic feet, while the pure and high quality of the illuminating-gas might fairly enable it to be charged for at a rate of, say, 5s. per 1,000 ft. We need not, for the present argument, suppose that the heating-gas would be distributed without any attempt at purification, for it would certainly pay the gas company to take from it certain impurities which now constitute a considerable source of revenue, and amply repay the cost of their extraction. We have reproduced the stock arguments of gas-managers against the plan propounded by Dr. Siemens, in order to show that though at first sight it might appear that there are considerable difficulties in the

way of such a scheme, they are by no means insurmountable, and could readily be overcome if needs be. The main obstacle to any attempt at progress at the present time is the comparative insignificance of the demand for gas for any other purpose than that of lighting, and the strong position of the gas companies in the absence of any serious competition. We may assume that at the present time, each ton of coal carbouised yields about 10,500 cubic feet of coal-gas. This volume of gas, sold as at present for 3s. per thousand cubic feet, yields, say, 31s. 6d. to the company. They have no inducement to split up this gas, even if a brisk demand arose for cheap heating-gas, into, say, 3,500 cubic feet of 18-candle gas at 5s. per 1,000 feet, and 7,000 cubic feet of heating-gas at 1s., for they would obtain only 24s. 6d. for the same volume of gas. Even if we take the best possible case, and assume that the total yield is broken up into 7,000 feet of 16·25-candle gas at, say, 4s., = 28s.; and 3,500 feet of heating-gas at, say 1s. = 3s. 6d.; total, 31s. 6d., the company only gain the same price as at present, and they have to undertake a double distribution. From the experiments of M. Ellisen, of Paris, it would appear that the latter case represents the most favourable results to be obtained by splitting the gas into two qualities. When half the total volume of each kind of gas is obtained, the lighting-gas is of 16·78 candle-power. It is worthy of notice that even the very high qualities of gas do not actually contain more than 6½ per cent. of illuminating constituents. In ordinary gas, such as that supplied in London, in each 100 cubic feet there are only four which actually yield light; the remaining 96 cubic feet are chiefly heating-gases, which burn with a colourless flame. We do not wish to make out that the gas could be used without these heat-giving constituents; indeed, they have a most important office to perform in raising the temperature of the flame, in order to permit of the perfect combustion of the hydrocarbons. We only draw attention to this fact in order to show what a relatively large proportion the non-lightgiving gases bear to the illuminants—viz., about 24 to 1.

But when cooking and heating by gas and the employment of gaseous fuel for manufacturing purposes comes to be a little better understood, we very much doubt whether even the cheaper form of coal-gas, prepared as at present, and which we have assumed might be sold at 1s. per thousand cubic feet, will ever become the fuel of the future. Heating-gas of very good quality, and in every way well adapted for domestic and manufacturing purposes, can be obtained at an infinitely less cost, and with a far cheaper description of plant than the gas which is now distilled from coal in retorts. To this cheaper gas the term, "water-gas," has been somewhat improperly applied, and such gaseous fuel as this can be prepared on a large scale at little more than 2d. per thousand cubic feet, with a fair margin of profit. Concerning the manufacture of water-gas, we need say no more here than that there are numerous plans, all more or less efficacious, for decomposing water into its two gaseous elements, hydrogen and oxygen. By the best of the contrivances which are employed for this purpose, it becomes possible to effect the separation of these gases, and to cause the oxygen at the moment of its liberation to combine with a volume of carbon, producing the best form of gaseous fuel obtainable from coal—to wit, carbonic oxide gas. In the ingenious apparatus which has been patented for the manufacture of this gas by the Dowson Economic Gas Company, water contained in a small boiler is converted into steam, and this steam is superheated in iron tubes; a jet of the high-temperature

steam thus obtained is then passed into a furnace containing a deep layer of anthracite coal. The steam, acting on the principle of the injector, is made to carry with it an adequate supply of atmospheric air, and the red-hot coal at once decomposes it into its gaseous elements—a very copious evolution of gas suitable for heating purposes is thus effected—and the gas may be purified by passing it through a layer of spongy oxide of iron. The yield of gas is in the ratio of 1,000 cubic feet to each 12lb. of coal added to the furnace, and 180,000 cubic feet can be readily obtained from one ton of anthracite coal. This gas has a calorific power equal to about 'rd that of coal-gas, so that, in round numbers, we may assume that each ton of coal will yield, by this treatment, an amount of gaseous fuel equivalent to that obtained from five tons of coal carbonised on the present system. But gas made by the decomposition of steam has no tar, no ammonia, and cannot possibly burn with a smoky flame; indeed, there can be no deposition of soot, even when a cold metallic surface is exposed to the flame. Moreover, the foul-smelling hydrocarbons which cause the disagreeable smell in ordinary coal-gas, and which have led to many difficulties in using gas for cooking purposes, are entirely absent in the water-gas. It will be quite possible for a few families living in adjacent houses to combine and to obtain a supply of this economic gas laid on to their houses in the same way as coal-gas now is, and this new gas can then be employed in the kitchen, the laundry, the bath-room, and the conservatory, and the present use of coal as a fuel may be entirely abandoned. We are informed, indeed, that Lord Sidsely has adopted the gas for all these purposes with complete success. We have still to mention that another important feature connected with this gas is the facility with which it may be carburetted or impregnated with illuminating constituents. This is effected by passing it through a vessel charged with gasoline. The vapour of the gasoline is absorbed by the gas, which becomes thereby so much enriched as to yield a high standard illuminant, superior in fact to London gas. We should remember, in conclusion, the immense importance which the possession of such a gas implies when we require power for domestic or manufacturing purposes. In a gas-engine of the "Otto" type, made by the Messrs. Crossley, this water-gas can be used in the same way as coal-gas now is, and the cost of each horse-power is proportionately decreased. The actual cost of working, on an extended trial, with a 3½ horse-power effective engine, has proved that one horse-power (indicated) per hour is obtained with a consumption of gas derived from 14lb. of anthracite coal. When we contrast this result with the working of the largest and best steam-engines, using 2lb. of steam-coal per horse-power per hour, the gas-engine has a large balance in its favour; but when we remember that with small steam-engines the common consumption of coal varies from 5lb. to 6lb. of coal per horse-power per hour, the advantage in favour of the gas-engine and the new gas is too great to be long overlooked by those to whom cheap power is a desideratum.

TIMBER AND ITS CONVERSION.

IN specifications for new buildings, under the head of "Carpenter," the general clause introduced in most instances, describes the timber to be of the "best Memel, Riga, or Dantzic;" but it must not be supposed that this phrase is literally interpreted by the builder. His interpretation is that any good timber, fit for the purpose, may be used. Technical and reliable information

on timber is not generally one of the branches of his profession with which the architect is best acquainted, and we have heard of instances of mistakes of rather ludicrous kinds. Memel is so like Dantzic that few can distinguish them, and after all, for practical purposes, no great harm would arise by the use of one kind for the other. It is as well to know, however, that Dantzic is the stronger timber of the two, and the balks will generally hold 14in. to 15in. square. Riga is not generally considered so good as the last, but it is more reliable and practically useful than the other kinds, as its grain is straight, and it is free from large knots—two points which, in spite of its cost, are much in its favour with the builder. Its size runs about 13in. Laxton says of it, though "dearest in the market, it is cheapest in the end." We should like to know how much Swedish timber passes for that described as Memel, Riga, or Dantzic. Many builders swear by Swedish timber, and when well selected there are few, even experienced architects, probably who would detect it from Memel. It is pretty well known, also, that "second quality" of Memel and "Middling" Dantzic do most of the London work of the best description. Swedish timber has also improved of late, and for small scantlings and weights it is as well suited as the other kinds of timber. Yet Mr. Laslett says Swedish fir has little to recommend it beyond the fact of its being cheap and suitable for the coarser purposes of carpentry. The balks are generally about 10in. to 12in. square, and are tapering in form. The best Baltic deal comes from Gefle and Soderham, and the best only ought to be used. Again, as regards seasoning, there is a good deal of misunderstanding. As the timber is bought in the water, it is always wet, and it is of little use to specify that whole timber is to be well seasoned. The only precaution that the architect can take is that shrinkage of partitions and other heavy portions be reduced as much as possible by the use of iron and the mode of framing. Of red pine little need be said more than it is durable and tough, has little sap, often resembles Memel and may be used with safety anywhere.

It is desirable for the architect to be able to specify the kind of timber best suited for the particular purpose, and by thus discriminating he earns the respect of the practical builder, and his specification is more likely to be followed than if he described all timber to be of the best quality Northern pine. Thus Memel of the "third" quality is good enough for heavy girders and timbers of warehouses; but for light scantlings "die square" timber is the best. Thus for ceiling joists the timber which comes over 1in. to 5in. square is as good as balk-cut timber, and is better seasoned. Such scantlings are about half the price of full-sized timber, and as the sawing is saved the builder gets an advantage. It is necessary to know, too, that timber in planks, deals, and battens, is a more convenient form for ordinary building purposes than larger timber. The price per standard at which they can be procured is much less, and sawing is saved. For large joists, girders, and binders, especially those which have to carry heavy weights, whole timber ought to be specified, as these smaller descriptions are cut out of young timber, and they are not so close-grained and strong as that cut from the log.

In specifying deals, it is usual to name best Christiania or Petersburg. When cut from the pine they are called "yellow or red deal," while the spruce produces the "white deal." As in the case of timber, the above description is liberally interpreted, and any suitable deals free from knots are used. As all our readers know, the usual

sizes are, for battens, 6in. by 2½in. to 7½in. by 3in.; for deals, 9in. by 3in.; and for planks, 11in. by 2in. One practical authority says deal used 3in. thick ought to be three years old before using; but if cut into inch stuff, it dries in about six months after cutting. In fact, the thinner the stuff the less time it takes to dry the wood through. It is superfluous to inform the practical reader that a free circulation of air is required in drying timber. The wood should be stacked so as to allow spaces between the deals, and it is found that wood dries faster when stacked on end than when laid flat. Of the Swedish deals, the Gottenburg are very reliable; they are distinguished for a small black knot—a "pin-knot," as it is sometimes called. The Finland white and yellow deals are also recommended, and they are straight and readily convertible. The Petersburg, Onega, and Archangel deals are, however, the best, and generally free from sap, shakes, and loose knots, clean in grain, and have a good wearing-surface; but there are inferior qualities, which are often worse than the better kinds of inferior goods. Newland, in his "Carpenter and Joiner's Assistant," says:—"In those from Archangel and Onega the knots are often surrounded by dead bark, and drop out when the timber is worked." Swedish deals are largely used for floors, and answer well. It is only the experienced architect who knows that there is after all very little in names and the mere terminology of specifications, and with respect to timber he exercises his own judgment. What is meant by "best timber" is that generally understood by the timber merchant—namely, straight-grained timber, free from knots and other defects. To give general rules for selecting timber is to mislead the young architect; to tell him to choose that which is the brightest in colour, in which the red grain appears prominent, and to avoid spongy hearts and porous grain, is to give him no distinct knowledge, as such terms can only have a relative meaning, and may after all tend to mislead. There are few parts of the building trade which perplex the younger members of the profession who have not had the advantage of workshop training, more than the technicalities of timber and its working, and no doubt a great deal of the aversion in which it is held is due to the number of dry rules which beset the trade of the carpenter and joiner. There are numerous treatises which give the theory and principal rules, but a great deal has to be gathered from actual contact with materials, workmen, and their machines. Let us, for instance, consider for a moment the immense strides made in timber conversion by the use of steam machinery. One of the most important things to learn, is how to convert timber to the best advantage. Let us take, for instance, those commodifiable sizes, battens, deals, and planks. There are certain ways of cutting these up to prevent waste, and it is just the neglect of this which leads young architects into error in details. It is well known that a lin. board when finished is not exactly that thickness, but is got out of stuff of an inch thick, and that with bad sawing and planing the deduction is generally quite an ½in. Some architects specify so as to cover this, though the clause is not often respected. It is seldom that two ½in. thicknesses of board can be got out of a 3in. deal without considerable waste, and, no doubt careless sawing at the bench by the revolving-saw has much to do with it. Many, on this account, have preferred the old-fashioned frame sawing as being truer. Perhaps in this particular operation the steam machinery has not been so decided a gain as it has in other operations, such as grooving, mortising and tenoning, moulding, &c. Again, in framed work, such as doors, the stiles and rails may be all got out of deals, and much

saving in pricing might be made without necessarily compromising architectural character, if architects would remember how best to economise the smaller descriptions of timber, or to cut a batten or deal without leaving a piece of stuff which is too thin to be of any use to the contractor.

THE BRITISH ARCHEOLOGICAL ASSOCIATION AT MALVERN.

[FROM OUR OWN REPORTER.]

THE Malvern summer meeting of the British Archaeological Association has been one of considerable and varied interest, as our report will indicate, and, in regard to the numbers attending it, may undoubtedly be reckoned amongst the most successful ever held. The area visited has been more closely circumscribed than usual, owing partly perhaps to the obstacles to locomotion presented by the great chain of hills lying to the west of the meeting-place, and partly to the fact that carriages were used in preference to the railways more largely than has been customary in these excursions—a choice which the unpropitious weather rendered somewhat unfortunate.

The feature of the meeting has been the diversity of objects seen. Numerous earthworks upon the hill-tops were examined, and caused warm discussion—as a matter of course not resulting in uniform agreement. Only one mediæval castle, and that (Branshill) a mere fragment of outer tower, was seen. Of the many churches examined a large number were cruciform in plan, with central towers, and retained in their low arcades, carried on cylindrical columns with plain heads, and in their deeply-splayed windows, extensive remains of work executed at the Transition period, when the highly-elaborated Norman was merging into the simpler, more refined, and less massive Early English style.

Perhaps the next interesting of these Early churches was that at Kempey, near Ledbury, which the exigencies of space compelled us to notice but briefly last week. It is a small building, entirely of the 12th century, and the internal walling is covered with elaborate contemporaneous frescoes, which were discovered in 1871 by Mr. Middleton, and are fully described in Vol. XLVI. of the "Archæologia." Those upon the walls and barrel-vault of chancel represent the Saviour in Glory, the Twelve Disciples, and various scenes from the Apocalyptic Visions, and are by far the most complete frescoes of their date in England, the nearest approach to them being the well-known ones in the apse of Copford Church, near Colchester. Unfortunately, Kempey Church is almost disused in favour of a modern and more commodious one, and not only has it not been restored since 1670—except in the careful cleansing of these mural decorations—but every side of the tower is scored with cracks and bulges from the perpendicular, in a manner suggesting apprehensions of a disaster to these unique examples of Transitional Norman frescoes, and possibly to human life. On the same day two examples of the massive detached church towers of Herefordshire were seen at Bosbury and Ledbury, and a third was described at an evening meeting in a paper by its restorer. Many beautiful illustrations of Early English and Decorated work were seen, the latter being rich in reticulated fenestration in the southern portion of the district visited; but the comparative rarity of the Perpendicular work was noteworthy, Kidderminster and Prestbury churches, the exterior of Great Malvern priory, and a few inserted windows and doors being the principal examples.

The Benedictine churches at Worcester, Tewkesbury, and Great and Little Malvern, furnished abundant material for study, and the stained glass of the 14th and 15th centuries in the two last-mentioned priory churches received the attentive study it merited. The few lettered and figured tiles still scantily sprinkled over many of the chancel-floors in the district—and in one or two cases, as at Great Malvern, used as reredoses, or as wall decorations—are a local peculiarity which attracted notice. Jacobean fittings were found in a few churches. Bearing in mind the extent to which church restoration has progressed during the past twenty years, it was curious to find so many churches still unrestored

since the days of whitewash, galleries, and high pewing, these including, among others, Kempey, just referred to, the extreme instance at Huddington, those of Areley King's, Bishop's Cleeve, and St. Andrew's, Droitwich.

The Malvern Congress will, perhaps, be longest remembered for the examples of domestic architecture seen during the nine days it has lasted. Many of the typical Worcestershire houses of the 15th and 16th centuries were visited. Two of these, Huddington and Birt's Morton Courts, still retain their original moats, and many are constructed of half-timbered quartering, filled in with plaster or brick nogging, the whole of the façades being painted in glaring relief with black and white—this colouring being, in several instances, extended, with a foolish disregard to honesty of construction, over later additions in brickwork. Sometimes the bargeboards were ornamentally treated, and in many cases the old internal subdivision into hall, with dais and minstrel's gallery, and wide staircase leading to the low upper rooms, could be traced, richly-carved oak chimney-pieces, the oak panelling, and the ornamental plastered ceilings of the Jacobean period being more common, and frequently coexistent with the hall arrangement.

The evening meetings were well-attended, and the papers read were chiefly historical or antiquarian in character, only two or three dealing with architectural subjects. The thoughtful inaugural address of Lord Alwyne Compton, is referred to elsewhere.

The benefits derived from congresses like that just concluded, are by no means restricted to those who take active part in them, although the latter must learn much by the comparison of many examples of ancient workmanship, and indubitably gain mental advantages in the vividness with which the life and history of the past are brought before their eyes. The chief utility of these archaeological excursions is the "gude conceit of themselves," imparted to the possessors and custodians of antiquities, by observing the interest their treasures excite in others, and the increased regard and value thereby aroused in their own minds. Of this reflex benefit, no better example could be needed than the singular rediscovery of forgotten municipal charters at Kidderminster on the eve of last week's visit. Mr. De Gray Birch's observations at Worcester Guildhall, as to the best means of preserving fragile and irreplaceable documents have weight, both from the speaker's official position and their simple and practical character. The delight with which scattered fragments of stained glass in the heads of tracery, figured tiles bestrewn over a passage through a church, or carved woodwork in a cottage or farmhouse are viewed, and the zeal with which they are noted and sketched, must result in these relics being more carefully cherished, while often a prophetic intimation that if a plaster ceiling were pierced, an open-timbered roof would be exposed, or if a wall were cleansed from whitewash, a fresco would be revealed, has led to discoveries in themselves pleasant additions to our knowledge, and of greater consequence in the new trains of thought awakened in the minds of those so set to work. In many a church and timbered house, a few suggestive remarks as to the desirability of resetting a few stones here, of carrying out a little drainage or ventilation there, or of pointing a chimney or gable yonder, have given hints for the preservation of ancient buildings, productive of great good. Each year such societies as this open up a new district, and so lead to a widened interest in their aims and objects.

But it is time we left these generalisations on the work and results of this and kindred archaeological and architectural excursions, and resumed our detailed narrative of the proceedings at Malvern.

To complete the story, we must revert to the proceedings of

THURSDAY.

Owing to the persistent rain, a very late start was made, and the programme was somewhat curtailed. A series of old houses lying south-east of Malvern, and close to the Severn, were visited, the first halt being at

BIRT'S MORTON.

The Church did not detain the members long. It has been enlarged and restored, from the plans of Mr. T. D. Barry, of Liverpool, and the carving of foliage responds to chancel and transepts, executed by a local man, Mr. Hill, of

Ledbury, were highly spoken of for freedom of treatment. The old "sanctuary ring" and hinges have been refixed on mod in south door; and in the church, the earlier portion of which is Decorated, are a plain circular Norman font, a fine altar-tomb, presumably to Sir John Nanfan, body-guard to Henry VI., having small carved figures upon it, representing members of his family, which has judiciously been left unrestored; a monument on chancel wall to Admiral William Caldwell, d. 1717, who is depicted in flowing wig and dress of the period, and an alms-box, tempo Edward VI., formerly attached to the churchwardens' pew; it is carved out of a log of wood, is adorned with incised ornament, and has three locks. *Birt's Morton Court*, close by, now a farmhouse, as seen in the rain, was the ideal of the dreary "moated grange"—a group of buildings in stone and brick, surrounded by a moat completely coated with duckweed, and approached from a muddy farmyard by a stone bridge. This bridge is faced by a 14th-century stone gateway, having a more modern brick battlement, and beyond an inner courtyard is the house, a low timber and stone structure, now inhabited by a farmer. The chief room has oak-pannelled walls and a massive fireplace, all well carved and enriched with shields of arms; above is an elaborate beamed and plastered ceiling in hexagonal panels. In this room, the Rev. W. S. Symonds, F.G.S., read a paper, in which he said that this village of Birt's Morton, standing in the Woodlands of Malvern Chase, was one of those mentioned in Domesday. The family Birts or De Brutes lived here in the reign of Edward I., and at a still earlier period tradition asserted that Owen Glendower, who married one of the daughters of Birt, used to visit the family (disguised as a shepherd), and a so-called secret chamber formed in the thickness of the wall, at the back of the house and looking into the moat, still existed, now used as a cupboard. Sir John Oldcastle, also connected with the Birts, was concealed here. The house afterwards came by marriage to the Nanfane, a Cornish family, who lived here in the 15th, 16th, and 17th centuries, and the statesman, the Right Hon. William Huskisson, was born in the house, his father being then a farmer and churchwarden of the parish. This room contained a great number of shields bearing the arms and quarterings of the families with whom the Nanfane married. Mr. Loftus Brock pronounced the present house, although occupying an ancient site, to date no further back than the time of Sir John Nanfan, of Henry VI.'s household: the beautiful pannelled ceiling was Elizabethan, and more recent than the beams which crossed it; and since it was cut away at the edges to admit the oak cornice, it was evident that the waiters were more recent, and indeed, was somewhat later than the Jacobean mantelpiece. Very similar carving, dated 1634, was seen the previous day in a house in Church-lane, Ledbury. Mr. Symonds and others urged that the arms must have been gradually carved as new alliances took place; but Mr. Brock held that, as at the present day, the whole series were done to order at one time about two centuries ago. The evidence of relative dates of walling and ceiling, fixed by the cutting away of the latter, appeared on examination indisputable. Upstairs the beams of what was once the hall, and some more ancestral bearings were seen, and in an upper room of an outer building next to the entrance gateway, now used as a cheese-room, a plastered ceiling divided into hexagonal and other panels containing fleur-de-lis was seen.

Payne's Place, *De Key*, the next house seen, is smaller and more modern, and has no moat; it is also occupied by a tenant farmer, and has been thoroughly restored by the owner, Mr. W. Dowdeswell. It is built of timber and red brick, and has at the back a highly ornamented bargeboard, one side of which, however, is a reproduction. The Rev. J. M. Guiling, of Busbley, explained that this house was built in 1450 by Martin Payne, a merchant in the neighbouring town of Tewkesbury; its chief interest was that after the battle of Tewkesbury, fought in 1471, soon after it was finished, Queen Margaret of Anjou, finding that her husband's cause was hopeless, prevailed on two monks to row her in a boat across the Severn, and to seek shelter here for three days. She then set out for Worcester, but was captured on the way. Canon Winnington Ingram asked what grounds

there were for this statement; to which Mr. Guilding replied, Tradition had always associated the room on first floor with the Queen, and the position agreed exactly with the historical narrative—on the opposite side of the Severn to the battlefield, and not two miles' distance from it. Canon Ingram replied that Margaret was said to have lived in a religious house—had this been identified with any establishment? It was replied it had not, but there was no monastery in the neighbourhood. Mr. Guilding also showed the parish register, brought from the (rebuilt) parish-church of Bushley, which dates from 1538, and contains the entry of the burial in 1516 of Edward Tyndall, brother of William, the martyred translator of the Bible. The lower room contains some good panelling, and high on the walls some didactic distiches, written by Margaret Stretton in the 16th century. On the upper floor was seen the modernised Queen's room, looking upon Tewkesbury Abbey, the Severn, and the battlefield, and in another bedroom and in a passage the high-pitched beams of the former hall, and part of the front of minstrel's gallery.

After luncheon in Moss House, Poll's-park, a modern picknick kiosque belonging to Mr. Dowdeswell, the carriages were resumed through Epton and Hanley, to *Severn End*, of which, on the 19th ult., we gave a view and description (p. 215). In the principal apartment, the dining-room, the Rev. T. W. Wood, vicar of Eldersfield, on behalf of Sir Edmund Lechmere, M.P., welcomed the members, and read an historical paper on the house, which he said occupied a spot that had, with one interval of 10 years, been the residence of the Lechmères from the time of their arrival from Brittany or Holland with the Conqueror. The name is only a century or so old, it having formerly been known as Hanley and Lechmere's place. The house, as they saw it, was built by Nicholas Lechmere, a judge of Charles II.'s time, from whose diary we could trace the whole progress of the work. Nicholas was the third son and the heir of Edmund Lechmere and Margaret, the daughter of Sir Thos. Overbury. He was born in 1613, and in 1611 began the alterations and additions which transformed the house, erecting on south or riverward side new rooms, and then garden-walls. In 1656, he planted an avenue of elms at the back, and in 1671 built a study at the south-west corner of the garden, which was restored by Sir E. Lechmere in 1861. In 1673, he contracted with John Avenon to build him north and south projecting wings to the house, for £250, making an entry in the diary, "How this shall be performed time will show," a misgiving afterwards confirmed by the added note, "He failed in all things." In April, 1701, Judge Lechmere died, aged 88, but his descendants continued at Severn End till early in the present century, when the head of family sold the property, which was repurchased in 1855 by the father of the present Sir E. Lechmere. It was now furnished as a museum, and inhabited by the steward. The members then went over the house, examining the specimens of armour, china, and Etruscan ware, minerals, autographs, &c., with which it is furnished, and also the small but valuable library. The rooms have highly ornamental ceilings, but are very low; the main staircase has a disproportionately large newel and very narrow treads. It was remarked that the floors are of bees-waxed and polished elm, cut from very wide planks, the average being over a foot.

At the evening meeting at Malvern College, papers were read by Mr. C. H. Compton, on "The Antiquity of the Game of Golf," and by the Rev. W. S. Lach Szymra, on "Some Records of a Cornish Borough,"—those of Marazion or Market Jew, in which the author urged the desirability of having those interesting historical documents examined, edited, and published.

FRIDAY

was spent in a group of places near Kidderminster, being arranged and personally conducted by Mr. John Brinton, M.P., to whom the suggestion of Malvern as a meeting-place for the Association was due. The members arrived at

KIDDERMINSTER

by special train about 10 a.m., and were received in the new town-hall built in 1876, from the designs of Mr. J. T. Meredith, in a Renaissance style by Mr. Brinton, who introduced them to

the Mayor (Mr. Willis) in full robes, and the members of the Corporation. Upon the table were displayed a number of municipal documents, and the Mayor, in welcoming the visitors, mentioned that till the previous day, no one in Kidderminster knew whether any old manuscripts existed other than a charter granted by Charles II., and some very modern ones; but the night before, the assistant town-clerk, in searching through some old papers in preparation for the congress, found a paper parcel which, when opened, proved to contain a number of valuable documents now laid before them. He feared time would not permit of detailed examination that day; but after the congress the Mayor's parlour would be at the service of any members of the association, if they would examine and report on the discovery. Mr. Brinton, M.P., referred to this fortuitous coincidence as a tangible proof of the benefits accruing to towns through the visits of archaeological societies by inducing the inhabitants to search for and treasure their links with past history. He then read an historical paper descriptive of the borough. Anciently known as Chideminstre, the earliest mention of the town was in the 8th century, when Cunibert received a parcel of land of the name from Etheldred, King of the West Angles, for a monastery, an establishment utterly demolished by the Danes a century later, and of which no traces remained. In 1164 the church was given by Manser de Bissett for the founding of a hospital for female lepers at Maiden Bradley, Wilts, and so continued till the Dissolution, in 1538. The manor was at the Conquest the property of the King, but was granted by Henry II. to the above-named Manser de Bissett, and it successively passed through the hands of the Beauchamps, Nevilles of Bergavenny, Blounts, Waller, the poet, the Foleys, to the family of Ward and Dudley. The manor-house, near the parish-church, was sold by the poet Waller, its possessor and occupant, to escape from difficulties with the Parliament, and was at the present moment unroofed, and about to be removed for the extension of the church schools. There was near the town a sandstone tower of Caldwell Castle, erected about the time of Edward III., and attached to it a residence rebuilt about the beginning of the 18th century. There was also a mount, which, together with the castle, played an important part in the last Civil War, although it was uncertain whether the mount was erected in connection with or to command the castle. The manufactures of the town dated back to the 13th century, and woollen goods and serge were made from that time till the 18th century. In the year 1710 the manufacture of carpets was surreptitiously brought here from Wilton, where it had been imported from Flanders, and it had since become the staple trade, and supported an increasing population. Mr. Loftus Brock said that on the table were three old charters, having fine seals, much injured by rough usage, granted by Henry VIII. in 1530, Elizabeth, and Charles I.—the first reciting previous charters of Henry VI., Henry II., and Richard II., not now known to exist, the latter incorporating the borough. Mr. C. H. Compton said another of the documents was a probate of will dated 1651, headed Oliver Cromwell, Protector, in lieu of the then bishop of the Diocese of Worcester. In reply to a question from Sir J. A. Picton, as to whether the establishment of the carpet trade was not prior to 1713, the town clerk of Much Wenlock said, that corporation possessed a deed dated 1687, being a formal transfer from the outgoing to the incoming high bailiff of a "carpet from Kidderminster for the council chamber," as the first of numerous items. The Mayor also exhibited a copy of Richard Baxter's "Saint's Everlasting Rest," dated 1651, containing the autograph presentation from the author to the high bailiff and burgesses; a silver-gilt loving-cup of late Elizabethan date, with an inscription, showing it to have been enlarged in 1623, and two Roman querns, found in 1879 in Church-street.

The members then perambulated the town, apparently a thriving, and public-spirited borough, seeing the statues to Richard Baxter in the Bull-ring, and to Sir Rowland Hill, opposite the Corn Exchange, the one unveiled in 1875, the other a few weeks since; both are by Mr. Brock, who is a native of Worcester; they are executed in white statuary marble, and are heroic in scale. Baxter's House, now

a confectioner's shop, has no intrinsic interest; but also in Coventry-street, beneath an inn, is a large concrete vaulted crypt, apparently Mediaeval in character, which has been traced for 35 yards, and is, as usual elsewhere, said to extend to the church, about half a mile off, although no vestige of it or of an entrance is known to exist there. In the vestry of a Unitarian chapel, the pulpit formerly in St. Mary's Church, and used by Richard Baxter till the passing of the Uniformity Act, was seen. It is of oak, has a huge sounding-board, and is carved with stiff roses, pomegranates, and foliage, agreeing well with the date over the crown at head, "1623." On the edge of sounding-board is a quotation from Psalms, and on the panels is carved "The gift of Alice Dawkx, widow." In 1875, at the "restoration" of the parish-church, this interesting memorial was sold, with a quantity of pewing, for £5, to a townsman, who presented it to the chapel trustees.

The Parish Church of St. Mary and All Saints was next visited. It is chiefly of the 14th and 15th centuries, and has been refaced externally with the exception of the tower at S.W. angle, which is of crumbling red sandstone; the panelled battlements of clerestories have been coated during some restoration with cement. Projecting from the east-end, and connected with it by a vestry, is a large Perpendicular chantry chapel, founded by Simon Ryse, and till recently used as the grammar-school. In this room the vicar, Canon Boyle, read a paper, in which he stated that there was a church built on this site before 1100 by John Niger, but no traces of it were known to exist, except, perhaps, the concrete core of the tower. The oldest visible part of the church was the north side of chancel, in Middle Pointed style, next to it the tower, and then the nave, which was in the Third Pointed style. It was repewed under Johnson, of Worcester, in 1785, and restored in 1847, and again in 1872 and 1877. In this chantry the vicar showed a carved chair of Jacobean character, said to have belonged to Richard Baxter, having cut upon the back the names of Baxter and two of his friends. Some doubt was thrown upon its authenticity, not lessened when it transpired that the relic was recently picked up in a London dealer's shop. The members then went into the church, seeing on the way the oolitic shaft of the old cross, the head of which was destroyed during a riot in Baxter's time. On the north side of the chancel were shown the dents traditionally said to have been caused by cannon during the last Civil Wars. Some amusement was occasioned by the Mayor's exclaiming that this must be a mistake, as he helped to make the holes himself when a lad, by throwing leaden weavers' balls against the church. The arcades, columns, clerestories, windows were all seen to be in the Perpendicular style, well developed. There is a large stained-glass west window, by O'Connor, and a new reredos, containing a representation of the Last Supper, designed by Mr. W. Jeffrey Hopkins, Worcester, and executed by Messrs. Boulton, Cheltenham. On the north pier, behind where Baxter's pulpit stood, has been recently found an appropriate quotation, in Old English characters, from Corinthians, and supposed to have been written for Dr. Baxter; but Mr. R. Danks, of Worcester, remarked that the passage was not cited from the authorised version, and was, therefore, probably earlier than 1611. The church contains several alabaster effigies and brasses, including amongst the former Lady Beauchamp, c. 1469, represented as lying in ruff and mantle under canopied recess; and several of similar character but a century later, to members of the Blount family, three of these lying in an out-of-the-way corner at the south-west angle of building. In centre of chancel is an unusually large and well-wrought brass to Maude Saint Pierre and her successive husbands, Sir Walter Cooksley and Sir John Philip. Colonel Bramble, of Bristol, in describing this memorial, mentioned that the costumes depicted were of very early 15th century, both the husbands wearing plate armour and the collar of SS., the Lancastrian badge, the armour, as shown especially by the elbow-pieces, was of two types, the second husband being the later. In a recess opposite, on north wall of chancel, were recumbent effigies of a knight and his wife, both in very similar attire to those just examined, but indicating a still later type of armour by 60 or 70 years in the addition of taitles to skirt of

taces. Mr. E. Piper called Col. Bramble's attention to the fact that both brass and alabaster were believed, from inscriptions, to represent a lady and her second husband; did the change in costume indicate that some mistake in identification had occurred? Col. Bramble replied, No; it illustrated the important principle in deciphering monuments, or, indeed, paintings or pictorial representations of any kind, that a mediæval artist did not attempt to depict his subject, whether a person or building, in the garb actually worn, but in that which was in fashion when he executed his commission. Having again shown the differences between the costumes of brass and monument, he suggested that the order for the latter was given some time after the brass had been laid down, and, of course, in any case to a different artist.

The members then drove to *Warshall Camp*, an entrenched space, on the summit of a hill in the Forest of Wyre, cut through by a roadway, and commanding a splendid view bounded by the Wrekin, the Hagley and Lickey Hills, the Cotswolds and Malverns, and the Radnor Brecon, and Shropshire Hills. Here Mr. Brinton read a short paper, in which he stated that the trenches and ditches which still crowned the hill formed one of a series of strong earthworks (many of which were pointed out) defending the Saxon borderland against the Cymri or Welsh, whose great camp was at Maybury hill, well in sight to the south. This fort was second to none in position, being placed so as to command the valleys of the Severn, Teme, and Stour. Passing through Wribbenhall and over Telford's Bridge to Bawdley, where were seen several half-timbered houses, and a large and plain brick church of about the time of George II., the party went to

RIBBESFORD CHURCH,

Which, although partially rebuilt two years since from the designs of Mr. Preedy, of London, afforded an agreeable surprise. It is much too large for present requirements of the little village, but is mother-church of Bewdley; it is chiefly of the fourteenth century, but the south and west doorways are Early Norman, and fragments adorned with chevron carving are worked into the south wall. The south aisle is separated from nave by massive oaken pillars and struts of the fourteenth century, while that to north has curious stone piers nearly a century later in style, evidencing an intention to rebuild in stone. The roodloft stairs and doorway (partly concealed by a new memorial-brass) are not opposite but between two pillars, and are in the south aisle wall. The lectern is completely covered with flat Jacobean ornament, and seems contemporary with south porch, which is dated 1633. The rude Norman sculpture in south doorway revived an old controversy as to its subject. It represents a man shooting with bow and arrow a four-footed creature of prodigious girth, and having spines on the back and a flat tail, while between runs a slender quadruped. This, Mr. Brinton said, had been described as an archer shooting a salmon and deer; but Mr. E. Lees, of Worcester, said he regarded the "salmon" as a seal and the deer as a greyhound, and others took the former to be a beaver or otter or dragon. The general opinion was that it was a symbolical representation of Pursued Man delivered from the strong one by a Stronger. Mr. Brinton, Mr. Brock, and others having described the church, the Early Jacobean *Ribbesford House* was seen directly afterwards. It is of stone, with octagonal turrets at entrance, covered with ogee cupolas, and is surrounded by a moat. It was formerly the residence of the Herberts of Cherbury.

ARELEY KING'S CHURCH.

is an unrestored structure having flat plaster ceilings, open pews, and unsightly west gallery. On the north side is a walled-up Norman doorway, of two periods of carving. The rector, the Rev. J. P. H. Hastings, showed in the chancel some singular epitaphs, including one on a flat stone to one Walter Walsh, dated 1702, who was "ruined by three quackers, two lawyers and a fanatic to help them," and in the churchyard a still more curious one. It consists of huge new red sandstone boulders forming the boundary-wall overhanging a cliff, and inscribed in letters a foot high with the trilingual jumble, "Lithologema quare? Reponitur Sir Harry." Till recently, the rector said, this was a puzzle; but the recent discovery and recovery of the ancient parish registers from a Tewkesbury

solicitor's had shown that the old tradition was correct, that they marked the burial-place of the eccentric "Sur Harry Consby," or Coningsby, of Hampton Court, Herefordshire, who "was buried in wollin at midnight," in Nov., 1701, near the wall he had caused to be raised. Mr. Brock pointed out that some elm-trees beyond the walls were breaking the inscribed stones of many tons weight, and would ultimately overturn them, but the rector said he would not have the trees cut down in his day. In the churchyard is also an immense hollow yew-tree, and a pillar sun-dial, dated 1687. The *Hermitage Caves*, near the Stour, are deep recesses in the sandstone cliffs, and vary from 10 to 20ft. high. They were probably formed by quarrying, and have been used at several periods, and again a few years since by persons of dubious antecedents. At

MOOR HALL, STOURPORT,

the members were entertained by Mr. Brinton, and in the after-dinner proceedings Sir James Picton referred to the re-discovery of the Kidderminster corporate records as the event of the congress, and said that in the examination of municipal documents, a new field of archaeological research was just being opened up, which would hereafter probably throw new light on our towns' inner life and history. A good example had been set in the publication of extracts from these manuscripts by Oxford city, which he trusted would soon be followed by Liverpool, and that other boroughs would endeavour to popularise the history buried in these muniments. The members then went over Mr. Brinton's residence, which is especially rich in landscapes in oil and water-colours by modern English painters, including B. Williams Leader, Nasmyth, T. Webster, H. Dawson, sen., and G. B. O'Neill, and a number of Tyrolean views by Vöschner.

At the evening meeting, Mr. T. Morgan, E.S.A., read a paper upon "Some Flowers of Chivalry and Fields of Rue, 1458-71 and 1642-57." Mr. E. H. Lingen Barker followed with one upon "Garway Church, Herefordshire," recently restored under the author's direction, and illustrated from his drawings in the *Building News* for May 13 of present year. The church had, he said, two peculiarities—a detached tower connected with the main fabric by a long, covered passage, and a fine chancel arch which had been thought by some to be Saracenic in its details. Mr. Loftus Brock said the drawings showed an ordinary Norman arch, with no suggestions of Oriental influence. Sir J. A. Picton said it was probably that the tower was erected as a defence against the Welsh, and that the church was a later addition. The Rev. J. R. Burton, F.G.S., read a third paper containing extracts from the parish registers of Ribbesford, visited on Thursday, and from the chapel and bridgewardens' accounts of Bewdley.

SATURDAY.

This was a carriage-day, allotted for the examination of early earthworks, a priory and church, and a modern and an old castle, lying a few miles south-west of Malvern.

LITTLE MALVERN PRIORY,

Now the parish-church of St. Giles and St. Mary is a fragment of a Benedictine monastery-church, consisting of central tower and chancel. The tower is Perpendicular, of four stages, abruptly capped by a modern high-pitched roof. Attached to the west face are responds and caps of Transitional Norman columns, with hollow chamferings (c. 1180), and to the south of these Mr. Loftus Brock pointed out still earlier work (evidently that of the original foundation) in plain-chamfered caps of former aisle. Beyond south side of chancel are ivy-clad piers and arches of a former aisle, and on the north Mr. J. Tom Burgess showed that a broken flagstone has on it moss-covered incised crosses in centre and on front edge, where is also some Roman lettering, clearly proving this neglected fragment to be a former altar-slab, probably of south chapel. Inside, the remarkable features are the remains of Late 15th-century stained-glass in east window, the Perpendicular rood-screen and beam now dividing the quasi-chancel from nave, an open-oak structure crowned by pierced quatrefoil-stage, and solid, slightly-overhanging cornice, the latter convex and carved with flowing-vine ornament, and a roll-member filled with roses; and the patterned tiles

in floor. The fenestration is at first sight a puzzle, as within Debased Tudor arches in side walls, are a lancet and Flowing Decorated windows, while above are 15th-century double clerestories—anomalies explained by the theory that Bishop Alcock, in the rebuilding, reset old lights in his new arches, which agree pretty nearly in style with his chapel at east end of south aisle, in Ely Cathedral. The octagonal base of a column, from the nave, is refixed in present church, to serve as a font, and there are two walled-up hagioscopes, formerly looking into chancel aisles. The carved misericords of the stall-seats have been hacked off. Mr. Daniel Parsons read a scholarly paper in the little church, which he said, like the others in the grand group of Great Malvern, Evesham, Pershore, Gloucester, Tewkesbury, and Worcester, was originally that of a Benedictine establishment, and was founded in 1125 on a site described by Buck in the last century as "a dismal cavity between the Malvern Hills," and the original grant was signed by Simon, twenty-seventh Bishop of Worcester. It seemed to have been rebuilt in 1171-87 by Joscelin and Edred, and again greatly altered in the Decorated period, to which, and to the Early Perpendicular, the present remains belonged. In 1480, Bishop Alcock, of Worcester, found the discipline very lax, and dismissed the four monks, and, after closing the priory for two years, and rebuilding the church, he reopened the establishment. It was dissolved in August, 1534. The site of the monastery was granted by Philip and Mary, to a Russell, descendant of one of the late king's secretaries, in whose family it remained till the present century, when it passed, in the female line, to the Beringtons, the present possessors. The glory of the part of church still left was the six-light Perpendicular east window, which still showed a valuable series of Yorkist royal portraits. Beginning with lowest pane to south, and reading from left to right, there was a space we knew to have once contained Richard, Duke of York, now filled by a kneeling figure of great beauty, brought from some other window; next, was a full-length portrait of Edward V., who was murdered in the Tower—a window preserved by the late Albert Way, who had it drawn, and then carefully releaded and replaced; the third should be Edward IV., now lost; then, full-length figure of Queen Elizabeth Woodville, wife of the last-mentioned king, and the remains of inscription; and then four figures of ladies in one light, two of which were identified as the sisters Elizabeth of York and Katharine. Above, in the next small tier were first two canopies, then the head of the Almighty Father; the body of a bishop, with crozier and two sets of chains, the head being gone; and two blank spaces. In the head were the shields bearing arms of Edward V., diminished for eldest son, and of Edward IV., each supported on a compartment by two lions and two angels, an unusually complete heraldic representation, and another the arms of Bishop Alcock. The tiles on floor had full inscriptions, and one had been singularly misunderstood by the late Albert Way and John Gough Nicholls; both of them regarded the motto "Misereatur me, Misereatur me," to indicate a mendicants' pavement, whereas, it was but the usual sign of a monk's burialplace, being a quotation from the passage in Job, used in the office for the dead.

Little Malvern Court, which occupies the site of the monastic buildings, was shown by its owner and occupant, Mr. C. M. Berington. It is a picturesque structure of various dates, having many gables, one on west half-timbered, and on north the principal entrance under a rough-cast circular turret. The library shows some remains of the kitchen built by Bishop Alcock, and contains a choice collection of 17th and 18th-century Catholic works, and a few illuminated manuscripts and early-printed books. Mr. Berington drew out of an old chest, which once belonged to Queen Katharine of Aragon, an embroidered quilt of rich silk, Moresque in pattern, and other relics of that Queen. He also exhibited several deeds relating to the monastery, the earliest being of the 12th century, one from William, Earl of York, relating to the priory, and the finest, the grant by Philip and Mary, of the monastery to Russell. Mr. Berington held up a walnut-shaped cowhide box, of which he challenged the members to give the use, although a feature of every house a century since; no one responding at once, he said it was a gentleman's wig-box.

A stiff clamber brought the party to the summit of the

HEREFORDSHIRE BEACON,

Where, after some time had been spent in identifying and pointing out the salient features of the magnificent landscape, extending from the Wrekin to the Severn estuary, and from Edgemoor to the Mid-Welsh mountains, with portions of some 13 or 14 counties, a fierce controversy arose as to the origin of the great earthworks by which the hill has been surrounded, and was only cut short by a sudden passing storm. Mr. E. Lees, of Worcester, delivered an address, in which, after pointing out the successive deep trenches and banks by which the eastern or English side of the Beacon is defended, he offered reasons for supposing that the hill could not have been used by Caractacus as a defence against the advances of the Romans under Ostorius, as it was not on the line of march, nor was it more probable that the Romans ever occupied it, as neither coins nor other traces of their presence had been found. Indeed, the only early object found on the Malvern range was the celebrated chieftain's gold crown set with jewels, of about the ninth century, dug up at Camphill on the N.W. side of this beacon, a few bones of domestic animals and pieces of pottery recently found on Midsummer Hill, and a few bones and a fragment of a cup dug up by the Ordnance surveyors in the cairn on the Worcestershire Beacon. (The latter he exhibited, and it was described by Mr. Brock as a piece of a third or food-cup of earthenware often found in tumuli with the familiar interwoven ornament afterwards improved upon in Norman manuscripts and carving.) Whenever formed, this Herefordshire Beacon camp was a vast undertaking. The summit of the hill, an oval space 60 yards in longest diameter, was enclosed by a ditch from 12 to 18 ft. in diameter, and below this, on the eastern face, were other deep walls and fosses, the lowest complete one being 2,970 yards round. Dr. Card, a former vicar of Great Malvern, was the first to notice that only the eastern face of the hill was strongly defended, and that the summit had been so scarped and banked up, with a dip to west, that a beacon fire would be visible to all the hillsides of Wales, while it would be hidden from the plains of Worcester and Evesham. He held, therefore, that the lines were formed by the Romano-Britons or Welsh as defences against the Saxons, and that the lower entrenchments were the most recent. Mr. T. Morgan remarked that the absence of Roman remains was no convincing proof that the Romans were never there; till the late discoveries at Brading it was denied that the Romans could have been in the Isle of Wight. Sir J. A. Pictet believed, from the variety in character of the hill defences, that like many other entrenched sites, they were used by many successive races; that the higher ones were the work of hill tribes far anterior to the Roman occupation. Mr. J. Tom Burgess pointed out from the rampart that just opposite, rising from the eastern plain, was the Bredon Hill, which was undoubtedly occupied by the Romans; indeed, in sight on the east was a long line of hill tops which were held by Ostorius during the second Roman occupation, and to the north-east another series of earthworks and forts of the Cornubii; while to the north was their capital the Wrekin, and a little to the west were hill fortresses attributed to the Silures. These gigantic engineering works on this beacon might be and probably were much older than the days of the Romans; but it was impossible to suppose that such a skilled commander as either Ostorius or Caractacus would have failed to secure so important a place, lying on the very borderland between the contending nations; and although no remains had yet been found, it was probable that the beacon was held by either party several times during the twenty-five years' war, and in this view he believed Mr. G. T. Clark, of Dowlish, concurred. Mr. Burgess then described the escape of Prince Edward from Wigmore Castle, and his victory over Simon de Montfort at the Battle of Evesham in 1265, pointing out the localities as he proceeded. The party having seen a square cave chamber of very novel appearance in the Valley, then walked on to *Edgemoor Camp*, a series of less clearly defined earthworks and a weir hill to the south, and here Mr. J. T. Burgess explained the excavations made by him two years since, and showed what he held to be cattle inclosures, and three pounds

for storing water on the side of the hill. Walking single file along the *Ridgeway*, a narrow backbone of the Wenlock sandstone, with shelving declivities on either side, a steep descent led to the approach to *Branshill Castle*, some discussion arising afterwards as to whether the narrow path was a geological or military formation. Messrs. G. H. Piper, C. Lynam, Swayne, and others holding the former theory, and Messrs. Burgess and George the latter, the general conclusion seeming to be that it was the result of detrition of the rock by rain, afterwards artificially scarped and rendered uniform for purposes of defence. Of *Branshill Castle* little is left, except outer lines of ramparts, an extensive moat, now inclosing a dell, overgrown with yews and other trees, and part of the shell of a red-sandstone tower, defending the bridge to the moat, a Late structure, octagonal without, and circular within, marked with stringcourses and ornamental loopholes. Mr. G. H. Piper, F.G.S., President of the Malvern Natural History Club, read an historical paper, showing the families who have held the Castle, which was never garrisoned, and was burnt down during the last Civil War. He exhibited a tracing of Buck's view, taken in 1731, which showed two towers defending a drawbridge and extensive walling, but proved quite inaccurate in detail when compared with the actual remains.

Easton Church, seen after luncheon, was rebuilt, with the exception of the west tower, in 1852, from the designs of Sir Gilbert Scott; the feature of interest is the chapel on north-east, of the Cocks family, now represented by Earl Somers, which contains several large altarcrofts, like the church, of fourteenth-century character, in marble inlaid with coloured marbles and precious stones; that to the second Earl, by Philip, being decorated with bas-reliefs; there are also mural slabs, the earliest being one to Richard Cocks, Alderman of London, died 1623.

EASTON CASTLE,

the last place visited, is the seat of Earl Somers, and is an attempt by Robert Smirke to reproduce a castellated mansion. Sufficient is it to say that the circular flanking towers at each angle, the inadequate central keep, and the battlements, are all copied from an Edwardian castle, while the decorative details of the exterior include the dogtooth, the zigzag, and other ornaments of the Transitional Norman period. It was built between 1812 and 1824, in solid ashlar masonry, at a cost, it is said, of nearly a million of money, and with all its many and glaring incongruities the castle is an interesting specimen of the knowledge of Gothic existing at that period. The entrance hall is very large, and 60 ft. high; upon the stencilled walls are hung a series of thirty-two complete suits of Milanese armour worn by the bodyguard of Charles V. There are many portraits by Kneller, Romney, &c., and a full-length of the present countess, then Miss Virginia Pattle, by Watts, whose Tennyson, exhibited at the Academy, is hung in one of the lower rooms. The dining-room is interesting, as having been furnished from Pugin's designs, in a florid Gothic style, now quite out of date.

In the evening a paper was read by the Rev. W. S. Symonds, F.G.S., on "The Battle of Tewkesbury," and the customary votes of thanks were passed.

MONDAY.

EXCURSION TO WORCESTER.

The business of the congress formally closed on Saturday night, but three extra days were arranged for, the first, which was very numerously attended, being spent in Worcester. The members were received at the *Guildhall* (illustrated by us with its entrance-gates, last week), by the Mayor, Mr. Townshend, and upon the table were arranged the charters and the corporation regalia, including four silver maces, a double-headed sword, with richly ornamented scabbard, two punchbowls, and two jugs of Worcester porcelain, and three flags. Mr. W. De Gray Birch, F.S.A., of the British Museum, gave a description of the charters, which he said were a fine and unusually complete series, beginning with the reign of Richard I., and ending with that of Charles II. In the first granted, in 1189, Worcester was called a "vile," and the inhabitants "burgesses;" but in the second, granted by Henry III. in 1216, and all succeeding ones,

"city" and "citizens." The plain tapes or bobbins, which formerly held the seals of the first and second charters, were amongst the earliest specimens in existence of the English weavers' art. The charters were in wonderful preservation; but he would suggest to their custodian that such invaluable documents ought not to be folded, as each creasing hastened the time when they would drop to pieces; they should be kept in a portfolio, or, better still, a glass case, but ample ventilation was essential to their preservation. Mr. Birch then read a paper on "The Anglo-Saxon Charters of Worcester Monastery," of which he said there were catalogued by the Monk Hemming, at the direction of Bishop Wulstan, between 200 and 300, relating to the sale and tenure of land, the transfer of real property, — documents which possessed the highest value as throwing light on our insular history. Of these more than half had ceased to exist; twenty had found their way to the British Museum; 24 were in 1703, and probably some were now in the possession of the Somers family; and only one remained in the care of the Dean and Chapter, and that was temporarily held by the Ordnance Survey. This single remnant of the capitular manuscripts, of which a facsimile reproduction in photolithography was exhibited, was a grant dated A.D. 770 to Uhtred from Regulus, King of the Mercians. Only about 2,000 Anglo-Saxon documents are now known to exist, a number necessarily by accidents, thefts, and the lapse of time which devoured all things always diminishing, and it was, therefore, desirable that an attempt should at once be made to complete the work commenced by Kemble, and to collate, edit, translate, and publish the whole in one volume. Mr. J. Tom Burgess gave an account of the recent discoveries in the city, and stated that, beginning from opposite the Guildhall and running in the line of the thoroughfare but sometimes just under the houses, to Little Angel-street, an ancient street, paved with Roman slag, had been found from 7 to 8 ft. beneath present surface; a quantity of detritus, horns of oxen and goats, and bones of pigs, and also two small broken cups of nearly black pottery, — pronounced by Mr. Brock, amidst general laughter, to be very like Elizabethan ware.

At the *Cathedral*, the members were received by their President, the Dean (Lord Alwyne Compton) who delivered an extempore address at various parts of the edifice, describing its peculiarities, the course of the recent restoration, which he stated cost over £130,000, and the appearance of the building previously to that work. Having taken the party over the entire building, nave, crypt, choir, transepts, cloisters and chapter-house, all of which were described in connection with the Architectural Association's visit in our issue for Aug. 19 (p. 215), the Dean led them to the refectory, which stands over a series of Norman vaults (one of which fell in a fortnight since) and is now used as the King's School. It is well-proportioned, with thirteenth-century walls, into which five Decorated windows are inserted on either side, the east end being occupied by a large quatrefoil, containing a greatly mutilated representation of the Lord in Majesty, and above is the blocked-up tracery of window, and on either side Perpendicular panelling.

In the Deanery, formerly the Palace (illustrated by a plan in the *Building News* for the 12th ult., and by details of bosses last week) the Dean entertained the members at luncheon in a splendid vaulted hall in the basement, and afterwards showed them, in the drawing-room, an extensive collection of water-colour, chalk, and pencil drawings of Worcester, sketched during the past half-century by Mr. H. H. Lines, of that city, who had lent them for the occasion. These are all dated, the construction being noted, and already are of high local interest, and must increase in value, as they illustrate the cathedral before restoration with its former tower-parapet, and east front, and the disproportionately high spirelets added to each gable a century since by the architect of St. Andrew's Church spire (and now replaced by weak Decorated pinnacles by Sir Gilbert Scott); the Gwesten-hall, wantonly destroyed in 1851; St. Peter's Church, another loss to picturesque Worcester; and the old buildings and walls on the Severn front of the cathedral adjuncts.

In the afternoon the *Hall of the Commandery*

(illustrated on August 12) was visited, and described by Messrs. J. Tom Burgess, E. Lees, and John Reynolds, the latter pointing out that the roof of the hall,—now unhappily divided by a carriage-road to stables, recklessly driven through the building by the last proprietors within living memory—was probably a unique example of the transition from the collar-beam to the hammer-beam mode of treatment, having the latter style of principals, which were also tied in and had collars, and curved braces to purlins.

The party then divided, one section going over the Royal Worcester Porcelain Manufactory and its Museum, under the guidance of Mr. Binns, F.S.A., its Director, another preferring to inspect the Edgar Tower, some half-timbered houses in Sidbury, a fourteenth-century wooden archway in a passage leading from Lych-street, leading opposite the north-east transept of cathedral, and conjectured by Mr. Burgess to mark the site of the Lich-gate. All re-met at the Museum, a section afterwards walking out to *White Ladies*, beyond the Tything, to find the site of this ancient priory occupied by a modern red-brick house, the only old portion seen being a blank wall, towards the street, of masonry, broken up by First Pointed blank windows, alternately tall and short, and a vault at the street side of garden.

TUESDAY.

Between sixty and seventy members took part in the day's proceedings, which were arranged by Mr. J. T. Burgess to cover much of the ground between Worcester and Droitwich visited by the Architectural Association on the last days of their excursion. Leaving Worcester in waggonettes at 10.30 a.m., *Cragbury or Cruck-borough Hill*, was first seen. It is an isolated mound, having, according to Mr. Lees, a circumference of 1,536ft. at base and 560ft. at the summit, which is 230ft. high, and marked by a central depression, and has upon it many elm-trees. Messrs. Burgess and Lees gave descriptions, the former pointing out its resemblance to other detached hills near by, and suggesting that if the depression on the top were excavated, a cist, human remains, and pottery would probably be found. Both speakers agreed that it was a natural hill artificially scarped, but differed as to the etymology, causing a discussion, in which Messrs. Proctor Burrows, Morgan, George, and others joined. At *Spetchley Church* an interesting Tudor north transeptal chapel was seen, but time compelled the members to hurry on to *Huddington*, where some coldness and opposition to an inspection was at first offered to the members in consequence, as stated by the tenant of the Court, of the report in this journal of the Architectural Association's visit. After some conversation every facility was given to the members, who were both loud and severe in their comments on the neglected state of the church, which fully bore out the description given by another writer last week (p. 262). Mr. Loftus Brock, after pointing out the peculiarities of the church—which appears to have been unaltered with the exception of a Perpendicular window or two, and the Jacobean altar fittings, since the beginning of the fourteenth century—said the present condition of the fabric was positively dangerous, and might result in a lamentable accident before many years; but it would be surprising what a difference the judicious outlay of a few hundred pounds in rendering it water-tight, and a little cleansing, would effect. *Huddington Court* (illustrated last week), of which the exterior is the most interesting portion, was afterwards visited, Mr. Reynolds pointing out that it was somewhat older than the similar house seen last week at *Birt's Morton*, and the members drove on to *Meer Hall*, Hanbury (illustrated in the *Building News* for Aug. 19, and described last week, p. 263), down a splendid avenue of elm-trees. Here the members were welcomed by the hospitable proprietor, whose ancestors have occupied the site as a dwelling since 1330, and who himself is an excellent example of "The fine old English gentleman, all of the olden time," a race now dying out. Col. Bramble made some observations on the Bearcroft arms on the porch and in the principal room. Mr. Loftus Brock gave an address upon the house, which, he said, in spite of the date on the front (1337), was certainly not older than about 1600. He added that he had an explanation to make of a somewhat personal character. The house was altered, to suit modern requirements, by Mr. M. Habershon, the father of the speaker's partner, in 1826, and the changes were, he ventured to think, carefully executed, especially considering the general knowledge of old work existing 55 years ago. In speaking of that work, Mr. Niven, in his "Old Worcestershire Houses," had fallen into an error in ascribing to Mr. Habershon the painting of the new brickwork in black and white stripes to counterfeit half-timbered construction, and many present must have noticed that a writer in the *Building News*—a paper to which they, as an Association, were much indebted for its public spirit in specially reporting, and for the careful descriptions given of their proceedings—last week repeated the statement in connection with the Architectural Association's visit. If any representative of the journal he had referred to were present, he should feel obliged if it could be made equally public that from his personal knowledge of the late Mr. Habershon, he knew him to be incapable of recommending such a sham as painting brickwork to resemble wood and plaster; and, further than that, he had ascertained that in this instance the additions were not so treated for some years after Mr. Habershon's connection with the house had ceased. The occupant of the house confirmed this statement, stating that he could remember the alterations being made, and their first being painted over—a work now repeated throughout the building every three years.

The members lunched at *Droitwich at the Raven*, a half-timbered building, possessing in the doorway to garden a good deal of very perfect stained glass removed from the Exchequer Court, demolished some years since during street improvements; it contains the arms of the Lyttelton, Bokking, and Winter families, and the dates 1501 and 1531. Opposite the hotel is the *Salter's Hall*, a picturesque reproduction of the local brick, half-timbered, and rough-cast style; it was erected in 1879 from the designs of Mr. Harrison Fagg, and faces the *Raven Hotel*. After luncheon, Mr. J. T. Burgess and the Mayor of the Borough conducted the members through the town, which has a steaming atmosphere and dilapidated appearance, giving a summary of its history, in the course of which former he said numerous traces of its occupation as a Roman city had been exhumed in the form of tessellated pavements, coins, and fragments of urns.

St. Andrew's Church, a building containing high pews and galleries, and with every internal feature obscured by many coats of whitewash, was first seen, Mr. Burgess claiming that the Early English work in the south transept is amongst the most beautiful of its period in the county. The church formerly boasted of the shrine of St. Richard, Bishop of Chichester, and the friend of Thomas à Becket, but of this no traces can be found. It is a building presenting many curious problems, such as the buttresses projecting from the chancel-arch spandrels within the line of the debased 14th-century arcades, the human heads used as corbels to the same arch, and the curious window in south side of chancel, which careful restoration would render clear. *Doddleshill Church* is on a cliff overlooking the railway. The nave was injured during the last Civil War, a grant being made to the parish for repairs, and the chancel arch is bricked up. Nash shows the nave, of which not a vestige can now be seen, in ruins. A central tower, of Transitional character, at one time existed; but this is gone, and is replaced by a plain 15th-century tower, immediately adjoining, upon the south transept, and this second tower is said to have given the railway company some cause for anxiety lest it should fall forwards on to the line. Inside, what remains of the church is dark and in need of restoration. On the way back to Worcester, the members visited the Church and Court at *Salwarpe*, the former, a Decorated building, restored as to its chancel by the elder Hardwicke, the latter a much-altered specimen of a half-timbered house, still retaining the wide four-centered oaken doorway and door, a rich barge-board, and other features of the beginning of the 16th century.

WEDNESDAY.

VISITS TO CHELTENHAM AND LECHAMPTON.

The closing day of the Congress was spent in the neighbourhood of Cheltenham. On arriving by train at that town, the party, who numbered between forty and fifty, walked to Thirlestaine House, formerly the residence of Lord North-

wick, and afterwards of the late Sir Thomas Phillips. Here they were received by the present owners, the Rev. J. E. A. and Mrs. Fenwick, who threw open to the members the picture-galleries and a selection from the famous collection of MSS. formed by the late Sir T. Phillips. The President, the Dean of Worcester, introduced Mr. E. Maunde Thompson, F.S.A., keeper of the manuscripts in the British Museum, who delivered an address upon the paleography of extant MSS.; these, he showed, went back to about the second century before Christ, and were successively written in capitals, uncials, cursive, and manuscripts; the insertion of breathings, punctuation marks, and contractions also served to mark the date of a manuscript, and the development of illumination was also a safe guide. In speaking of the Thirlestaine collection, Mr. Thompson said the late Sir Thomas Phillips brought together no fewer than 30,000 manuscripts, largely by personal purchases; he was his own librarian, cataloguing, arranging, and binding this mass of written material with his own hands, and he also, in the course of his long life, made himself master of a considerable portion of the contents. The work was found in a chaotic incompleteness at his death, but the trustees, Messrs. Carden and Gale, had continued the cataloguing, and the collection was now opened to students under necessary restrictions, and was largely used, chiefly by Germans. On the tables were displayed a series of illustrated French and Italian manuscripts, illustrating the development of ornamentation between the 13th century and the advent of printing, and on side-shelves were shown an extensive series of Greek and Latin manuscripts, from very early periods, and English works by Geoffrey, of Monmouth; Chaucer, Gower, and other well-known chroniclers and poets. The pictures are in two galleries, planned as the letter T, and top-lighted; the larger one, which communicates with the house, is hung with a miscellaneous collection of paintings by the old masters and deceased English painters of two generations since, the subjects being chiefly sacred or portrait. At the end of this long apartment is a smaller one, forming a *coul-de-sac*, the walls being covered with Welsh and Gloucestershire landscapes by Glover and one or two other painters. The pictures would have been greatly increased in value had the name, subject, and date been lettered upon the frames, and two catalogues seemed hardly sufficient for so numerous a party.

Lechampton Church, the first seen in the afternoon, has a Late 13th-century spire of great beauty, on tower at the crossing, and having beneath it Advanced Perpendicular groining. Above the altar is a reliquary locker, with bolt-holes perfect. The windows are chiefly reticulated 14th century. The church has been recently restored by Mr. Middleton, of Cheltenham.

At *Prestbury Church* the members were welcomed by the incumbent the Rev. J. De la Bere, who explained that the church, a large and fine one, was formerly served as a priory by Llantony Abbey, and that it had been restored by Mr. G. E. Street. With the exception of lower stage of tower, it is a Late Decorated building, and still possesses its original sanctus bell over chancel-arch. On the wall of south aisle have been hung a modern oil-painting of the Blessed Virgin Mary, and also a pre-Raffaélite one, representing the Last Supper, in which the Disciples carry symbolical emblems; these and a "Virgin and Child," near chancel-arch, and the well-kept condition of the sanctuary served to remind the members that other than antiquarian associations rendered *Prestbury Church* well known. *Prestbury House*, to west of church, was also inspected; it contains some remains of the Priory buildings, including some 15th-century mulioned windows, and a fine Late open-timbered roof extending through the attics.

Bishops Cleeve Church was the last seen. The grouping from south-west is very impressive. There are transepts, with square tower at the crossing; a south porch, having Late Norman doorway and groined interior, projects like a second transept, and is connected with the other by an extension of south aisle of the 14th century, but battlemented at a later period. The rich Norman doorway and west front is flanked by square pinnacles, which have been figured in

Parker's "Introduction to Gothic Architecture," and beyond these are the Decorated aisles. The church has not been restored, except that a wretched modern east window, with poor circular opening above, has been substituted for one which, judging from the remains of ball-flower enrichment, must have been as rich as the well-known examples at Leominster and Ledbury. On entering, the chancel, clean, but bare of fittings, and whitewashed, presented an effective contrast to that just left. The nave columns are cylindrical, but carry pointed arches of great span—a second aisle or chapel, separated by octagonal columns, existing on south side. The tower-arch is supported by stilted circular arches to main building and pointed ones to the sides, but the cushion capitals, with acanthus-leaves in the fillets, show, as Mr. Reynolds observed, that the pointed form is only adopted for structural security. The south transept is shut off by lath-and-plaster screen, and in it is an elaborate Decorated recess, treated with the ball-flower and bold cinquefoil cusping; in this is awkwardly fixed an effigy of a warrior clad in chain-mail and surcoat, and bearing a kite shield and broadsword, which enabled Colonel Bramble to fix the date as c. 1265-70. The effigy which probably belonged to the recess, is a female figure, now lying against a large Jacobean monument to a Bighott in the south chapel. There is a 15th-century west gallery carried on pillars. The visit to this fine and unaltered church proved a fitting climax and close to the Congress.

YORKSHIRE ARCHEOLOGICAL AND TOPOGRAPHICAL ASSOCIATION.

THE fifteenth annual excursion of the above society took place on Monday. Helmsley was the place selected, with the object of visiting the ruins of Helmsley Castle and Rievaulx Abbey. The town was reached about half-past eleven, and the visitors at once walked to the castle ruins, situated just within the lodge-gates of Duncombe Park. Here, in the midst of heavy rain, Colonel Brooke, of Huddersfield (chairman of the council), read a paper by Mr. G. T. Clark, F.S.A., on "The Castle." The writer stated that the position of the castle, if not specially striking, was yet strong, and favourable to the operations which rendered it in former days almost impregnable. The plan of the castle is rectangular, and its earthworks are upon a scale not usual with castles of pure Norman origin, and which, notwithstanding their form, raise a surmise that they may be of much earlier date. When the Norman engineer undertook to fortify the place, he seems to have confined himself to the construction of a curtain of 10ft. thick round the inner area, placing it on the firm ground, and employing the earth-bank as a ramp against the wall. To this he added a gateway at each end, and a work of some strength as a barbican beyond the inner ditch; then a second gatehouse, placed upon the barbican; and finally, a second or outer bridge. On the west side of the inner area, where the rock was firm, a low cliff of 20ft. to 25ft. was substituted for the slope of the ditch. The keep appears to have been a square of 53ft., and although about 9ft. of it are buried in earth and rubbish, it still rises to about 90ft. Rather more than the outer or eastern half has been blown up, and has fallen into the ditch, and what remains has suffered much from alterations and additions. It is built in rubble of a very ordinary description, but with quoins and dressings of ashlar. The walls are plain, 9ft. thick, having neither string nor set-off, and but one low pilaster buttress, which rises to the first floor only, and is placed upon the west end of the north wall, to give strength to the interior stair. An addition of about 30ft. has been made to the original keep, giving it an upper or second floor. In the west wall of this addition is a pointed window in a segmental recess, resting on the old masonry. In the north wall is another pointed window and a fireplace. There is a loop towards the south, but this part of the wall, both inside and out, is obscured by ivy. In the wall of this floor, cutting the line of the windows, is a corbel-table, the corbels cut somewhat into the shape of heater-shields. This must have supported the roof, but have interfered seriously with the windows. How this story was reached does not

appear; probably by a well stair in the wall, now destroyed, a point which could no doubt be ascertained by uncovering the fragments in the ditch. The upper wall seems as thick as that below, and it is curious that there are no traces visible of mural galleries or chambers. It would seem that the original keep was Late Transition or Pointed Norman, and therefore might well have been built, as supposed, by Robert de Ros, surnamed Fursan, who held the lordship from 1184 to 1226, and probably completed the work before 1200. Then came the alteration in the first floor in a most decided Early English style, and, therefore, probably by Robert de Ros, Fursan's grandson, who married the heiress of Belvoir, and flourished between 1257 and 1285. Then followed the addition of the upper story, and of the battlements and turrets, all rather Late Decorated. This might well be the work of William de Ros, who held Helmsley from 1317 to 1342. The Domestic buildings standing opposite to the keep are composed of two blocks. One, a square mass of great height, and with walls of considerable thickness, has traces of Transition Norman or Early English work, but has undergone alterations in the Decorated period, and finally in that of the 16th century. The other, or Norman building, may be an early foundation, and probably is so, but its fittings are of the 16th century, and probably the work of the Earl of Rutland, whose armorial bearings are embossed in plaster on a deep cornice, and on the pannelled ceiling, all now in the last stage of decay. It is difficult to form an opinion upon the age of the earthworks of this castle. Either the Romans or the Normans might have laid out an earthwork on a rectangular plan; but when either people desired to construct a place of excessive strength, they employed masonry rather than earthworks. The Saxons and Early English, on the other hand, so much given to employ defences of earth, and often upon an immense scale, are not known ever to have made them rectangular. What was the practice of the Romanised Britons, who inherited something of Roman arts and military rules, and might also have derived from their Celtic forefathers a taste for works in earth, is not known. Such a fortification as the present may possibly be their work. Of course it is possible it may have been the work of Robert Fursan, especially as, remarkable as it is, it is not named in Domesday or any early record.

After inspecting the ruins, the company proceeded to the Black Swan Hotel, where luncheon was provided. Colonel Brooke expressed the gratitude of the members for the hearty welcome they had received at Helmsley. The very first object that their society had in view was to do something towards the conservation of those ruins, of a portion of which his Lordship had spoken. He said nothing about the ruins of Duncombe Hall—that was too painful a subject for Yorkshiremen to talk about—but with regard to the priceless ruins of Rievaulx, he hoped efforts might be made by their society to bring a knowledge of them within a larger area than they were at present—he meant in a scientific point of view. It was known that they were indebted to the late Mr. Edmund Sharpe for many excellent dissertations on the monasteries of Yorkshire, and especially of those of the Cistercian order. Mr. Sharpe's mantle had fallen on a member of their own society, Mr. Mickelthwaite, who would shortly give them some account of the ruins of Rievaulx Abbey, and he (Colonel Brooke) hoped and believed that an opportunity would soon be offered of throwing some light upon what still remained an unsolved mystery.

The party then proceeded in waggonettes to Rievaulx Abbey, and spent some time in inspecting the magnificent ruins. During the journey rain continued to fall, but at the Abbey it ceased for a short time. Rievaulx Abbey was the first Cistercian house built in Yorkshire, and the second in England. It dates from 1131, and was founded by Walter l'Espee, who afterwards became a monk, and was buried in the Abbey. Mr. J. T. Mickelthwaite, F.S.A., briefly alluded to the rise of the Cistercian Order, and described the architectural features of the Abbey. While Mr. Mickelthwaite was speaking, there was a renewal of the rain, which came down even heavier than before. His remarks were therefore curtailed. Helmsley was left at 5.20, and Leeds was reached shortly after eight o'clock.

THE BRITISH ASSOCIATION AT YORK.

THE Jubilee meeting of the British Association is being held at York. The opening address was delivered by Sir John Lubbock on Wednesday. The address, which is a masterly review of the progress of science during the past fifty years, will be found fully reported in the *English Mechanic and World of Science*, we can only spare space for one or two extracts.

ARCHAEOLOGY.

Dealing with the question of the antiquity of the human race, Sir John Lubbock said: "Few branches of science have made more rapid progress in the last half-century than that which deals with the ancient condition of man. When our association was founded it was generally considered that the human race suddenly appeared on the scene about 6,000 years ago, after the disappearance of the extinct mammalia, and when Europe, both as regards physical conditions and the other animals by which it was inhabited, was pretty much in the same condition as in the period covered by Greek and Roman history. Since then the persevering researches of Layard, Rawlinson, Botta, and others have made known to us, not only the statues and palaces of the ancient Assyrian monarchs, but even their libraries; the cuneiform characters have been deciphered, and we can not only see but read in the British Museum the actual contemporary records, on burnt-clay cylinders, of the events recorded in the historical books of the Old Testament, and in the pages of Herodotus. The researches in Egypt also seem to have satisfactorily established the fact that the pyramids themselves are at least 6,000 years old, while it is obvious that the Assyrian and Egyptian monarchies cannot suddenly have attained to the wealth and power, the state of social organisation and progress in the arts of which we have before us, preserved by the sand of the desert from the ravages of man, such wonderful proofs. In Europe, the writings of the earliest historians and poets indicated that, before iron came into general use, there was a time when bronze was the ordinary material of weapons, axes, and other cutting implements, and though it seemed *a priori* improbable that a compound of copper and tin should have preceded the simple metal iron, nevertheless the researches of archaeologists have shown that there really was in Europe a "Bronze Age," which at the dawn of history was just giving way to that of "Iron." The contents of ancient graves, buried in many cases so that their owner might carry some, at least, of his wealth with him to the world of spirits, had proved very instructive. More especially the results obtained by Nilsson in Scandinavia, by Hoare and Borlase, Bateman and Greenwell, in our own country, and the contents of the rich cemetery at Hallstatt, left no room for doubt as to the existence of a Bronze Age; but we get a complete idea of the condition of man at this period from the Swiss lake villages, first made known to us by Keller, and subsequently studied by Morlot, Troyon, Desor, Rüttemeyer, Heer, and other Swiss archaeologists. Along the shallow edges of the Swiss lakes there flourished, once upon a time, many populous villages or towns, built on platforms supported by piles, exactly as many Malayan villages are now. Under these circumstances innumerable objects were one by one dropped into the water; sometimes whole villages were burnt and their contents submerged; and thus we have been able to recover from the waters of oblivion in which they had rested for more than 2,000 years, not only the arms and tools of this ancient people, the bones of their animals, their pottery and ornaments, but the stuffs they wore, the grain they had stored up for future use, even fruits and cakes of bread. But this bronze-using people were not the earliest occupants of Europe. The contents of ancient tombs give evidence of a time when metal was unknown. This also was confirmed by the evidence then unexpectedly received from the Swiss lakes. By the side of the bronze-age villages there were others, not less extensive, in which, while implements of stone and bone were discovered literally by thousands, not a trace of metal was met with. The shell-mounds or refuse heaps accumulated by the ancient fishermen along the shores of Denmark fully confirmed the existence of a Stone Age. No bones of the reindeer, no fragments of any of the extinct

mammalia have been found in any of the Swiss lake villages or in any of the thousands of tumuli which have been opened in our own country or in Central and Southern Europe. Yet the contents of caves and of river gravels afford abundant evidence that there was a time when the mammoth and rhinoceros, the musk-ox and reindeer, the cave-lion and hyena, the great bear and the gigantic Irish elk wandered in our woods and valleys and the hippopotamus floated in our rivers; when England and France were united, and the Thames and the Rhine had a common estuary. This was long supposed to be before the advent of man. At length, however, the discoveries of Boncher de Perthes in the valley of the Somme, supported as they are by the researches of many Continental naturalists, and in our own country of M'Eneery and Godwin-Austen, Prestwich and Lyell, Vivian and Pengelly, Christy, Evans, and many more, have proved that man formed a humble part of this strange assembly. Nay, even at this early period there were at least two distinct races of men in Europe, one of them—as Boyd-Dawkins has pointed out—closely resembling the modern Esquimaux in form, in his weapons and implements, probably in his clothing, as well as in so many of the animals with which he was associated. At this stage man appears to have been ignorant of pottery, to have had no knowledge of agriculture, no domestic animals, except, perhaps, the dog. His weapons were the axe, the spear, and the javelin; I do not believe he knew the use of the bow, though he was probably acquainted with the lance. He was, of course, ignorant of metal, and his stone implements, though skilfully formed, were of quite different shapes from those of the Second Stone Age, and were never ground. This Earlier Stone period, when man co-existed with these extinct mammalia, is known as the Palæolithic, or Early Stone Age, in opposition to the Neolithic, or Newer Stone Age.

THE INFLUENCE OF IRON ON ENGINEERING.

Steel can now be produced as cheaply as iron was formerly; and its substitution for iron as railway material and in shipbuilding, has resulted in increased safety in railway travelling, as well as in economy, from its vastly greater durability. The introduction of iron has, moreover, had a vast influence on the works of both the civil and military engineer. Before 1830 Telford had constructed an iron suspension turnpike-road bridge of 560ft. over the Menai Straits; but this bridge was not adapted to the heavy weights of locomotive engines. At the present time, with steel at his command, Mr. Fowler is engaged in carrying out the design for a railway bridge over the Forth of two spans of 1,700ft. each; that is to say, of nearly one-third of a mile in length. As regards railways, the Stockton and Darlington Railway was opened in 1825; but the Liverpool and Manchester Railway, perhaps the first truly passenger-line, dates from 1830, while the present mileage of railways is over 200,000 miles, costing nearly £1,000,000,000 sterling.

THE NEW NATURAL HISTORY MUSEUM.

In his opening address as President of the Biological Section, Professor Owen gave some interesting particulars with regard to the New Natural History Museum at South Kensington, the erection of which he strove for twenty years to accomplish:

Experiments which preceded the substitution, in 1835, of the actual Museum of the Hunterian Physiology at the Royal College of Surgeons, for the costly, cumbersome, and ill-lit building, with its three-domed skylights, which preceded it, had led to the conclusion that the light best fitted for a museum was that in which most would be reflected from the objects and least directly strike upon the eye; and this was found to be effected by admittance of the light at the angle between the wall and roof. But this plan of illumination is possible only in galleries of one story, or the topmost in a many-storied edifice. Such system of illumination may be seen in every gallery of the museum described to you last year at Swansea, save those of the stories of the main body below the sky-lit one which necessitate side windows.

I subjoin a copy of the letter from Sir Henry A. Hunt, conveying his conclusions respecting the plan of building discussed with him:—

"4, Parliament-street, September 25, 1862.
"MY DEAR SIR,—I return you the drawings of the proposed Museum of Natural History at South Kensington. In May last I told Mr. Gladstone that the probable cost of covering five acres with suitable buildings would be about £500,000, or £100,000 per acre.

"The plan proposed by you will occupy about four acres, and will cost about £350,000, or nearly £90,000 per acre.

"Having prepared sketches showing the scheme suggested by you, I have been able to arrive more nearly at the probable cost than I had the means of doing in May last. But, after all, the difference is not great; although the present estimate is a more reliable one than the other. It is right, however, to state that the disposition of the building, as proposed by you will give you a greater amount of accommodation, and admit of a cheaper mode of construction than I had calculated upon in May (relatively with the space intended to be covered) and therefore I think your plan far better adapted for the Museum than the plan I took the liberty to suggest to Mr. Gladstone.

"Believe me, &c.,
(Signed) HENRY A. HUNT."

The working plans of Sir Henry A. Hunt were subsequently submitted for competition, and the designs of the accomplished and lamented Capt. Fowke, R.E., obtained the award in 1864. His untimely death arrested further progress or practical application of the prize designs. On the demise of Capt. Fowke Mr. Alfred Waterhouse was selected as architect. He accepted the general plans which had been sanctioned and approved by Sir H. A. Hunt and by Capt. Fowke, and I took the liberty to suggest, as I had previously done to Capt. Fowke, that many objects of natural history might afford subjects for architectural ornament; and at Mr. Waterhouse's request I transmitted numerous figures of such as seemed suitable for that purpose.

Mr. Alfred Waterhouse, A.R.A., for the realisation of the plans and requirements of our Museum of Natural History, has chosen an adaptation of the Round-arched Gothic, Romanesque, or Romaic of the twelfth century. No style could better lend itself to the introduction, for legitimate ornamentation, of the endless beautiful varieties of form and surface sculpture exemplified in the animal and vegetable kingdoms. But the skill in which these varieties have been selected and combined to produce unity of rich effects will ever proclaim Mr. Waterhouse a supreme master of his art.

I need only ask the visitor to pause at the grand entrance before he passes into the impressive and rather gloomy vestibule which leads to the great hall, and prepare him for the flood of light displaying the richly-ornamented columns, arcades, and galleries of the Index Museum.

In the construction of a building for the reception and preservation of perishable objects, the material should be of a nature that will least lend itself to the absorption and retention of moisture. This material is that artificial stone called terra-cotta. The compactness of texture which fulfils the purpose in relation to dryness, is also specially favourable for a public edifice in a metropolitan locality. The microscopic receptacles of soot-particles on the polished surface of the terra-cotta slabs are reduced to a minimum; the influence of every shower in displacing those particles is maximised. I am sanguine in the expectation that the test of exposure to the London atmosphere during a period equal to that which has elapsed since the completion of Barry's richly ornamented palace at Westminster, now so sadly blackened by soot, will speak loudly in favour of Mr. Waterhouse's adoption of the material for the construction of the National Museum of Natural History. A collateral advantage is the facility to which the moulded blocks of terra-cotta lend themselves to the kind of ornamentation to which I have already referred.

In concluding the above sketch of the development of our actual Museum of Natural History, I may finally refer, in the terms of our modern phylegenists, to the traceable evidences of "ancestral structures." In the architectural details of the new Natural History Museum you will find but one character of the primitive and now extinct museum retained, viz., the Central Hall. In Montague Hall there were no galleries, but side-lit sloons or rooms of varying dimensions and on different stories.

In its successor, the Museum developed on its site at a later period, we find galleries added: that, for example, which was appropriated to the birds and shells being 300ft. in length. This architectural organisation still exists at Bloomsbury.

The Museum, which may be said to have budded off, has risen to a still higher grade of

structure after settling down at South Kensington. In its anatomy we find, it is true, the central hall and long side-lit galleries; but in addition to these inherited structures we discern a series of one-storied galleries, manifesting a developmental advance in the better admission of light and a consequent adaptation of the walls as well as the floor to the needs of exhibition.*

COMPETITIONS.

BRENTFORD.—The Local Board of Brentford, acting on the advice of Captain Galton, to whom the 16 plans lately submitted in competition for the drainage of towns were referred, have awarded the first prize to Messrs. Gotto and Beesley, of Westminster. The selected scheme deals with the sewage by chemical precipitation in tanks to be constructed on land adjoining the Ealing Sewage Works, the sewage being pumped up from a pumping station at the river-side, close by the Soap works. The estimated cost of the works is £18,000.

SUNDERLAND BOARD SCHOOL COMPETITION.—At a special meeting of the members of the Sunderland School Board the report was received of the general purposes committee on the plans for Stansfield-street School, Monkwearmouth, to accommodate 1,300 pupils at a cost of £7,000. Upwards of fifty plans were received in competition for the prizes offered by the board. After a close contest between "Workable" and "I Work to Win," the committee finally recommended that the first prize be awarded to the plan bearing the motto "Workable," by Messrs. Rounthwaite and Shields, of Sunderland, the second to "I Work to Win," by Mr. G. G. Hoskins, of Darlington, and the third to "Study," by Mr. F. Clark, of Darlington. It was decided, on the suggestion of Mr. Wood, to exhibit the successful plans to the public in a room adjoining the Liberal Club.

CHIPS.

The director of the excavations at Epidaurus reports that he is unearthing a theatre in the forest of Asklepios which is, with one exception, the largest of all yet found in Greece which belong to antiquity. It is said to be a masterpiece of the architect and sculptor Polykleitos, and, if so, is nearly 2,100 years old. The Archaeological Society at Athens will also soon set about the excavation of the Temple of Ceres, having purchased the ground which covers it at Eleusis.

On Wednesday an accident occurred at the quarry of Messrs. Turner and Brook, by which Samuel Syres met his death, and Stephen Blackburn was seriously injured on the head that he now lies in a critical condition at the Huddersfield Infirmary. A shot had been fired to dislodge some of the stone. About ten minutes after the explosion, the men named went to see the effect of the firing, and were buried by the fall of stone from the roof. It took half an hour to extricate them.

Colonel Wilson and Mr. W. M. Ramsay are at present making an archaeological tour in Phrygia and Kappadokia. At Doghanli they have made careful drawings of the Phrygian inscriptions, our previous copies of which they have found to be very inaccurate; and they have also taken measurements of the tombs and their ornaments. One of the chief objects of their tour is to examine the Phrygian sculptures and inscriptions at Doghaz Kent and Eryuk.

On Wednesday it was determined to take steps to erect in Exeter Cathedral a memorial to the late Chancellor Harrington, who during his lifetime gave £15,000 to the restoration of the building, and by his will has left his library to the Dean and Chapter, with funds for paying a librarian to take charge of the books.

* In the notable reply (*Annales des Sciences Naturelles*, 1829) to an illustration of the unity of composition or of plan in Cephalopods and Vertebrates, by bending one of the latter so as to bring the pelvis in contact with the nape, advocated by Geoffroy St. Hilaire, Cuvier did not deem it too trivial to call in an architect to elucidate his objections. "La composition d'une maison, c'est le nombre d'appartements ou de chambres qui s'y trouvent; et son plan, c'est la disposition réciproque de ces appartements et de ces chambres. Si deux maisons ont entre elles chacune un vestibule, une antichambre, ou chambre à coucher, un salon, et une salle à manger, ou dirait que leur composition est la même; et si cette chambre, ce salon, &c., émanent au même étage arrangés dans le même manière, on dirait aussi que leur plan est la même. Mais si leur ordre est différent, si le plan, pied dans une des maisons, ces pièces étagées placées dans l'autre aux étages successifs, on dirait qu'avec une composition semblable, ces maisons sont construites sur des plans différents" (p. 245).

VIEW ACROSS THE NEW NAVE, BRISTOL CATHEDRAL.—ST. EDWARD'S SCHOOL, OXFORD.—STOKESAY CASTLE, SHROPSHIRE.—REMAINS OF WIGMORE ABBEY, HEREFORDSHIRE.—CONVALESCENT HOME FOR CHILDREN, ST. LEONARD'S-ON-SEA.—NEW CHURCH OF ALL SAINTS, FULHAM.

OUR LITHOGRAPHIC ILLUSTRATIONS.

VIEW ACROSS THE NEW NAVE, BRISTOL CATHEDRAL.

This drawing is a reproduction of one in this year's Royal Academy Exhibition. The works at Bristol were carried out by Mr. G. W. Booth, of London; the carving by Mr. Earp, of Kennington-road, and Mr. Margetson, present foreman of carvers at the New Law Courts. The two west towers are still incomplete. The N.W. tower is at the present time being carried on as far as funds will allow.

ST. EDWARD'S SCHOOL, OXFORD.

St. Edward's School, like Radley College and the Schools founded by Canon Woodward, and the College in the University of Oxford, recently built in memory of John Keble, is a result of that strong tide of deep religious feeling which, taking form under the influence of Dr. Newman and other eminent Churchmen of his standing, has stirred the Church of England into its present active and vigorous life. It was founded in 1855, by the Rev. T. Chamberlain, M.A., vicar of St. Thomas the Martyr, and senior student of Christ Church, Oxford, whose earnest and self-denying labours have been deeply and widely felt in various other ways. It was at first an experiment, but after a few years the success which it had attained, and the popularity which it had won, justified those interested in its welfare in establishing it on a more permanent basis; and it was determined to remove it out of the town, and build new premises, and Mr. W. Wilkinson was chosen as the architect. A fine site was secured, in every way suitable to the requirements of a large public school, and in 1872 the foundation-stone of the splendid range of buildings, which is now nearly completed, was laid, and in November, 1875, the first block of buildings was publicly opened by the visitor, the Right Honourable Earl Beauchamp, in the presence of the Bishop of Oxford, and a large number of persons interested in the scheme. During the last seven years the buildings have been steadily advancing towards completion. The buildings are placed in the form of a quadrangle. On the north side stands the warden's house and the school-house, capable of receiving 100 boarders, with dining-hall, classrooms, and studies, and all the requisite accommodation for that number. Connected with the schoolhouse by cloisters is the chapel. The central block on the east side contains the big school, 86ft. by 28ft., a reference library for masters and boys 50ft. by 24ft., the masters' common-room, and classroom. The south-side will be occupied by three masters' houses, in each of which there will be accommodation for thirty pupils. There will be managed on the same plan as is followed at other public schools where assistant masters

are allowed to take boarders. The boys will live in their own houses, have all their meals there, and do their preparation work there in the evenings, but will meet for all school during the day in the public school and classroom. A certain number of day-boys will be admitted, who will be at school from 9 a.m. to 6 p.m., and dinner will be provided for them in the school-house and the masters' houses. The tuition fees are fixed at twenty-one guineas a year for all. Boarders pay fifty-four guineas, and day-boys ten guineas a year which fees cover all necessary expenses. The buildings are executed with red facing bricks from Slough, with Box-stone dressings. All the buildings, except the masters' houses on the south side of quadrangle, are completed.

STOKESAY CASTLE AND WIGMORE GRANGE.

Stokesay is mentioned in *Domesday* as being held by Roger de Laci, under the name of *Stokes* (Ang. Sax. : a village). The word Stokesay is derived from *Stokes*, and *Say* the name of a family who first held the manor in the reign of Henry I. The church of Stokesay, dedicated to St. John the Baptist, was given by Hugh de Say to Haughmond Abbey in 1174. In 1281 we find Stokesay in possession of Laurence de Ludlow, and by him a license was obtained in 1290, or thereabouts, to strengthen his mansion with a wall of stone and lime, and to enclose late or embattle the same. In all probability the direct result of this was the erection of the fortified Manor House, now known as Stokesay Castle. There is a variety of delightful work in wood and stone throughout the whole of the buildings which go to make up the "Castle," and time would be well spent in making careful measured drawings of this charming architectural relic. It is a perfect picture of a Middle-Age fortified dwelling, half-house, half-castle, and in these days of reproduction of old work for its own sake, it is marvellous that no architect has found a client sufficiently enterprising to commission for an exact replica of this quaint old residence, with moat-entrance, gateway, tower, great hall, &c., complete. The sketch shows a portion of the N.W. side, with projecting chambers over the moat.—The sketch given of Wigmore Abbey, now known as Wigmore Grange, shows the only remaining portion of what was once, according to Dugdale, a monastery of the order of St. Augustine, and founded and endowed by one Hugh Mortemar (whose father, Rulph, came over with the Conqueror), about 1179. There are still in existence sufficient indications that the monastic buildings covered a very considerable area; but, beyond a few pieces of carving, caps, mouldings, &c., there is now little remaining intact, save the subject of sketch. This is supposed to have been the Fratty or Refectory. The roof timbering is very fine, of enormous scantlings, and quite worth a detail drawing. Many of the Mortemar, (or Mortimer, as it was afterwards spelt) family were buried here, and, amongst them, five Earls of March. Owing to the fact that the present proprietor has come into collision with the townspeople of Ludlow on the matter of common rights to the land adjoining his property, there is some little difficulty in obtaining entrance to view this charming old house. This is a matter of regret to all who take interest in old work of this description, as Ludford House is one of the best-preserved representative dwellings in the district.

CONVALESCENT HOME FOR POOR CHILDREN, ST. LEONARD'S-ON-SEA.

The subject of our illustrations is now being erected upon a site granted by the Eversfield Estate, at the extreme western end of St. Leonard's, and close to the West Marine Station on the L.B. and S.C. Railway, and is the development of a work which has been carried on for some years in a private house near Warrior-square, the object being to provide fresh air and proper nourishment to convalescent children, from London and other large towns, who have been suffering from non-infectious maladies. The buildings as illustrated, and which are now fast approaching completion, have ample accommodation provided for 25 children of each sex in the wings, and for several more in the central block, should such be required. There is also infirmary accommodation provided, so that isolation may be effected should any case of infection occur. The walls up to the first-floor level are built hollow and faced with picked

local red kiln bricks, Suffolk bricks being used for the quoins; local clamp bricks are used above, covered with red ornamental tiles on quattering; the gables have wood framing filled in with rough-cast. The roofs are covered with a dun-coloured tile laid on felt and matched-boardings. Both the roof and hanging tiles are set in lime and hair, and are nailed to sawn slate-battens. As the ground falls rapidly to the west it was deemed advisable to place the kitchen and offices in the basement, thus utilising space which would otherwise be thrown away; a small covered playground, for the use of the boys in bad weather, is also available. Mr. Charles Hughes, the builder, is carrying out the works under the superintendence of Messrs. Fowler and Hill, architects, of London and St. Leonard's-on-Sea.

NEW CHURCH OF ALL SAINTS, FULHAM.

The parish church of Fulham, dedicated to All Saints, had been so often added to and altered that, as it existed previous to the late rebuilding, scarcely a vestige remained of the original church except the tower. In pulling down nothing was discovered of any date apparently earlier than the latter part of the fourteenth or the beginning of the fifteenth century. The tower, which was restored by Mr. Godwin about forty years ago, remains untouched. In consequence of greater frequency of abnormally high tides, which not only come into the churchyard but have flooded the church itself more than once during the last few years, it became absolutely necessary to raise the floors at least three feet, and it was then determined to undertake the entire rebuilding. Some windows which formed part of a scheme for rebuilding, a very small portion of which only was carried out many years ago, had to be preserved and incorporated into the new design, with which they do not entirely harmonise. The style of the new building is Perpendicular, the materials used being Kentish rag with Bath-stone dressings. The roofs are of pitch-pine; the seats, with the exception of those in the chancel, which are of oak, are of the same material. The church has been designed to have all the windows filled with stained-glass for which a scheme has been prepared, and with a view to future coloured decoration. The contractors were Messrs. Goddard, of Farnham. Mr. J. Vaughan was clerk of the works. The carving was executed by Mr. Earp. The stained glass already executed is chiefly by Messrs. Henton, Butler, and Bayne.

THE CITY CHURCH AND CHURCHYARD PROTECTION SOCIETY.

A SPECIAL meeting of the Council of the City Church and Churchyard Protection Society, presided over by Mr. J. Clarke Mould, solicitor, was held this week to receive the report of Mr. Henry Wright, honorary secretary, on the proposed destruction of St. Matthew's, Friday-street, a church with a good congregation at both Sunday services, the rector of which is the successor and a minor canon of St. Paul's Cathedral, Dr. Sparrow Simpson. Mr. Wright stated he had read the whole scheme of the proposal for the union of benefices of St. Matthew, Friday-street, and St. Vedast, Foster-lane, of which he gave the council a summary. After considering the various proposals in the draft, and particularly objecting to the sum of £1,500 being spent on a rectory house, which is not tenanted, and the handing over of £700 to the parish of St. Matthew, the council expressed their surprise that the vestry of St. Vedast should demand £1,500 to be spent on that church, when but two or three years back they informed the then rector that the church stood in no need of reclamation, and the more so, as there are ample parochial funds without robbing the proposed new district.

The following resolution, proposed by Mr. G. H. Birch, A.R.I.B.A., and seconded by Mr. Bowes A. Paice, A.R.I.B.A., was unanimously carried:—

"That the Council of the City Church and Churchyard Protection Society, whilst admitting there may be no special beauty in the Church of St. Matthew, Friday-street, yet consider that every opposition should be offered to its proposed destruction both from principle and on account of many of the provisions in the scheme for the Union of Benefices."

The council also expressed their determination to oppose any legislation which would remove these ancient landmarks of the City.

AN

OUR COMMONPLACE COLUMN.

ORIEL WINDOW.

THE word Oriel (Med. Lat. *oriolum*, probably dim. from *os, oris*, as if a small opening or recess) formerly meant a chamber or apartment, now used to designate a projecting window. An oriel window seems to be generally applied to a bay window carried on projecting corbels, and they were common in Tudor and Elizabethan times.

ORIENTATION.

We add to our former notice of this subject the following exhaustive remarks from "Chambers's Encyclopedia" under this head:—"Modern observation has found that few churches stand exactly east and west, the great majority inclining a little either to the north or to the south. Thus of three ancient churches in Edinburgh, it was ascertained that one (St. Margaret's Chapel in the castle) pointed E.S.E.; another (St. Giles Cathedral) E-by-S $\frac{1}{2}$ S.; a third (Trinity College Church, now destroyed) E. $\frac{1}{2}$ S. . . . Its origin or cause has not been satisfactorily explained. Some have supposed that the church was turned, not to the true east, but to the point at which the sun rose on the morning of the feast of the patron saint. But, unfortunately for this theory, neighbouring churches, dedicated in honour of the same saint, have different orientations. Thus All Saints at West Beekham, in Norfolk, points due east, while all All Saints at Thwaite, also in Norfolk, is 8° to the north of east. There are instances, too, in which different parts of the same church have different orientations—that is to say, the chancel and the nave have not been built in exactly the same line. This is the case in York Minster and in Lichfield Cathedral. Another theory is that orientation mystically represents the bowing of our Saviour's head in death, which Catholic tradition asserts to have been to the right or north side. But this theory is gainsaid by the fact that the orientation is as often to the south as to the north. Until some better explanation is offered, it may perhaps be allowed to hold that orientation has had no graver origin than carelessness, ignorance, or indifference." We are inclined to agree with this conclusion, in spite of the examples which are brought forward by some ecclesiologists to establish their favourite theory.

ORNAMENTS.

This kind of metal consists of 25 parts of zinc and 75 parts of copper, which has a nearer resemblance to gold in colour than brass. For ornamental mounts for furniture, clocks, &c., it is largely used. The colour of the casting is brought out by a pickle of dilute sulphuric acid, after which the acid is removed by water, and a liquor-varnish is put on to keep it from tarnishing.

PAINT.

For a general knowledge of this material we refer the reader to "Notes on Building Construction," Vol. III., "Materials," and to other textbooks. The bases commonly used are white-lead, red-lead, zinc-white, oxide of iron. The vehicles used for mixing are oils, spirits of turpentine, and sometimes a "drier" is added such as litharge, acetate of lead, sulphate of zinc, &c. White-lead is often adulterated with sulphate of baryta, which absorbs little oil and is rather gritty if rubbed between the fingers. For woodwork white-lead affords the best protection, and has a good body, but sulphur acids blacken it, and it is injurious to those who handle it. Zinc white has been lately much used and its advantages are beginning to be appreciated. This paint has been described in the BUILDING NEWS, and is known for its intense whiteness, its non-poisonous properties, and its being able to resist sulphurous fumes without turning black like white-lead paint. Oxide of zinc is the basis of zinc paint. The zinc-white does not combine so readily with oil as white-lead, and it is acted upon by the carbonic acid in rain-water, and therefore weathers badly. We refer to Dent's "Chemistry of Building Materials," and "Notes on Building Construction," for the advantages and disadvantages of zinc paint, though it may be sufficient to say it is now made of a superior quality, and is preferable to white-lead for painting on dark grounds. The Albissima White Paint Co., Lime-street, E.C. products were lately described in these pages. For adulteration of paints, see Art. by Prof. Cotton in B.N., Vol. XIX., p. 66; see also Vol. XVI., p. 558. We quote the following composition for

colouring gates, poles, brickwork, &c., from the "Arch. Diet.":—"Melt twelve ounces of rosin in an iron pot, and three gallons of train-oil, with three or four rolls of blinestone. When the rosin and blinestone are melted and become thin, as much Spanish brown, or red, or yellow ochre (or other colour) ground fine, with oil as usual, is to be added, as will give the whole as deep a shade as desired; it is to be laid on as hot and as thin as possible; some days after the first coat is dried, a second is to be given. It is well attested that this composition will preserve plank for years, and prevent the weather driving through brickwork."

To remove paint:—Paint is generally removed by red-hot irons or a flame from a lamp. (See B.N. 1870, p. 281.) A portable firegrate is commonly used, filled with burning coke, and chemical mixtures for softening paint are on request. For carved work, caustic potash is recommended, which comes off with the old paint in washing. Chloroform applied on wadding with gentle friction speedily exposes the surface of wood.—BUILDING NEWS, 1866, p. 125. To clean paint, whitening rubbed over the surface with a piece of flannel in warm water is a good means. Flatted work can be cleaned in this manner, and alkalis are to be avoided. For particulars of fresco, encaustic, and tempera painting, we refer the reader to Gambier Parry's paper, reported in the BUILDING NEWS, Vol. for 1866, 759.

PAINTED GLASS.

For an historical account of this subject we refer the reader to Winston's "Art of Glass Painting." Painted glass must not be confounded with coloured or stained glass; the former is glass painted upon its surface with vitrifiable colour and burning it in; the latter is glass coloured in manufacture. In stained glass, the colour sinks in and leaves it as transparent as at first. Glass-painting dates since the Christian era, and Mr. Westlake, F.S.A., in his recent "History of Design on Painted Glass," lately noticed in these columns, says, it is probable for nearly a thousand years after Christ this art was unknown. He is of opinion that the earliest painted windows were not, as sometimes thought, of German origin, but from the neighbourhood of Limoges, where a Venetian colony, under Doge Orseolo II., settled somewhere about the year A.D. 973. Mr. W. H. Brewer says the earliest figure-window in Germany is in Augsburg Cathedral, the nave of which was completed circa A.D. 1065. It is certain that great difference of opinion exists as to the origin of the art. Many have confounded the much earlier art of combining pieces of coloured glass together with painted glass. Mr. Westlake illustrates some fragments of a window from the cathedral of Le Mans, in France, as showing Greek characteristics in the figures, or a Byzantine rendering. One of the windows in question represents the Ascension, and was placed in the cathedral according to a manuscript in the library of Le Mans, in the 11th century. The fragments bear internal evidence, says this author, of belonging to the childhood of the art. The hair is painted in solid black, a crude manner of showing it, and anterior to the later conventional manner of drawing it in lines. Chartres was an important centre of the art, for the Jesse Tree is a remarkable example belonging to the 12th century. The ruby and blue tints are rich in variety of tone. The glass at Angers, St. Denis, and other French churches, is discussed by Mr. Westlake, who shows that the art is of French origin, and that it afterwards made its way to England and Germany at the close of the 12th century. Few English churches had any quantity of painted glass before 1200. In the 13th century "Medallion" windows became common, and beautiful examples are found in Canterbury, Lincoln, Salisbury, Westminster, Peterborough, and in many French cathedrals. These windows were composed of small subjects, representing a series of events in Our Saviour's life, or histories of saints, or typical emblems. The backgrounds are chiefly ruby or blue. Illustrations of these are given by Mr. Winston and Mr. Westlake; the medallions were arranged in geometrical forms upon iron frames of L-shape. The window in the crown of St. Thomas, Canterbury, is a good example, and is illustrated by Mr. Westlake. Grisaille work, and painted quarry glazing is an important development of the subject, and this kind of work may be seen at Lincoln Minster, Salisbury Cathedral,

&c. Grisaille was largely used in the 13th century, the chief part of the window is of white glass, slightly tinted, and the ornamentation is geometrically disposed. The earliest type of design consisted of interlacing bands, the next of a series of flat geometrical forms filled with foliated ornament, painted on whitish glass, and often outlined with bands of colour. In the latter type the foliation overruns the lead glazing of the quarries. Beautiful examples are to be seen at Salisbury. This sort of ornamental glass is less costly, and has the advantages of being translucent, and easily harmonised with the architecture, being entirely conventional and flat in treatment. The process of glass-painting is simple. White glass is laid over the design in pieces adapted for the subject, and joining together. The outline is traced on the glass with a black or brown pigment, the differently coloured parts are then coated with the proper tint, and the glass is then fired. The other necessary colours and shading are then put on, as in enamel painting, after which the glass is again fired. Glass coloured in the manufacture, called "pot-metal," is often introduced in the draperies and other parts, and touched up or shaded. The pieces of glass are then united by the leadwork.

PAINTING-ROOM.

Rooms for this purpose should be arranged so as to afford the artist the desired light he requires, and nearly every artist has his own views of the subject. The simplest room adapted for painting is one about 19ft. by 16ft., in which the painter can have a uniform light, without sun-line. A north window is, therefore, desirable, so that the direction of the axis of a painting-room should be east and west, or nearly so. A well-planned studio should be placed on the upper floor, accessible by two stairs, one being for the "model"; the windows looking north ought to be high, reaching to the ceiling, or, better still, partly above it, as a skylight, on the slope of roof. There should be carefully-fitting shutters to adjust light, a lobby, and a lavatory and sink, a dressing-room near, and a cupboard for brushes and the cleaning of palettes, &c. In some recently-built studios, the north slope of roof is entirely of glass, with windows below. Some useful descriptions of painting-rooms are given in the "Arch. Diet." under this heading, "The ordinary painting-room," one writer says, "is, whenever possible, placed immediately under the roof. It is usually provided with two windows only of varying widths, commencing at varying heights from the floor and extending as high as the roof, and into it as a skylight for a further distance of 5 or 6 feet. Each of these windows is fitted with shutters either folding in two or three heights, or hung with lines and pulleys, or revolving and rising from the sill. Thick blinds are also fitted to the skylights, descending from the top. It is well that the windows should be as free from shadow as possible; hence the desirability of omitting the wall-plate across the junction of the sash and skylight, which suggests external buttresses on either side of the window or other structural features, which shall indicate within or without the living want of the studio. At one of the windows described, the artist paints; at the other the model is placed, and near this latter window a stove or other means of creating a special warmth for the nude, or partially nude, figure must not be forgotten. Such a window, however, casts decided shadows upon the model it lights, and on this account is not always approved. An artist, indeed, whose pictures are noted among those of Royal Academicians for the delicacy of their tints and shadows, paints at such a window, in a studio 27ft. long, 16ft. wide, and 14ft. high to the collar of roof, while for the model he has had a bow window constructed at the east end of his studio. The opening leading to this window is 8 feet wide and 8 feet high, fitted with sliding doors, so that the whole window or any part of it can be excluded from the studio. The window on plan forms five sides of an octagon, 12ft. 9in. across. It is glazed all round and at top, the glass commencing at a height of 2ft. from the floor. It is well fitted with thick blinds, which can be drawn over any part, and in it is placed the stove for the model. Sometimes a curb roof is erected, the steepest slope being so inclined that the sun does not shine on it in the summer; a gallery at one end of a studio is useful. Wrought-iron

casements have been used to prevent shadow, and plate glass is preferable to any other. Windows of 7ft. wide are sufficient, and a south window with folding shutters is a useful addition. A recess for meditation, leading out of the studio, is sometimes added for the repose of the artist (see description of Studio in "Arch. Dict.") Two staircases, one for artist and his friends, and the other for the "model," leading to the dressing-room, are required, and a large trap-door ought to be provided for canvases to be let down and taken away (see *Building News*, Vol. XXX, 366), where particulars of Mr. Millais's house at Palace-gate, Kensington, are given, and also plans lately published of Artists' Homes.

PALLADIAN STYLE.

The distinguishing characteristics of this style of Italian architecture, introduced by Andrea Palladio, are arrangements in which columns are employed. These are usually superposed in tiers; the doors and windows are simply treated, the order is preserved in the details; pedestals with panels and carving were avoided, and a symmetrical setting-out is preserved. The proportions of orders are often varied, but never fall into the extravagance and licence of those of other revivals. The Palladian style occupies a place between the vigorous severity of the Classic style and the more florid examples to be found in Venice. The Barbarano Palace, Venice, is a good example of Palladio's style. There are some littlenesses in even his work, as windows cutting into architraves, weak balusters, offensively wide intercolumns, meagre entablatures, which have been pointed out. The style was introduced into England by Inigo Jones, whose fragment of the Banqueting House, at Whitehall, may be taken as a good example of this manner of building. Wren, Gibbs, Chambers, and other architects also worked in the style, and have reproduced its details.

PALMYRA OR PORCUPINE WOOD.

This wood is often used in veneers and inlaying. It is a speckled wood obtained by cutting transverse sections, chiefly of the *Coccoloba ferr.*, the cocconut-palm; the pieces are consequently small. ("Arch. Dict.," and "Chambers's Encyc.")

PAN-CLOSETS.

For particulars of these see any sanitary catalogue. The defects of this form of apparatus have often been pointed out in these pages. The pan is a metal dish worked by levers to receive the water, and to act as a trap at the bottom of basin. The basin has a metal receiver or "container," in which the pan works, and which is connected with the D-trap and soil-pipe. The container soon gets foul, and becomes a receptacle for sewer-gas; hence it has been superseded in all good closets of the "valve" kind. The by-laws issued by the Local Government Board 1877 for new streets and buildings expressly prohibits the fixing of a container under any pan or basin.

PANOPTICAL PLANS.

THESE are buildings arranged on the radiating system, so that a single person can supervise a large number of inmates. Jeremy Bentham's brother, Sir Samuel Bentham, brigadier-general, is mentioned as being the originator of the system about 1787. He prepared plans for a panopticon for 1,000 convicts, but it was abandoned. The Penitentiary in Coldbath-fields, London, by C. Middleton, 1788-94, is designed on this system; it has its central buildings and rays. The castle at Chester is said to have been the first prison built on this principle in England, 1793-1820. The Dartmoor prison is partly planned on this system, also the Pentonville prison for 520 prisoners on the separate system, designed in 1840, by Major Jubb. (See "Arch. Dict.")

PARADISE OR PARVISE.

UNCERTAIN in origin, but supposed to be a corruption of *par*, "an enclosed garden." A paradise or parvise is an open place surrounded by a stone parapet in front of a cathedral, and was probably used to keep the people from pressing on and confusing the marshalling of the public processions. That at Notre-Dame is irregular in shape, at Amiens it was round. Parvise is also the name of a small chamber over a porch. The cloister at Chichester is called a paradise. ("Encyc. Brit.") See also Hunt's "Fedor Arch."

PARGET-WORK.

This term is applied to the ornamental plastering between studwork of half-timber houses. The patterns or devices were impressed or scratched while the plaster was wet. Raised patterns or relief, such as are seen at Ipswich and other places, are another form of decoration in parget. We refer the reader to an article in *Building News* of last week, p. 251, and for interesting particulars of examples to "Notes on Pargetting" in Essex Archaeological Society *Transactions*, 1873.

PARQUETRY.

THE *Parquet*, an enclosure.—It appears that wood flooring laid in patterns is of ancient origin. Evelyn notices a room at Chisibury parqu岸ted with yew, 1680. On the Continent the ordinary method is to draw the pattern on the floor prepared to receive the parquet, and then to lay down piece by piece. We refer the reader to the solid parquetry of Messrs. Arrow-smith, to Messrs. Howard and Son's parquet, lin. and $\frac{1}{2}$ in. thick (Berner's-street), J. Eberhard and Co.'s excellent floors (Hampstead-road). Many of these we have described.

PARTY-WALL.

For information on the rights of adjoining owners, we refer the reader to the Metropolitan Building Act, 1855, c. 122, also to Gleason "Easements," Woodfall, "Landlord and Tenant"; Hunt's "Law of Boundaries and Fences," 1870; Woolrych's "Law of Party Walls"; Grady's "Law of Fixtures," also to article on "Party Walls and Fences," in the *Building News*, 1881.

PAVEMENT.

AN exhaustive article on the various sorts of pavements for foot-traffic will be found in the "Arch. Dict." *Brick-paving*.—Bricks are best laid dry, and then grouted with lime and sand, or with sand only.

36 bricks per super yard laid flat, $9 \times 4\frac{1}{2}$ in. = 36 in.
60 $\frac{1}{2}$ " " " on edge, $9 \times 2\frac{1}{2}$ in. = 21 in.

Marble mosaic and Roman mosaic pavements are manufactured by several well-known firms. We may refer to the excellent marble mosaic paving of Messrs. Burke and Co., Newmarket-street, Oxford-street; to the Roman Mosaic pavements of W. B. Simpson and Son, St. Martin's-lane; to the encaustic tile-paving of Maw and Co., Broseley; and of Malkin, Edge, and Co., Burslem; Carter and Co., Albert Embankment, and to numerous other manufacturers. For stable-floors, landings, platforms, and for fireproof floors the "Eureka" concrete, lately described by us, is well adapted; and concrete paving has taken the place of brick-paving for all sanitary and fireproof purposes.

PAVILION SYSTEM.

THIS describes a system largely adopted for the planning of hospitals, and it was recommended, says a writer in the "Arch. Dict." as far back as 1788. Each ward by this plan is separated, and is surrounded by light and air, being connected only by the corridors generally placed at one end. The chief hospitals built on this plan in England are the Military or Herbert Hospital at Woolwich (see *Building News*, Vol. for 1862), and the St. Thomas's Hospital, London, designed by Mr. H. Currey, many other hospitals have been designed and carried out on the same principle. The Royal Military Hospital at Netley, by W. Mordaunt, is on the "corridor" system, and represents another and rival plan of construction. Numerous plans and articles illustrating "the pavilion" system have been given from time to time in this journal. The same principle has been largely used for union infirmaries, as in the St. George's Union Infirmary, Fulham-road, by Mr. H. Saxon Snell. In this case a long corridor connects seven such pavilions at the ends of the blocks, between which are recreation grounds of about double the width of each block or pavilion. The staircase, lift, and nurses' room are placed at the corridor end of each pavilion. The pavilions are four stories in height, and each ward contains 28 beds.

PEEL-TOWER.

(W. *pell*, a stronghold, a fortress; Lat. *pila*, a stake, pillar.) This name is given to the towers erected on the Scottish borders for defence.

They are square, with turrets at the angles, and the door is sometimes at a height from the ground. The lower story is usually vaulted and formed a stable for horses, cattle, &c. In Scotland peels were built as late as the 16th century in close imitation of a Norman keep. The peel at Dornack is one of the best preserved. It has four floors, with an apartment in each; the original doors and locks are still in use. ("Chambers's Encyc.") See also "Hist. of Peebleshire," by W. Chambers, and "Arch. Dict."

HASTINGS AND ST. LEONARD'S-ON-SEA.

THE twin towns of Hastings and St. Leonard's are situated, as most of your readers well know, on the south-eastern coast of Sussex, some 60 miles from London. They are well-known as a seaside resort for invalids and others requiring change of air and scene. The towns have increased within the last ten years much in popularity and population, and consequently in area as well, and the natural result of this has been the development of much energy in building in and around the neighbourhood. The larger part of this building has been, of course, directed towards providing additional house accommodation for residents and visitors, and this in its turn has necessitated new public buildings of all descriptions.

I propose in this article to give short critical notes as to the architectural character and interest of some of these new buildings, which may be of service to such of your readers as may be visiting the towns. Cement plaster is the material most commonly employed to finish a large number of the houses here, and although used in the majority of cases, somewhat less offensively than is to be found in some towns, still presents the monotonous effect always characteristic, no matter how judiciously treated, of the almost endless quantity of plaster. Here and there, of course, there are exceptions, and these isolated buildings, in other and more cheerful material, possess a greater value from the dullness of their setting, so to speak, than would otherwise be the case had they been placed amongst more cheerful surroundings.

The Esplanade is, perhaps, one of the finest extant, extending as it does from the fish-market, the extreme eastern point of Hastings, to Bopeep, the westernmost point of St. Leonard's, a distance of over three miles. Along the whole of this frontage are built houses in terraces, finished entirely in cement, many of which, despite the monotony of the material, possess considerable dignity not to be found in the later and more extravagant treatment of houses finished in this material. At about the centre of this sea-frontage, and opposite Verulam-place, juts out into the sea the pier, a very large and important structure of its kind, constructed mainly of iron. At the seaward end, raised upon an upper deck, is a large and capacious saloon, capable of seating from 2,000 to 3,000 people. At the four corners terminating at the top in octagonal enpolas are accommodated the refreshment buffets, cloak, and rearing-rooms. A fairly good band discourses music here daily, to the pleasure and possibly instruction of the visitors and residents. The upper deck immediately outside the saloon forms a covered verandah, and with the lower deck in fine weather is the favourite lounge of many of the visitors and the town's. The whole of the construction of the saloon and pay-boxes, as the pier generally, is of iron and wood, treated in a Moorish style of architecture. The colouring, however, is very weak, and anything but characteristic of the style adopted for the architecture. The Hastings Baths, but recently completed, at Whitelock, under the Parade, are a great acquisition to the town, as well as a great improvement to the Parade. Admission is gained to them by descending flights of steps into two large open courts, one leading to the gentlemen's and the other to the ladies' baths. The gentlemen's swimming-bath is said to be the largest tepid-bath in the world. It is finished inside generally with e loured brick-work and ornamental tiling, the boxes being, if I remember rightly, stained and varnished. I think the tiling round the edge of the bath a great mistake, as, when wet, it is slippery, to a dangerous extent. Of this I can speak feelingly, having sustained, some time back, a very severe fall, owing to the slippery state of this tiling,

which I am not likely to forget soon. The roofs, forming the parade over, are constructed of concrete, bedded between small iron joisting, at very frequent intervals. The several baths, which comprise very many different kinds, are lighted by means of large skylights, constructed on the parade, around which outside are placed seats. These appear to be in great favour during the summer months, forming especially the morning lounge of the residents and visitors. Both of the entrances, together with the courts below, are finished in red brick and red and buff terra-cotta, rendered in a Romanesque form of Gothic. They are of a very ornate character, and of very fair design. The colour, however, of the terra-cotta and brickwork is not very good, the least agreeable in this respect being the buff terra-cotta and the brickwork. The architects to this work were Messrs. Jeffery, Skiller, Cross, and Willis, of Hastings, and they may be congratulated upon the result. Rock and Co.'s carriage factory, Whitelock, close by, attracts attention by its pretentiousness. The front towards the sea is executed in Bath-stone and red Mansfield, rendered in a sort of segmental Gothic, entirely devoid of feeling or refinement. The bays especially strike one as being extremely coarse and heavy. The insertion of the coloured-tile knobs into the stonework is not a happy idea. Apart from the details which spoil the whole front, the treatment of the elevation deserves some notice for its bold conception.

Turning into Robertson-street, we come to the Holy Trinity Church, erected some fifteen years ago from the design of the late Mr. S. S. Teulon. Although a clever treatment of a most trying site, the building is not by any means equal to the general work of its architect. It consists of a nave, chancel, and one side-aisle; the tower, or so much of it as is built, occupying the S.E. end of aisle. The material employed outside is Rag-stone, and, I believe, Caen-stone dressings. This last is decaying very rapidly, and serves as a warning against injudicious selection of stone. The style may be said to be Fourteenth-century French Gothic, with much feeling in the details. The chancel end, though small, is very cathedral-like in expression. In Claremont, immediately opposite the western entrance to the church, is the Free Public Library, recently erected at the cost of Sir Thomas Brassey, from the design of Mr. W. Vernon, of Hastings. The Science and Art School for the town is also accommodated. Here the building is red brick with stone dressings, Domestic Gothic in character, with scarcely enough unity in the design. The tile friezes somewhat unseal the front. The printing premises adjoining, by the same architect, should be noted for its sgraffito decoration. Proceeding through Robertson-street we come to the "Albert Memorial"—a clock-tower, built in stone, of a weak and undigested form of Gothic, otherwise incapable of description. The London and County Bank close by is a stone-fronted building possessing an unobtrusive Classic facade. The new Post-office, in the Meadow-road, is a very fairly-designed Classic structure of a rather bold expression, and thoroughly characteristic of the Post-office Administration. Proceeding along the Meadow-road, we come to the new municipal buildings just upon completion. I think that it is much to be regretted that the Town Council of Hastings, after having put the profession to the expense of two very large and important competitions, should have taken the work from the hands of the selected architects—viz., Messrs. Jeffery, Skiller, and Co., only to result in the present structure. The building has been carried out under the superintendence of the borough surveyor; the materials used are ragstone, with freestone dressings; the style is a very discordant form of French Gothic, entirely devoid of all feeling, congruity, or scale. The mullions and mouldings generally are of the weakest description imaginable, while many of the other features are coarse and vulgar in the extreme. Especially objectionable are the chimney-stacks to the front. The stone diapering to the elevation of court facing the cricket-ground is particularly weak and meaningless, and had better been omitted. Undoubtedly the best front is that towards the Station-road, which shows some power of composition and improvement in some of the details. The building generally is sadly wanting in the dignity and character that should and might have marked the chief public

building in Hastings. The middle-class girls' school in the Wellington-square has a well-designed exterior in red brick and stone; the style may be said to be a quiet domestic treatment of Gothic, of suitable expression. The entrance is happy, but the details would have admitted of a little more study. The architects were Messrs. Jeffery and Skiller, of Hastings. The old town-clerk's office in Bank-buildings, is an example of an appropriate treatment of stucco. It is treated purely as a plastic material, and the result is worthy of notice. The best piece of school architecture in the borough, I think, is the Robertson-street Chapel Schools in Priory-street, built from the designs of Mr. W. Vernon. It is a pleasing treatment in red brick and stone of a modified form of Gothic, the various parts of which are well broken up. The least satisfactory part is the parapet, which is out of scale, and far too obtrusive. Again, the effect of the pinnacles to side of dormers, cutting into the crown of the arches to first-floor windows, is scarcely happy. The little carving here is very good, and is, moreover, judiciously applied. The Holy Trinity Schools, near the station, are pleasing in colour and grouping, but are very toy-like in their proportion and effect. They are built in red brick and stone with green slates to roofs, from the designs of Messrs. Jeffery and Skiller.

The convent church in the St. Margaret's-road, St. Leonard's, designed, I believe, by the late Mr. Pugin, is a fine building in Decorated Gothic, and appears to be worth a closer inspection than is to be obtained from the road. The chancel windows have an especially good effect. Further on in the same road is the St. Mary Magdalen Church, built some years ago from the designs of Mr. Murrable, I believe. It consists of nave, chancel, two aisles, and a south-western tower; the style is Late Decorated. At the top of the Church-road (we are now in St. Leonard's) will be found the St. Paul's Church, perhaps the most fashionable church in the two towns. It is a large building, of a very ornate character, and was erected about 1868 from the designs of Mr. Norton; the style is Early Geometric French, well and boldly treated. It consists of a nave, chancel, two aisles, morning chapel, and a N.E. tower at present without a spire. The exterior is built with rag-stone in coursed rubble and stone dressings, the interior being finished in red brick with ornamental tile dados, &c. The chancel is very highly finished in much richer material. Above the church lies the Magdalen Charity Estate, where there are a large number of new houses ranging in value from £1,200 to about £4,000. The majority of these are built of red brick, with stone dressings, to very fair designs of great diversity in character. Their best features are their plans, which are very complete and effective in accommodation. With but one or two exceptions the whole of these new houses have been built from the designs of the estate surveyors, Messrs. Jeffery and Skiller, and are certainly a great improvement on the usual estate architecture. St. Paul's Schools, on the same estate, evidently provide for a large number of scholars, and are built in red brick and stone to a style harmonising with the houses just mentioned. The Crèche immediately adjoining them can scarcely be considered successful. The Warrior-square Concert-rooms, just opened, are built in red brick and cement to a crudely-treated design of French Renaissance.

The best church in the borough, to my mind, is that known as Christ Church, in the London-road, St. Leonard's—a very large and assertive structure, which, owing to its great height and the general simplicity of its design, has an expression of great dignity. It consists of nave, chancel, two side-aisles, narthex, morning chapel, and a north-eastern tower. This latter has the inevitable "money-box" till such time as funds permit of its being completed. The nave and chancel are barrel-vaulted in wood, running through to the same ridge-line, the chancel being emphasised by the addition of colour decoration. The aisles are unpierced, and entirely subordinate to the nave, which is of great height and has a very boldly-treated arched roof, with a clerestory over of coupled windows, of a bold lancet form. The church is built from designs of Blomfield, and finished inside and out with a sandstone taken from the site. The whole treatment of the design is of a very severe form of Early English, with a strong

French feeling infused throughout. Altogether this church is, to my mind, one of Blomfield's best, and is well worth careful study.

"Barrow," Quarry-road, St. Leonard's, is a large house lately built for the Rev. J. C. Tottenham, the proprietor of the St. Leonard's School. The building possesses all the characteristics of its architect, Norman Shaw, though it can scarcely be said to be one of his best works. The house is built of local sandstone on the ground-floor, the first floor being weather-tiled, and having boldly-projecting bays in half-timber work. The style is the Domestic form of Gothic which has been so successfully practised by Norman Shaw. The colour and grouping of the various parts are extremely effective. The swimming-baths, belonging to the before-mentioned school, lower down on the road, are, in my judgment, not to be commended. The Convalescent Home for Poor Children, at Bopeep, was only far enough advanced in construction to see they would be an effective group of buildings when finished. They are in red brick, with tile-hanging of a very quiet and domestic character, with a little half-timbered work here and there. The site is an extremely good one, and has been fairly taken advantage of. The Hertfordshire Convalescent Home, immediately adjoining, is an unpretentious group of buildings calling for no particular comment. The exterior has been rendered in cement, and some of the upper portions tile-hung. The architect is Mr. Thos. Chatfield Clarke. Returning from Bopeep towards Hastings, we come eventually to the Archway. This is a relic of the Old St. Leonard's Commissioners, and at one time marked the boundary between Hastings and St. Leonard's. This, together with the old assembly-rooms close by, is finished in cement, and a very severe form of Grecian Doric now happily discarded.

The district is anything but rich in old examples; but I would just mention a few which are within easy distance from the towns. Winchelsea, nine miles from Hastings—extremely interesting church and two old town-gates; Rye, three miles further on—church, grammar-school, town-gate, and one or two interesting pieces of domestic work in the town; Battle—eight miles, fine old abbey and church; Pevensey and Hurstmonceux Castles are both well worth visiting. Etchingam has a very fine church, not so well known as it should be. Space does not permit of my doing more than just naming these few examples.

A. H. T.

SANITARY ENGINEERING AND VENTILATION.

WE have received an illustrated and descriptive prospectus of sanitary and economic appliances prepared by the Sanitary Engineering and Ventilating Company, whose offices and exhibition rooms are at 115, Victoria-street, Westminster. As most readers know, this company was formed with the objects, 1st, of "furnishing the householder of London and the provinces with trustworthy advice on the subject of house-drainage, water supply, ventilation, and other sanitary matters, and the means for carrying out the necessary improvements in the most efficient manner; and 2nd, of providing the public with the most modern and approved appliances for ventilating apartments, for the storage and filtration of water, and for the exclusion of sewer-gas from dwellings, &c." Competent sanitary engineers are retained, also a large staff of specially-trained workmen. The scale of fees for sanitary inspection is certainly moderate, and within the reach of all householders. We find the fees vary from two guineas for houses of the annual rent of £50 within the London postal district, to six guineas for houses of the rental value of £600. Country inspections are made at the same rates, with the addition of the railway fare and expenses. After the report of the surveyor is furnished, the company undertake the work recommended, and they also make periodical examinations of the same to ensure perfect working.

Looking over the appliances, we notice an earthenware ventilator trap with a water seal of 3in., made in three sizes, namely, 4in., 7s. 6d., 6in., 12s. 6d., and 9in., 20s.; the siphon bend is rather deeper than required. A simple soil-pipe ventilator on the suction principle is shown, called the "Imperial," and an "improved stench-trap" in iron for surface drainage, with

a triple water-seal. The patent sewer-gas trap for lavatories and sinks we have seen and described before; the valve is a floating rubber bulb which is kept close up to the seat of ink-pipe by the pressure of water under. The section on ventilation in tubes several patent appliances, such as the "Imperial" ventilating tube for the admission of fresh air on the principle of vertical currents. The tubes have regulating valves, a horizontal inlet, wire grid, &c., and are made of triangular, rectangular, circular, and other sections of various sizes ft. high. The "Imperial" exhaust ventilators show the deflectors placed at various angles for producing the desired effect, and are made for gas-pipes, these varying in diameter to suit. Square forms for roofs are also illustrated. The company's system of ventilation is to admit air by the vertical tubes, either at the corners of room or elsewhere. The foul air escapes through openings near the ceiling, entering the smoke-flues or exhaust tubes. We notice an excellent contrivance for regulating the admission of fresh air to cabins of ships, a chimney exhaust for the cure of draught and of down-blows on a similar plan to the ventilator. The patent self-cleaning tank filter looks simple and effective, and some useful remarks are added on filtration and storage, and one or two portable filters are shown made of stoneware, in which a stratum of the filtering material is secured—one of the best we have seen. The sections on warming and lighting are illustrated by engravings of gas-stoves, and the "Imperial" slow-combustion grate, Griddle's ventilating register-stove with air-chamber behind, George's Chlorine stove; also of gas-meter governors, the "Albo-Carbon" light, billiard lights, &c. The catalogue will be found a useful addition to the architect's office, and the illustrations, sizes, and prices make it a generally acceptable guide to the public.

EXPANSION OF CEMENT AND CONCRETE.

OPINIONS of authorities differ much as to the behaviour of cement in setting. An examination of extensive concrete walls, such as those of the New Victoria Docks, discloses a number of vertical cracks, which seem to indicate that a contraction of the mass has taken place. From the experiments made by Messrs. Dyckerhoff, it would appear that expansion and not contraction had taken place. In Mr. Henry Fajja's little book, "Portland Cement for Users," which we lately noticed, two tables giving the results of experiments by Messrs. Dyckerhoff on a prism of cement of 10 centimetres in length and 5 centimetres square, lying in water, are introduced. These tests show the amount of expansion in 12 varieties of cement from one week to twelve months old. Mixed with three parts of sand, the expansion is much diminished, and for architectural works, the results need not cause any serious apprehensions. Mr. Fajja's remarks point to a possible contraction during the action of setting, which, however, is afterwards replaced by a slight expansion.

This expansion or contraction is not so great that architects or engineers may feel any distrust of the value of cement concrete. It is, in fact, so slight that in practice, as Mr. Fajja says, it may be disregarded, and we think it useful to quote the latter gentleman's observations on the experiments. "Ignoring, therefore, Messrs. Dyckerhoff's experiments (although they may have a theoretical value in practice, when laying any large piece, such as a courtyard or a length of roadway with a concrete paving, it is advisable to lay it in sections, separating each by thin wooden battens. These battens may be removed in a few days, or when the concrete is thoroughly set and hard, and then replaced up with a similar concrete to the already laid, by this means there will be no longer the apprehension of the work being spoiled by the shrinking of the concrete." For the walls of buildings this advice becomes of less importance, as the concrete is filled up in frames or panels, as we have more than once hinted. Besides which, the occurrence at intervals of doors and windows, &c., would relieve any large surface.

Where finished surfaces have to be made, Mr. Fajja deprecates the practice of putting a differently proportioned concrete as a finishing coat. It is nearly sure to crack or peel off. It is

preferable to make the concrete of a finer kind, and work the face up with a trowel or float. Thus treated, the surface may be made to have the appearance of rough-cast, or a smoother finish if desired. The crushing strength of concrete seems to have been repeatedly made the subject of experiment; yet architects and engineers, in applying the ordinary weights given in tables, seem to think that the same results ought to be reached in building everywhere, whereas those tests have only reference to a small cube of an inch each way. A one-inch cube of cement will bear a great deal more than a small pillar of it twice or three times the height and of the same base.

THE LONDON CARPENTERS AND JOINERS.

ON Wednesday night, at the "King's Head" Tavern, Ebury-bridge, Finsbury, a numerously-attended meeting of London operative carpenters and joiners (the fourth of a series to be held throughout the metropolis) was held, in response to the call of the committee of the United Societies of Carpenters and Joiners of London, "for the purpose of considering the present and future state of the trade, and likewise to discuss questions relative to combinations and benefits to be derived therefrom." The chair was occupied by Mr. James Orford, secretary of the Associated Carpenters and Joiners of Scotland. In his introductory address, the chairman reviewed the position of the associated trades at some length, and, in so doing, reverted to the problem as between labour and capital. This problem was easily solved, if but the right man in the right place, and at the proper time, took it up. Trade, he held, had its privileges, and, remembering these privileges, the responsibilities consequent thereon must not be lost sight of. As between capital and labour, the problem still unfortunately remained unsolved, though he would say the interests were identical. In view of these facts, the society points to its benefits, one of which is the security of the trade privileges which they had for so long enjoyed. With their system, not only would all unwarranted interference with their trade rates and privileges be denounced, but a powerful lever would be raised, not alone to improve their social condition, but by every means to raise the character of the trade, intellectually and morally as well. It was further shown during the proceedings that the present was not the time to stand idly by, while adhesion was demanded and the principles of the trade were at stake. Mr. Nightingale moved:—"That, owing to the majority of the men in our trade being non-unionists, and, owing also to the unity existing among the capitalists, the energies of the workers are exercised to their own benefit; but were every man in our trade to become a unionist, their social position would be improved, and the rights of honourable productive industry would not, as now, be usurped." Mr. W. Hepworth, secretary of the Organising Committee, seconded the motion, which was carried. Mr. Green and Mr. Eton, members of the combined trades, proposed and seconded the next motion:—"That, owing to the many evils existing in our trade, and the great disadvantages under which the workman labours, this meeting pledges itself to use its best endeavours to better our position by strengthening the ranks of unionism, believing that it would greatly improve our social and financial condition."

The blunders of our law-makers are as perplexing as the acuteness of the interpreters of the law. An English Act of Parliament recently declared solemnly that a new house was one which was pulled down or burnt down to within 10 ft. of the ground. In a burning case another court has decided that a "box" is not a "place." A man was arrested for mounting on a box at a race-course, and bellowing the odds and making bets, but the Court held that he had not infringed the law, though, if he had unfurled an umbrella over the box, that would have been a "place."

The tender of Mr. Garbutt, of Birmingham, being the lowest of six received, has been accepted at £1,631 by the local board of Brownhill, near Wolverhampton, for the erection of public offices. Mr. J. Siddalls is the architect.

St. John's Church, Southall, W., is about to be re-seated, under the direction of Mr. F. Shrewsbury, at a cost of about £300. Mr. Nye is the contractor.

Building Intelligence.

CARDIFF.—The Severn-road Schools, which are now in the course of erection for the Cardiff School Board, occupy a site fronting the Severn-road, and will accommodate 850 children. The buildings are being simply but substantially built, effect having been sought rather from a picturesque treatment than by any lavish display of ornament. Rubble-work masonry has been used for the walls; the large and small gables, cornices, chimneys, &c., are to be carried out in Bath-stone. Mr. Job Thomas, System-street, is the contractor for the works, which are to cost £6,523. The cost per head is £7 10s. nearly. The architect is Mr. J. P. Jones, 26, Park-street, Cardiff.

COCKINGTON.—A new reredos was unveiled for the first time in this parish-church last Sunday. It has been designed by Mr. James Hind, F.R.I.B.A., of Plymouth, and is in the Late Decorated style. It is made of oak; the lower parts are enriched by linen panels, surmounted by a projecting and richly-carved cornice. Above the altar-table the entire length of the reredos proper is formed, in the main, of seven continuous and connecting canopies. It is crowned by a foliated cross. From the lower junction of the various gables spring pinnacles, and loftier pinnacles of similar character are carried up from massive buttresses at either end. The recessed panel is of chestnut wood, and upon it is painted a representation of the Last Supper. This painting is by Mr. J. T. Pouracre, of Stonehouse, Plymouth. The new reredos has been made and carved by Mr. Harry Hems, of Exeter.

LANHYDROCK.—The rebuilding of the mansion of Lord Robartes at Lanhydrock, near Bodmin, is being prepared for by the contractor, Mr. Thomas Lang, of Liskeard. The house formed three sides of a quadrangle with a garden in the centre. The centre and the south wing were so much damaged by the fire that they are being entirely pulled down in order that they may be rebuilt. They will both of them be slightly widened. With this exception the house will be built on the old lines and in the same style—Tudor. But new buildings to a considerable extent are to be added on the south side, where there was always a large area between the out-buildings and the house. The floors will be supported by wrought-iron girders, and the ceilings of Dennett's patent. The walling-stone will be brought from a quarry at Margate, about three miles from the house, and the granite from Bolymen, in the parish of Lantivel. Three Cornish contractors were selected by the architect to tender for the work, and from them Mr. Lang was chosen. The estimated cost is not above £20,000. Mr. Richard Coad, of 3, Duke-street, Adelphi, is the architect; and Mr. Cooper, who has lately filled a similar position at Arundel Castle, the seat of the Duke of Norfolk, has been appointed clerk of the works.

ARCHITECTURAL & ARCHÆOLOGICAL SOCIETIES.

SOMERSETSHIRE ARCHÆOLOGICAL ASSOCIATION.—THE CLEVELAND MEETING.—At the evening meeting on Wednesday week, which was not commenced until a late hour, and a report of which we were, therefore, unable to publish last week, the Rev. H. G. Tomkins contributed some further information with regard to Worlebury Camp, near Weston-super-Mare. The Rev. Prebendary Seath read a paper entitled "A Brief Sketch of Parish History," relating more particularly to Wrington. Bishop Clifford complained that the programme was too lengthy, and did not allow sufficient time for the real and honest work of the society. Papers that would have occupied half an hour had to be got through in ten minutes in consequence of the long time occupied by the excursions, and discussion was also prevented. The meeting of the society was brought to a close on the 25th ult. The first place set down in the programme was Cadbury Camp, and the Rev. Prebendary Seath had promised to furnish the society with some particulars with regard to the ancient earthworks. In view of the long walk which a visit to the camp would entail, it was decided to omit that part of the programme; but the Rev. Prebendary Seath, at the request of

the members, consented to read his paper at the Public Hall before the start was made. A few particulars of Portbury Camp, another place intended to be visited, were also given by Preb. Searth. Soon after eleven o'clock about fifty members started on an excursion to Clapton-in-Gordano and Portbury. A visit was paid to Clapton-in-Gordano Court, the ancient family seat of the Claptons, who resided here from 1440 to the time of Charles the Second, 1615. Mr. E. Greene said the part of the house that was not inhabited was altogether new, but a small portion of it was evidently of the time of Edward II. It was built about the same time as Clevedon Court, in the middle of the 14th century, and there had been additions since. The tower was of the time of James, possibly late in Elizabeth's reign. An interesting feature was the screen, which was now to be seen outside the entrance door. It formerly divided the hall from the pantry, and it was the earliest wooden screen known in England. Consequently it possessed great interest. It was a valuable record, and seemed out of place in the position in which it was. There could be no doubt, although there had been so many additions, that it was a manor house of the time of Edward II. The "Two Ladies of Nash" had a kind of nunnery in Clapton, and here Bishop Ken used occasionally to come when tired of Longleat. Clapton-in-Gordano Church was also visited. The edifice is in course of extensive restoration, under the hands of Mr. Barnes, architect. It is an interesting-like structure, perched on an eminence. Its style is Early English, with Perpendicular additions. The party then drove to Portbury Priory, and Mr. Greene read a short account of the place, explaining that, when they last visited the priory, nothing was known about it. He could not even now give the date of the foundation, but, judging from the architecture, it was not very ancient. Not being a priory independent of itself, it was not noticed in the account of the chantries. This was a place for a few black monks, belonging to the monastery of Braemore, Hampshire. At the church some notes were given by the rector, Rev. E. O. Tyler. The leading features of this large edifice are the Norman doorway and Early English sedilia in the south aisle. This church, dedicated to St. Mary, was formerly appropriated to the abbey of St. Augustine, Bristol, and was granted to the bishopric of Bristol at the Dissolution. A few other places were visited, after which the party returned to Clevedon.

LEEDS ARCHITECTURAL SOCIETY.—On Saturday afternoon several members of the above society visited Huddersfield. Upon arrival they were met by Mr. W. Hoffman Wood, and the party afterwards inspected the principal buildings of the town, which include the Town-hall and Municipal buildings. They were kindly shown over the various departments in the Town-hall by Councillor Birley. The visitors next proceeded to the Borough Slaughter-houses, St. Peter's Parish-church and Schools, the new Theatre Royal, and several other buildings, and, after inspecting these, returned to Leeds, an enjoyable and instructive afternoon having been spent. The members of the society will visit York Minster next month under the guidance of Mr. George Bradley, the residential clerk of works.

ARCHAEOLOGICAL CONGRESSES.—The French Archaeological Congress was held this year at Vannes, where its forty-eighth session opened on June 28th and closed on July 3rd. Vannes is peculiarly well fitted as a place of meeting for a gathering of this sort, as its museum contains one of the most precious archaeological collections anywhere to be seen, and in its neighbourhood are to be found large numbers of megalithic monuments, the alignments of Carnac, grand menhirs and dolmens, the covered alleys of Gavrinis, with their enigmatical sculptures, and others. A large tumultus was opened before the members of the Congress on July 4th, near Vannes, and an excursion to Finisterre was planned after the meeting. The Congress was attended by French, English, Spanish, and Italian archaeologists. The Russian Archaeological Society held its last meeting at Tiflis, beginning on Aug. 20th, old style. The programme consists of the following divisions:—1. Prehistoric Antiquities; 2. Pagan and Classical Antiquities; 3. Christian Antiquities; 4. Mussulman Antiquities; 5. Art; 6. Monuments of Speech and Writing; 7. Linguistics;

8. Historical Geography and Ethnography. A temporary museum was organised for the exhibition of the antiquities discovered in recent years in various parts of the empire.

"To a practical man with a taste for mechanics, and the bumps of constructive fairly well developed, we can conceive no higher mental treat than a couple of hours spent over the June numbers of that truly marvellous publication the *English Mechanic*. In a hundred and fifty odd pages that make up the bulky mass of letterpress, there is recondite information on almost every conceivable subject, ranging from how to construct a mouse-trap, to the latest method of calculating the phases of Orion."—*The Brightonian*. Price Two pence of all newsmen, or post free 2½d.—31, Tavistock-street, Covent garden, W.C.

TO CORRESPONDENTS.

[We do not hold ourselves responsible for the opinions of our correspondents. The Editor respectfully requests that all communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondence.]

All letters should be addressed to the EDITOR, 31 TAVISTOCK-STREET, COVENT-GARDEN, W.C.

Cheques and Post-office Orders to be made payable to J. PASSMORE EDWARDS.

ADVERTISEMENT CHARGES.

The charge for advertisements is 6d. per line of eight words (the first line counting as two). No advertisement inserted for less than half-a-crown. Special terms for series of more than six insertions can be ascertained on application to the Publisher.

Front Page Advertisements 2s. per line, and Paragraph Advertisements 1s. per line. No front page or paragraph advertisement inserted for less than 5s.

SITUATIONS.

The charge for advertisements for "Situations Wanted" is ONE SHILLING for TWENTY WORDS, and SIXPENCE for every eight words after. All Situation advertisements must be prepaid.

Advertisements for the current week must reach the office not later than 5 p.m. on Thursday. Front page advertisements and alterations in serial advertisements must reach the office by Tuesday to secure insertion.

TERMS OF SUBSCRIPTIONS.

(Payable in Advance.)

Including two half-yearly double numbers, One Pound per annum (post free) for any part of the United Kingdom; for the United States, £1 6s. 6d. (or 6dols. 40c. gold). To France or Belgium, £1 8s. 6d. (or 8frs. 30c.). To India (via Brindisi), £1 10s. 6d. To any of the Australian Colonies or New Zealand, to the Cape, the West Indies, Canada, Nova Scotia, or Natal, £1 6s. 6d.

Cases for binding the half-yearly volumes, 2s. each.

NOTICE.

Now Ready.

Vol. XL. Price 12s. A few bound volumes of Vol. XXXIX. may still be had, price Twelve Shillings; all the other volumes are out of print. Most of the back numbers of former volumes are, however, to be had. Subscribers requiring any back numbers to complete vol. just ended should order at once, as many of them soon run out of print.

RECEIVED.—B. and P.—M. and Co.—F. W. R. and Co.—W. L.—E. H. S.—J. S.—N. E. R. Co.

JOHN BLAKEY. (We do not know the limit as to age; but the Secretary of the R.I.B.A. could, doubtless, inform you.)—**STURGES.** (Banister Fletcher's books. See Batsford's advertisement.)—**A SLIP.** (If the advertiser who inclosed a remittance and an advertisement *without name or address* in a registered envelope bearing the postmark "Workshop," will communicate with the publisher, his instructions shall be attended to.)

Correspondence.

COOPER'S HILL v. THE ROYAL ENGINEERS.

To the Editor of the BUILDING NEWS.

SIR,—I am quite in accord with "Peter Playfair" in giving the palm to the Royal Engineers over most of the so-called Civil Engineers who are associated with them on the public works of India. It needs very little discernment to arrive at that conclusion, as the Royal Engineers are the picked men of their school, and their elementary training is good. It is for their want of practical knowledge of works that the Indian public have cause of complaint.

Notwithstanding this, I have no doubt they are more to be relied on than many of the so-called Civil Engineers who are associated with them, for the reason that the education of the latter has not been so good, nor their experience more extensive. These are not the kind of engineers required in India, but thoroughly trained, practical men, experienced in the conduct of large works before their arrival in that country, which is too poor to admit of its being used as a training-ground for any profession where a large and useless expenditure is

the consequence. What I wished to lay stress upon in my letter was the Royal Engineers expecting to escape their responsibility by throwing the blame on subordinates, be they called Civil Engineers or Supervisors of Works.

In describing the state of the public works of India generally, my language may have been somewhat hyperbolic—at least, I should hope that it was so; but, if the truth of the cases I have cited be admitted (and they were not disputed at the time they were said to have occurred), I cannot conceive anything more deplorable.—I am, &c.,

27th August.

JAALAM SMITH.

PRACTICAL NOTES ON PLUMBING.

SIR,—Mr. J. P. Davies has been doing good service for some time past by publishing in your columns his "Practical Notes on Plumbing," and I for one thank him very much for them.

I am afraid, however, that upon the question of general construction, upon which Mr. D. entered last week, I shall not agree with him. I certainly cannot agree with his arrangement of waste pipes, to which he refers on p. 278. In my opinion it is most objectionable from the fact that it is liable at any time to become a means by which sewer-gas can escape without interruption into the house, and is at all times the cause of a more or less offensive smell in the rooms.

The wastes should be disconnected outside the wall and again at foot, so as to run into, but not directly over, the surface gully.—I am, &c.,

DANIEL EMPTAGE, S.E.

Danehill Sanitary Works, Margate, Aug. 29.

MR. DAVIES AND HIS U-TRAP.

SIR,—I have read Mr. Emptage's letter on Mr. J. P. Davies' experiments with the U-trap, at the Plumbers' Discussion on Mr. Hellyer's lectures. I have only to say that I am sorry I was not there; but from what I heard from some who were, I availed myself of the opportunity of paying Mr. Davies a visit at his establishment, for the purpose of convincing myself of the merits of Mr. Davies' U-trap, and, from the test I put the same trap to, I have no hesitation in saying that it is the most perfect U-trap in practical operation, and I emphatically deny that the same trap takes more than a pint of water to clear away a handful of stones, or a piece of house-flannel. Now, this was done without the use of the plug in the container, in my presence, and any gentleman in the profession is at liberty to call at Mr. Davies' office and prove it for themselves.—I am, &c.,

GEO. COURT.

41, Leipsie-road, Cumberwell, S.E.

SIR,—I have seen Mr. Emptage's letter on page 281, and think he has a somewhat peculiar conception about the construction of my model U-trap—to wit, that I have failed altogether, &c. He says I used 1½ gallons of water to clear the pebbles, &c. out of this model on the 15th inst., at the Society of Arts room. If he had kept his eyes upon the outgo of the trap when the experiments were made, he would have seen the pebbles, &c. pop out of the trap with the first half-pint of water. However, there is one point in his own letter which, after my reply, will prove that this model was, and is most unquestionably the best form of sink-trap yet invented. I take the third paragraph of his own letter, which runs as follows:—"Had Mr. Davies taken the plug out of his tank and thrown in two pints only of water, the test would have been a fair comparison to an ordinary w.c. flush." I take these, his own words, and make them my trump card. And, further, as a strong supporting pillar of proof, bring in one of Mr. Hellyer's best foremen of plumbers, a gentleman well known throughout the plumbing circle, Mr. Gutridge, to testify that he has been sent to my office by Mr. Hellyer to see my trap in action, and that I have in his presence (and hundreds also), placed a handful of pebbles, rag, &c., into the body of this small or half-sized trap, and with only one pint of water cleared them out.

After this, I respectfully ask Mr. Emptage to acknowledge that he has been mistaken, and that my model will answer what I claimed—more especially as he so kindly gave me two pints instead of one to work with.

I am now in a position to prove that this trap

possesses five advantages over all others I have seen.

Firstly: It holds less water or sewage-matter than any other full-sized closet-trap known.

Secondly: The soil will pass more readily from the dip to the body of the trap with less water than any other make.

Thirdly: That the siphon-action is less than in any other kind of trap.

Fourthly: It cannot clog out.

Fifthly: Anyone can make it at a small cost.

I suppose this will also have some weight with my old friend H. B., who has not fully seen the merits of this model. I may mention that this gentleman has had many paper fights with me, and if he is at last convinced about the matter, I shall be pleased to know it; but, if not, I invite him or anyone else to make an appointment to come to my office, 2, Shaftesbury-terrace, Warwick-road, Kensington, W., and see the thing in action. I am generally at the above address Saturday afternoons, so that working plumbers may come. I am, &c.,

P. J. DAVIES, C.E.

VENTILATION OF SOIL-PIPES.

SIR.—Mr. Imptage's letter does not indisputably prove his case. He first states that to him it appears "rather strange that anyone should compare a simple water-siphon with the siphon-trap of a w.c.," and then proceeds to indicate the points of difference which, according to his account, are comprised in the *greater* length of the long leg of a w.c. siphon, and in the *large* volume of water rushing through. There can be no siphonic action without a vacuum, and a vacuum is impossible if the siphon-pipe is punctured, therefore the *length* of a long leg of siphon is immaterial. Mr. E. attributes great import to the *large* volume of water which, as he says, "rushes through" a w.c. siphon. The force which sends this water rushing through is not a siphonic or gently-drawing force, but an impulsive driving-action caused by the weight and fall of the water. As the trap is always fixed closely adjacent to the basin, it is difficult to conceive the possibility of any flash of such an impelling nature that it should run itself out of the trap-hollow. Mr. Hellyer proved by ocular demonstration that a trap having an apex orifice could not be a siphon. In the very improbable case of a volume of water forcing itself through the trap as to destroy the efficacy of the water-seal, the operation could only be of a very temporary character. The tail-end of the water volume would suffice almost immediately to fill up the deficiency. The "rushing force" of the water would clear the soil-pipe of sewer gases, driving them irresistibly up the escape-pipe of the apex orifice, and consequently "little or no harm" would be done in case of such a momentary unsealing of the trap; but without the apex orifice such an operation, momentary or otherwise, would be fraught with the most direful danger. I am, &c.,

MEADWELL DREW.

London, Aug. 29, 1881.

UNTRAPPED GULLY-HOLES.

SIR.—The letter from "C. F. M." on page 282, demands attention, especially if it can be certified as correct that the breathing of the sewer-air from the gully-hole really caused two persons to be taken ill with typhoid fever, one of whom died. We may, I suppose, take it as a matter of course that it was not the bad air itself that produced typhoid, but the contagion of the typhoid conveyed in the soil-sewer-air.

I have never been in favour of the sewer being ventilated by the gullies at the side of the pavement, but rather supported the idea of the ventilating openings for the sewer, at the street-level, being in the centre of the street.

I have often been distressed myself when walking at the edge of the pavement to feel the stink rising out of the untrapped gully in the gutter, and therefore to support the plan which traps these and makes the openings in the centre of the street. I am, &c.,

W. P. BISHAM, S.E.

Glasgow, 29th Aug.

BUILDING-STONES.

SIR, I have refrained from taking part in the correspondence so ably conducted on this subject for some weeks past in your widely-read columns. It seems, however, incomplete

without the information asked for by Mr. Philip E. Masey, in your issue of July 22, with respect to the Bath stone used in the construction of the Grosvenor Hotel, affording, as he well says, a good example for London, where the atmospheric influences are much more deleterious than elsewhere. This stone is an excellent specimen of the Bath Oolite, and shows a fine and uniform grain, from being deposited in the geological formation under favourable conditions and great pressure. It may be described as a calcareous sand-stone, with a small percentage of silica, and is therefore a free-working stone, and well adapted for ornamental purposes where fine moulding and carving are required.

Mr. Masey inquires: From what quarry did this stone come, and could more of the same be procured with certainty as to like durability? As none of your correspondents have furnished the information, I beg to say the stone was supplied by the enterprising firm of Randell and Saunders, from the Corsham-Down Quarry, situated near the east mouth of the Box Tunnel on the line of the G. W. Railway, of which, at the period referred to, they were the lessees, but which since the year 1871 has been worked by the present owner, to whom the property reverted at the death of the late proprietor of the estate. The property, although not an extensive one, is capable of yielding, as at present, a large output of the same quality of stone for many years to come. In regard to the strength of this stone for resistance under pressure, its capacity for carrying weight has been ascertained, by carefully conducted hydraulic test, to be equal to over 70 tons to the square foot, cracking slightly at 75.1 tons and crushing under a pressure of 102.8 tons.—I am, &c.,

AUGUSTUS YOCKNEY,

Present owner of the Corsham Down Quarry, Corsham, Wilts, Aug. 29.

DESTRUCTION OF THE LANTERN TOWER AT THE CHURCH OF ST. CUTHBERTA, WIMBORNE MINSTER, DORSET.

SIR.—Since the appearance of my letter, dated August 16th, in your columns respecting the above, I have received a letter from the architect informing me that where brown stone was taken away, it was replaced by that of the same colour, also that no Bath-stone is being used in the repairs.

I must admit that I was misled by the appearance of the western side of the tower, which presents a totally different appearance to the rest, being chiefly composed of white stone, which appears to have been restored at some subsequent period, probably when the spire fell down in 1600. Both the architect and a correspondent in last week's *Bournemouth Directory*, who signs himself "One of the Building Committee," seems to lay great stress on my assuming that Bath-stone was used. I care not what white stone is being used, but I question very much if any white stone should be used. What I object to, in fact the object of my letter, was to point out what a patchwork look the white stone has with the brown, destroying that charm the tower presented a few weeks ago.

The architect also demands an apology from me, for assumed vandalism. This I should object to give, because I think a great deal of vandalism is going on in this so-called restoration. But not to trespass too much on your valuable space, I may mention one thing: Just above the springing of the arches of the arcade, occur carved heads, in brown stone. Where these have perished, they have been replaced with a lump of cement, on the front of which is formed a face. This fact speaks for itself.

I must ask the person who signs himself "One of the Building Committee," not to quote the name of Mr. Ewan Christian, because he told me he had nothing to do with the restoration of the tower; he only reported on its condition.—I am, &c.,

MILLS ROBINS.

August 31st, Feast of St. Cuthberta.

P.S.—I may mention in my first letter I signed myself "Hon. Secretary of the Bournemouth Field Club," but I wish to say it was in no way connected with the Club, the letter being entirely my own.

OLDSWINFORD HOSPITAL-SCHOOL COMPETITION.

SIR,—Will you permit me, through the medium of your valuable journal, to ask any of

your readers to publish the results of the School Competition for the Oldswinford Hospital, Stourbridge, which was advertised in the professional papers a few months since, and oblige?—I am, &c.,
August 30th.
ARCHITECTUS.

THE ARCHITECTURAL ASSOCIATION AT WORCESTER—CORRECTIONS.

SIR.—In your report of the Architectural Association at Worcester, it is stated that Kington Church is as yet unrestored, and that Crowle Church was restored not long ago by Mr. Preedy. Kindly allow me to state that the former very quaint little church is at present being restored by Mr. W. J. Hopkins; and the latter is in course of rebuilding from the designs of Mr. Preedy. The foundation-stone was laid about three weeks ago.

The wings of the Worcester Guildhall, instead of being entirely rebuilt (as ought to have been the case), the front walls only are rebuilt: and it is much to be regretted that in consequence of the alterations suggested by the local authorities, they are not rebuilt as shown in Mr. Niven's very excellent drawing.

It is said that the architect (Thomas White) was the sculptor of the trophy of arms in the large tympanum. Whether or not such was the case I am not quite sure; but the initials and date, "T. W., 1722," are still to be seen cut in the stonework of the tympanum.—I am, &c.,

LEWIS SHEPPARD.

San-one-walk, Worcester, August 30th.

Intercommunication.

QUESTIONS.

[669.]—**Fumigating Oak.**—Will any reader state how this is done, and what chemical used?—G. S.

[6610.]—**Wood-Carving.**—Enquirer wishes to commence wood-carving. Will some of your readers give a few hints as to the best way to set about it, and what tools will be required, &c.?—Z. D.

[6641.]—**R.I.B.A. Preliminary Exam.**—Would a correspondent advise me what course of study I should pursue in preparing for the R.I.B.A. preliminary exam? Where could I obtain the necessary particulars?—NORTH-EAST STUDENT.

[6612.]—**Work Expected from Ex Pupils.**—What is a young man, just finished pupillage or apprenticeship expected to know—that is, the next office he goes to, what is he expected to know, and what work has he to do, and what wages might he expect? Also, is there much difference between a Scotch and English office.—SCOTCH YOUNGSTER.

[6643.]—**Land Agent.**—Will some kind reader be good enough to give me the name of a cheap and useful book for a young land agent?—ANXIOUS.

[6614.]—**Powers of Urban Sanitary Authorities.**—Will any of your numerous correspondents kindly answer the following question:—Has any urban sanitary authority power to prevent any one from erecting a balcony and bay window over the footpath? The proposed balcony, which is 12ft. from the ground, would overhang the footpath 2ft. 6in., and the bay window which comes over the balcony would project 1ft. 6in. from the face of the building. The proposed balcony would project about 13in. beyond the cornice of shop below. Has any case been tried on this point?—D. H. V. T.

[6645.]—**Iron in Structures.**—I shall feel obliged by one of your correspondents kindly giving an opinion as to what is the proper designation of the artificers who bed, fix, or set up ironwork in structures where no smithing is required?—FRANCO.

REPLIES.

[6611.]—**Measuring.**—Use the hypsometer, made by Geo. Prescott and Co. (Limited), of Dublin. You hold the instrument in your hand and walk away from the object whose height is to be measured, till looking through the plain sights you see the top; then the distance from yourself to the foot of the object added to the height of your eye, will give you the object's height.—W. F.

[6611.]—**Measuring.**—Absolute accuracy may not be obtained by the following methods, but they may be sufficiently near for "C. F. M.'s" purpose. I give them because they are simpler than some of the plans suggested, and more accurate than others. If the space in front of the object equals the height of the object, take a set-square (a large one made of laths or otherwise, but the larger the better, with angle of 45°) set it so that when the square sides are plumb and level, the other side shall incline to the top of the object. See Fig. 1. Then the distance from C to D = height D to A. Add the height below D to ground I, at B, and the sum is the total height. Carefully performed the above will give the height correctly, as all the measurements are dealt with full size. If the space at base of object will not permit of the above method, the following may be adopted. See Fig. 2. Let A B be the object. In any convenient position set up a short pole E C, and a short distance between it and the object a longer one F G. Apply the eye at C, and mark where a line from A would cut F G, viz., at K. Mark also where a level line would cut F G and the

object, viz., in H and D respectively. Then the triangles CHK and CDA are similar, and their respective sides are proportional to each other. Measure the lines CH, HK, and CD; suppose them to be 3ft., 4ft., and 5ft. respectively, then by a question in the rule of three, as 3:50 :: 4 to the height DA, or 66' 8". Add the height from D to B, and the total is the height of the object. By this method the poles EC and FG must be set up perfectly plumb, and the measurements upon and between them very carefully taken, and the farther apart they are and the farther from the object, the less chance of error.

If the object tapers, say, a steeple, it will be understood that the line CD must be measured to the centre of tower, which can be done by adding half width of base to the distance from outside of wall to C. A good few years (eight or ten, or more, perhaps) ago there was described, in the *Building News*, a small instrument for measuring such altitudes, but I am unable to lay my hand on the place just now. The instrument could be carried in the vest pocket.—L. L. U.

[The instrument referred to was the Apomecometer, invented by Mr. R. C. Millar, of Dublin, and illustrated and described in the *B. N.* of Feb. 26 and March 5, 1869.—Ed.]

[6811.]—**Measuring.**—To obtain the measurement of an inaccessible height, take a station point at some convenient distance from object to be measured. At a distance of, say, 5ft. from station point, in a straight line with object, erect a perpendicular. From station point

sight a line to the top of object, and note where it cuts the perpendicular. In sketch it is 4' 0" from the ground. The height of the object = $\frac{4}{5} \times 25\text{ft.} = 20\text{ft.}$ In practice it is somewhat difficult to erect a rod truly perpendicular.

The best plan is to have a right angled triangle made of straight edges, and to shift it until the top of object coincides with the line of the hypotenuse. To obviate the inconvenience of grovelling on the ground to obtain the sight-line, the triangle could be stilted to the height of the eye as shown by the dotted lines on sketch. In this case the height = $(\frac{4}{5} \times 25) + 5\text{ft.} = 25\text{ft.}$ —

QC19.

[6612.]—**Laying Large Concrete Blocks.**—“J. K.” will find a full account of the method of laying down the big concrete blocks, will full descriptions and drawings of the machinery, in Mr. Stoner’s paper in the minutes of *Transactions* of the Institute of Civil Engineers, Vol. 37, page 332.—W. F.

[6822.]—**Building Construction.**—If “F. P.” resides in Edinburgh, surely a little inquiry would bring him the information he seeks. A friend of mine attended classes under the Science and Art Department in Watt’s Institution, and, doubtless, there are many others.—L. L. U.

[6933.]—**Curves in Perspective.**—Find points in the line of curve according to rule. Sketch in pencil freehand, and use French curves for “finishing” the lines, or for inking.—L. L. U.

[6635.]—**Architect’s and Valuer’s Licence.**—Being in doubt upon this point, I wrote, a few weeks since, to the Secretary of Inland Revenue at Somerset House, stating that I was frequently called upon to measure and value artificer’s work, and for my safe guidance I was anxious to know if it was necessary for me to have a valuer’s licence, and his reply to me was that “to enable me legally to measure and value work I required an appraiser’s licence,” also to the effect that stamps are needed on the valuation or award. It appears to me that this is an important point, and one that cannot be made too public, for I am sure there are many who are inadvertently acting without a licence or using stamps. It also appears to me that if an architect values a builder’s work he is equally liable, and if a dispute arose upon his award and it was produced in a court of justice not being stamped, the document would not be accepted as evidence, and then would crop up the question, Had the valuer a licence? with sundry unpleasant consequences to follow. I also learned from the same source that if a valuation is

arrived at from a schedule of prices previously agreed upon, then a licence is not required.—W.

[6636.]—**Books on Construction.**—Replying to “Architectural Pupil,” perhaps the following list of books on above will be useful to him:—“Notes on Building Construction,” to meet the requirements of the syllabus of the Science and Art Department of the Council on Education, South Kensington, 3 vols., 8vo., cloth, £1 15s. Vol. I., First Stage, 219 pp., and 325 woodcuts, 8s. 9d. Vol. II., Second Stage, 227 pp., and 277 woodcuts, 8s. 9d. Vol. III., Materials, 53 pp., and 181 woodcuts, 17s. 6d. “The New Guide to Carpentry,” General Framing and Joinery, Theoretical and Practical, edited by R. Scott Burn, architect, illustrated by 150 plates and 538 woodcuts, £1 15s. “The Architectural Sketch-Book,” edited by the Portfolio Club, with plates. There are several works published on Gothic architecture. Among them are: “The Gothic Model Book,” or the Architecture of the Middle Ages, with its associated arts, and contains 216 fine plates, some of stained glass, coloured small folio, half morocco, 32s. “The Principles of Gothic Ecclesiastical Architecture,” by Bloxham, 6s. 6d. The above books may be obtained from Mr. B. T. Batsford, 52, High Holborn. Send for his catalogue.—FRED. J. FREEMAN.

PARLIAMENTARY NOTES.

POLLUTION OF THE THAMES.—Mr. Causton last week asked the President of the Local Government Board, in reference to the statement contained in the report of the Conservators of the River Thames, “that Kingston and Richmond, and other places below the intakes of the water companies, still pass their sewage into the river,” whether any, and, if any, what steps were being taken to remedy the evil. Mr. Dodson.—The House is aware that in 1878 a joint Board was formed, known as the Lower Thames Valley Main Sewerage Board, for the purpose of providing for the disposal of the sewage of these as well as other places, and in 1879 they brought in a Bill for this purpose, which was unfortunately thrown out on second reading. Last year they proposed another scheme, which after a long inquiry the Local Government Board were unable to approve, and the joint Board have recently proposed another scheme for consideration.

LEGAL INTELLIGENCE.

LIBEL ON AN ENGINEER.—At the Liverpool Police Court on Saturday, Mr. Harold Furniss, the printer and publisher of a weekly paper called the *Wasp*, was summoned for libelling Mr. G. F. Lyster, engineer to the Mersey Docks and Harbour Board. The libel consisted of an implied assertion in the “notices to correspondents,” that Mr. Lyster had received commission from the manufacturers of cement used in the dock works. Mr. Lyster was called, and he denied that there was any truth in the insinuation. On behalf of the defendant a complete apology was offered, it being stated that he had now practically no connection with the paper, and that at the time of the appearance of the libel he was out of town and knew nothing about it. Mr. Lyster accepted the apology and the case was withdrawn, no order being made as to costs.

IN RE G. CRABB.—At the London Bankruptcy Court on Saturday, an application was made to Mr. Registrar Brougham, sitting as chief Judge, for the appointment of a receiver and manager of the estate of George Crabb, builder, of the Phoenix Works, Kingland-green, London. The petition was presented yesterday, the liabilities being stated at £53,800. The assets are valued at £46,000, and consists of stock and plant, also the amounts due under certain contracts.—Upon the application of Mr. Doria, supported by creditors for £24,000, his Honour appointed Mr. Child (Boyes and Child) receiver of the estate, but declined to appoint him manager in the absence of evidence that the creditors supporting were all unsecured.

ST. JAMES’S, PADDOINGTON.—(Before Dr. Tristram, Q.C., Chancellor of London.)—This was a renewed application on Friday last, for a faculty by the vicar and churchwardens of St. James’s Church, Westbourne-terrace, to reconstruct the body of the building in accordance with the plans of Mr. Street, the architect, at an expense of about £15,000, which has been subscribed or promised.—Mr. Smith, one of the Masters of the High Court, and other parishioners, opposed; and the case, which had been before the Court on a former day, was now concluded after a sitting of more than five hours.—Mr. Gainsford Bruce was for the faculty, and Mr. Blakesley opposed.—The question was raised whether the body of the church should be reconstructed or merely repaired, and externally decorated. It appeared that Lord Justice Cotton, Dr. Deane, Q.C., and others had liberally contributed, and the principal point was “reconstruction.”—Mr. Austin Leigh, a member of the Bar, and of the firm of Messrs. Spottiswoode, who had acted as one of the treasurers, said there was £8,000 in hand, and he had no doubt that the subscriptions would amount to £15,000. When the proposal was made Mr. Smith and other parishioners objected, and it was then thought that the expenses would exceed £20,000. That gentleman said he

had no scheme to propose, but he had strongly objected to the scheme on which the vicar, the Rev. Walter Abbott, had “set his heart.” Mr. Smith gave his view of the matter, and an application was made to postpone the case for material evidence. It was proposed to call scientific evidence (Mr. Christian, the architect to the Ecclesiastical Commissioners, being mentioned) to show that the proposed scheme was not necessary, and objections had been made. Several witnesses were called, and it was stated that if the alterations were commenced during the present vacation, the church need be closed only for a week or two, and next year from July to November. Recently the feuders had been opened, and they were all under £15,000, so that the expenses would be for the improvements under the sum subscribed. A material question arose as to the diminution in the sittings which would take place in the plans filed; but Mr. Street said he could make such alterations and galleries as would come up nearly to the original number of sittings. Dr. Tristram, after a long investigation, was in favour of the petition, except in the diminution of the sittings, which Mr. Street said could be replaced by additions to be made. He held that there must be a supplemental petition and citation, and if no appearance in a week the faculty would be issued. He knew that he could appeal; but he put it to Mr. Smith whether, after all that had been stated, it was reasonable to delay the proposed reconstruction. The learned Chancellor allowed Mr. Smith the costs on the point he had established.

ACQUITTAL OF A BUILDER.—The adjourned August Sessions for criminal business were held on Wednesday at the Sessions-house, Clerkenwell, before Mr. P. H. Edlin, Q.C., the Assistant-Judge, Mr. J. D. Fletcher, Chairman of the Second Court, and Captain Morley. Thomas Watkin Smith was indicted for stealing stone to the value of £1 ls., the property of Messrs. Aspinall and Son. Mr. Dr. J. Lewis prosecuted, and Mr. Burnie defended the prisoner. It appeared that for the past 12 months the prisoner, who is a builder, had been in the habit of buying stone of the prosecutors, who have a wharf close to the East-end, Finchley-road, Railway Station. On the 26th of July he was seen close to the wharf by William Powell, the prosecutor’s foreman. He did not then say that he wanted any stone, but the foreman afterwards discovered that three pieces, value £1 ls., had been taken from the wharf by a carman named Dodd, acting under the prisoner’s instructions. Powell went to the prisoner’s house and made inquiries about the stone. The prisoner at once admitted that he had it, and said he meant to pay for it. For the defence it was contended that the prisoner, finding himself suddenly in want of stone, had, in the absence of the foreman, caused it to be taken to his place, meaning to pay for it afterwards. Witnesses were called who gave him an excellent character for several years past. The jury at first could not agree, but after having retired for about an hour, they returned into Court and found the prisoner “Not Guilty.”

SCULPTORS AND TITHES.—The tithe question, which is pressing hardly upon some of the farmers, has been raised in the Midlands by Mr. John Roddis, of Aston. The present vicar, the Rev. W. Eliot, in October last, instructed his solicitors, Messrs. Rowley and Chatwin, of 11, Temple-row, Birmingham, to make application for the payment of the tithe due for the year then passed, and amongst others to whom such application was made was Mr. John Roddis, sculptor, of Aston-road, whose studio is erected on land belonging to the Rev. F. Smith, vicar of St. Mary’s Church, Aston Brook. The amount demanded of Mr. Roddis was £1 6s. 4d., but he declined, on conscientious grounds, to pay the money, and wrote to the vicar to that effect. Matters went on until about three months ago, when another demand was made for the tithe, and this not being heeded, the Rev. W. Eliot, a fortnight ago, caused a notice to be served on Mr. Roddis, informing him that unless the tithe was paid within ten days, together with 2s. 6d., the cost of the notice, he should distrain “upon the land and premises in his occupation, and dispose of the distrain when taken.” This notice expired on Thursday last, and as Mr. Roddis still refused to pay the charge, instructions were given to a local firm of auctioneers to make a distrain on his goods. Accordingly, at eight o’clock on Wednesday morning, the auctioneers, attended by a couple of bailiffs, drove in a furniture van to Mr. Roddis’s studio for the purpose of making the seizure. Before commencing proceedings they made a formal demand for the money—viz., £1 6s. 4d. the tithe charge, 2s. 6d. the cost of the notice, and 5s. 6d. the expenses connected with the levy, in all £1 14s. 4d. Mr. Roddis was not in at the time, but a messenger was sent for him, and upon his arrival he declared his refusal to pay the money, and said the bailiffs might make the levy. Before his arrival a large crowd had assembled in the immediate vicinity of the premises, and they were extremely demonstrative in manifesting their disapproval of the proceedings. Mr. Roddis cautioned

the officers against removing any valuable carvings which would be likely to sustain damage in transit to the sale-rooms, and they intimated that rather than run such a risk they would seize some rough stone, of which there was a considerable quantity. In the yard were some blocks of marble which had not been worked, and having been shown the invoice of their cost, the officers elected to take these. The crowd, however, pressed round the van in such numbers that the bailiffs found it impossible to carry out their object unaided; and as none of those present would lend a helping hand, nothing remained but for a bailiff to be left in charge whilst the others went for assistance. The crowd gradually dispersed, but some of them watched for the return of the augmented staff of officers and when they put in an appearance in the afternoon the people flocked to the place in even greater numbers than before. This time four other bailiffs were brought, making six in all, and they were enabled, after some little jostling, to place the blocks of marble, three in number, in the van. The crowd were very noisy; but Mr. Kelly, Mr. Roddis's manager, appealed to them not to interfere with the officials, and eventually they allowed the bailiffs to drive the van away. Before dispersing the crowd gave three cheers for Mr. Roddis, and groans for the Vicar. One man, who was carried away by the excite as to use threats to the bailiffs, and to be otherwise violent in his conduct, was taken into custody by the police. Notices were served on a number of persons informing them that a distraint would be levied on their goods unless the title was paid in ten days' time; but, so far, no attempt has been made to put the notice into effect.

WATER SUPPLY AND SANITARY MATTERS.

THE POLLUTION OF THE LOWER THAMES.—Mr. C. Wilson, Cheltenham, writes to the *Times*, making some brief suggestions towards the more satisfactory disposal of the drainage of London. He says:—"The first essential element would seem to be the separation of the storm-waters from the house-drainage, the former being discharged as soon as convenient into the Thames. Considering the tidal and other currents, such discharge could not become a nuisance; but wherever solid matter is discharged into the river, as at present or as hereby proposed, dredging may be requisite. If the solid matter were strained from the house-drainage, as it now is from the sewage at the Abbey Mills pumping station, the fluid portion could be lifted at intervals, by steam-power, to such levels as to reach land suitable for irrigation. It is found profitable to raise the present diluted sewage 30ft. to enrich the farm near Barking. The house-drainage alone, being of a more enriching character and more uniform in quantity, could probably be raised with profit to the height required to command suitable soil. If the cost were too great, London can well afford to supplement the outlay. It should be borne in mind that sewage irrigation affords double profit on a sandy or gravelly soil as compared with a clay soil. The present method of disposal of the London sewage is not only wasteful of enriching matter, but a foul blot on our civilisation. If the drainage of towns were properly utilised we need not import nearly so much meat and other produce as we are now doing. We thus submit to a great loss and permit an intolerable nuisance."

STATUES, MEMORIALS, &c.

BURSLIM.—On Wednesday week a new drinking-fountain was uncovered at Burslem. The fountain, which has been erected at the cost of the mayor (Mr. J. Maddock), is placed on three tiers of Kerridge stone. The height of the structure is 16ft. from the ground and 11ft. 6in. from the top of the three tiers of stone. The apex consists of a globular gas-lamp, and is supported by a fluted column, at the base of which are two dolphins entwined. Below this is a canopy 5ft. 6in. square, supported by four pillars with foliage capitals. The structure has been supplied by the Coalbrookdale Iron Company, and has been erected under the superintendence of Mr. Worth, the borough surveyor.

MEMORIAL OF THE LATE MR. ROEBUCK.—Shortly after Mr. Roebuck's death in 1879 a committee was formed of his principal friends in Sheffield to raise funds for the erection of a memorial to the right hon. gentleman. It was decided to erect a monument over his grave in Rushy Churchyard, North Ebbw, and to subscribe for a marble bust, to be placed in the Cutlers' Hall, at Sheffield. The presentation of the bust to the Cutlers' Company took place on Tuesday. The bust is the work of Mr. W. Ellis, a local sculptor.

Our Office Table.

We have received from the Science and Art Department the following list of candidates who have been successful in obtaining Royal Exhibitions of £50 per annum each for three years, and free admission to the Course of Instruction at the following Institutions:—(1) The Normal School of Science and Royal School of Mines, South Kensington and Jernyn-street, London. Thomas Mather, 21, pattern-maker, Manchester; Alfred Sutton, 21, engine-fitter, Brighton; William H. Littleton, 17, student, Bristol. (2) The Royal College of Science, Dublin. Arthur Whitwell, 19, ex-pupil teacher, Nottingham; Frederick J. Willis, 18, student, Bristol; Christopher J. Whittaker, 21, pattern-maker, Accrington.

The construction of another great Alpine tunnel, which should bring Paris and the north of France into more direct communication with Italy than is afforded by the existing tunnel through Mont Cenis, is under consideration with the French Government, the projects including not only one through Mont Blanc, but also through the Simplon or the Great St. Bernard. The tunnel under the Simplon would be 60,719ft. long, while that under Mont Blanc is only 41,292ft. As compared with other Alpine tunnels, Mont Cenis is 40,093ft., and St. Gothard 18,952ft. The Simplon would, therefore, be longest of all; but, on the other hand, it would be on a lower level than the others, the entrance at Brieg being only 2,333ft., and that at Iselle 2,253ft. above the sea-level. The entrance to Mont Blanc tunnel would be 3,345ft. at Montquart and 4,215ft. at Entrèves above the sea-level. The Bardonnèche entrance to Mont Cenis is 3,970ft., and that at Modane 3,799ft., while in the case of the St. Gothard tunnel the northern entrance at Goeschenen is 3,638ft., and the southern, at Airolo, 3,756ft. above the sea. Thus the Mont Cenis tunnel is shorter, but 330ft. higher, than the Mont Blanc, while the Simplon would be about half as long again, but about 1,000ft. lower. Supposing that the operations would be conducted at the same rate as they have been at St. Gothard, the boring will take 4,218 days, or, working at both ends, 2,109—nearly six years. The total sum for the execution of the work is estimated at 45½ millions of francs (St. Gothard having cost 54 millions).

A SPEECH delivered by M. Turquet, the French Minister of Fine Arts, at the opening of an exhibition at Lille, is interesting with reference to a recent discussion in the House of Commons, to which we alluded on p. 189, ante, as an illustration of the manner in which the question of State aid in provincial art schools and museums is understood in France. In 1870 the number of French art schools was 20; in 1880 it was 250; it will exceed 300 in 1881. But the Government is not content with this, the object which it puts before itself being, according to M. Turquet, no less than the introduction of drawing as a compulsory subject into all primary schools without exception. Along with the great development of art education must naturally go a development of the means of the higher art culture—that is, of museums. Of the expenses of provincial museums "the Government will bear a considerable part. But you must do your best to help yourselves from the first; then we will do the rest." Here the true principle of self-help to be followed by State-help is succinctly stated. The one does not go without the other, but in France at all events the one follows the other.

PROF. EMERSON REYNOLDS describes a process for the protection of lead against corrosion, which is done by coating it with a film of sulphide of lead. He recommends the following method:—Take 16 grammes of solid caustic soda, dissolve it in 175 litres of water, and add to the liquid 17 grammes of nitrate of lead, or an equivalent of other lead salt, with 250 cubic centimeters of water; raise the temperature of the mixture to 90° C. If sufficient lead has been added the liquid will remain somewhat turbid after heating, and must then be rapidly strained or filtered through asbestos, glass-wool, or other suitable material, into a convenient vessel. The filtered liquid is then well mixed with 100 cubic centimeters of hot water, containing in solution

4 grammes of sulpho-urea or thio-carbamide. If the temperature of the mixture be maintained at about 70° C., deposition of sulphide of lead or galena, in the form of a fine adherent film or layer, quickly takes place on any object immersed in or covered with the liquid, provided the object be in a perfectly clean condition and suitable for the purpose. When the operation is properly conducted a layer of galena is obtained which is so strongly adherent that it can be easily polished by means of the usual leather polisher. It is not necessary to deposit the galena from hot liquids; but the deposition is more rapid than from cold solutions.

ANOTHER culprit has been sentenced to seven days' imprisonment for knocking off the "doll's heads," as the presiding alderman called them, on the Temple Bar memorial. The damage done amounts to one shilling, according to the testimony of one of the clerks from the City architects. Some member of the Court of Common Council might profitably move for a return of the expense to the Corporation, up to the present time, of protecting this precious specimen of civic art. The Griffin must have cost already, for police supervision, as much as a dozen ordinary bad characters.

MR. SEYMOUR HADEN has half made up his mind to go over to America, possibly in August, 1882, to repeat there the lectures on etching previously delivered in England. He also thinks of publishing these lectures in America. "No man," says the *American Art Review*, "would meet with a more cordial welcome than Mr. Haden, should he conclude to carry out his plans, and his coming would no doubt be a most powerful help in forwarding the movement which he and those who are interested in etching in this country have so much at heart."

The first sod of the Charnwood Forest Rail was turned on Wednesday by Lady Alice Packe, daughter of Earl Kimberley, at Loughborough, Leicestershire, in presence of a large company of spectators. The line will be eleven miles in extent, running through Charnwood Forest from Loughborough to Coalville. It will open up the collieries and the granite and sandstone quarries which abound in the neighbourhood. Lady Alice Packe was presented with a silver spade with which she turned the sod, amid cheers. The line will be completed in eighteen months.

It is proposed by the Viennese Society of Artists to open, from April 1 to September 30, 1882, in their enlarged galleries at Vienna, an exhibition of the chief works of national and foreign art that have been produced since the last great exhibition of 1873. The exhibition will comprise works of architecture, sculpture, die-sinking, painting, and drawing, as well as those of the various arts of reproduction. The Imperial and Royal Government, which has encouraged the undertaking with its warmest patronage, has notified its intention of giving prize medals to the most prominent of the exhibitors under the award of a jury.

The autumn exhibition of the Birmingham Royal Society of Artists opened its doors to the public on Monday. It is the largest, and in many respects the most interesting and generally attractive which has yet been held, thanks, in great measure, to the large proportion of noteworthy pictures from London and other exhibitions, which have been liberally lent by the owners for the enrichment of the collection. Among these special benefactors may be named the President of the Society, Sir Frederick Leighton, who sends the portrait of himself, painted by Dupuis, which formed the last Academy Exhibition, and Mr. Millais, who is represented by his "Sweetest Eyes were ever seen," from the late exhibition at the Grosvenor Gallery. Including some 150 water-colours, the exhibition comprises altogether 910 works.

MARBLE is generally considered to be a very rigid material. A remarkable case, however, is given by M. Guebbard, in *La Nature*, in which a marble slab at one side of a door in the Alhambra of Granada has been bent considerably out of position by superincumbent weight, without breaking. The slab is 3 metres high, 235mm. broad, and 64cm. thick. The greatest separation is about 8cm. It would be interesting to know how the slab would behave if the pressure were removed.

THE BUILDING NEWS.

LONDON, FRIDAY, SEPTEMBER 9, 1881.

ARCHITECTURAL COHERENCY.

AS we admire a literary composition because it is coherent and well knit together, or dislike it because it is loose and inconclusive in its method and arrangement, so in the same sense we can justify our admiration of a building which is well bound together, and which, if large, affects us as much by its continuity and appearance of sustained repetition as by the actual beauty of its details. Somehow, whenever we see a structure in which its architect has been trying to do his best to bring as many different fancies as he can together, and to show us the exhaustless resources of his imagination, we are inclined to put the attempt down to a conscious weakness of purpose and intention. A building of this sort only impresses us by its size and the vanity exhibited in attempting to foist upon us foreign features to make amends for the paucity of invention in the plan and distribution. As these forms have all been brought in and engrafted upon the plan, so we may be sure the plan, to that extent at least, has been rendered weak. Exactly the same effect occurs when foreign idioms and phrases are dragged in, head and shoulders as it were, into our vernacular without a due correspondence of meaning. It is impossible to carry a tangible line of thought or of design through the composition or the structure, because no distinct conception has been formed or worked out with integrity and honesty by its author.

To explain more practically what we mean by coherence in architecture we may consider a few of the terms used by architectural writers from Vitruvius downwards to designate certain qualities of design which have reference to the general relationship of the parts. Vitruvius speaks of "disposition" (*dispositio*) and "order," besides "eurythmia" and "proportion"—terms which express definite ideas, though they partly overlap one another.

The late Sir Digby Wyatt, in his *Slade Lectures on Fine Art*, discusses what we here call cohesion in speaking of Vitruvius's third quality of architecture—namely, "Order," as one which he interprets style; and we here quote what Sir Digby Wyatt has said of it. "To proceed to design without determining style is to waste both time and invention, since, as it is obvious that an expression of unity of thought should be manifested in the completed work, unless a certain definite mode of using materials which we understand as style is determined upon and adopted as a rule throughout our subsequent operations of thought, the work will be but a medley, a thing of shreds and patches." Style, however, does not exactly express what we mean by cohesion, and the same writer qualifies the sentence we have quoted by stating that what the Greeks "understood as order became a much more coherent and imperative principle than anything equivalent to what we can understand as style." Though the Doric and Ionic represent two distinct styles of Greek architecture, we are truly impressed more with their points of resemblance than difference, and we owe this sense of harmony to the orderly arrangement of the parts of each of these styles. The author, indeed, we have mentioned expresses the hope that, great as the differences may be between the styles in which we work, "time may so reconcile our varieties of practice as to give an appear-

ance of cohesion and harmony of principle to our system of architectural progression by antagonism." The diverse styles which the modern architect employs make him indifferent to follow in his work any definite mode of using materials. In working in so many forms he cannot, or will not, see that there is a system or grammar to each, and we are thus constantly witnessing the most astounding mixtures of structural expression. But the Greeks had another principle called by Vitruvius "Eurythmia," which architects in the present day no more care to understand than the ordinary letter-writer troubles himself about the meaning of the figure of speech called metonymy. Eurythmia simply meant the succession and grouping of parts; it was, in fact, a kind of measure of the parts of a building, an equivalent idea to measure in music. Although this term would be regarded by most artists in the present day, as expressing an abstract or ideal refinement of no practical value whatever, the Greek architect used it to express precisely the same thing or quality which the modern architect regrets the absence of when he says a design or building is wanting in harmony.

There are certain distinct methods by which a design may be made coherent. The most important is continuity or repetition of features. If we take a long façade, we say the design is coherent when the same parts are repeated throughout, not necessarily in consecutive order, but when the same series recurs at intervals—as, for example, a series of windows, or a tower, or roof; and one of the best modern instances of this continuity or repetition is to be seen in the river-front of the Houses of Parliament—a design which, whatever may be its faults in excessive elaboration of detail, is thoroughly coherent in its composition. For instance, the angle-towers balance the ends of the river-front of the palace, while the same form of window-bay is repeated, though broken in the centre by a variation, which prevents the appearance of monotony. The general horizontal lines of tracery and stringcourses and panels between the windows are continued; yet we do not feel burdened by a sense of mere mechanical balance of feature when we take into view the Victoria Tower of dominant height and size at one end, and the variety of forms of central lantern and Clock Tower, which destroy anything like monotony in the composition as a whole. All artists who love to paint the scenery of the Thames tacitly acknowledge, at least, the artistic grouping and outline of the Palace at Westminster; they all like to show its broad masses of gable, turret, and tower against the sky, and they all prefer to obliterate its detail by shadow, or to show it under the thick veil of mist and smoke in which it is generally enveloped. In spite of its wearisome detail, it is coherent. To take another admirable example—the river-front of Somerset House—we may notice the same continuity of line and feature, but broken at intervals by the porticos into a composition of an extremely rhythmical kind, a sort of regulated succession, such as we observe in musical composition, being evident. The whole secret of designing coherent façades of any length depends on carrying out an analogous succession or measure to that we find in music, where there exists a certain timed movement; to attempt here to lay down any precise rule of harmonic ratio, as some have done, would be out of place and unnecessary, as every architect with any artistic sensibility knows how to vary his features in pleasing proportions, an expression or part of the elevation being caught up, repeated or emphasised at intervals. There is a law of interchange and symmetry which an artist understands, though he may laugh at the term and prefer his own mode

of expression to it. Coherence can also be obtained by emphasising certain features preserving a symmetrical arrangement or balance of them, and it would be useless to enumerate examples of this principle, which seems to be expressed by the law of unity in variety.

In narrow lofty elevations of street houses the principle must be looked for not in horizontal lines and repetitions, which of course are extremely limited, but in the vertical direction. We frequently find that a number of strongly marked horizontal divisions, accompanied by a varied design of window in the several stories, destroy the coherence of a front. The parts are piled up one over the other, and as they present no similarity in the forms and details, there is a painful sense of incoherency. Attention to the division of the stories, strongly marking the basement by a cornice and then defining with less strength the divisions of the upper stories, till we come to the main cornice of the façade, at once removes the disagreeable sense of the "piling up of agonies" we often see in street-fronts. It may also be found that by repeating the same form of window, though of different proportion, in the middle stories, a vertical continuity is preserved, the composition seems to grow upwards, and does not appear to have the disconnected piecemeal effect it would have had if the strings and cornices were all equally spaced and emphasised. All good Classical or Italian buildings observe this rule even when stories are marked by distinct orders of columns. It is easy to vary the proportions of the height of order and the projections of the cornices by breaking back, &c., and to so vary the succession of window design, that vertical homogeneity or connection is not lost sight of, and in the best works of Italian and French Renaissance the vertical features were so well related that the composition seems to be a succession of well-marked bays, the piers, or pilasters being more prominent than the horizontal lines. One may see the want of this quality of design in any of our streets. Cheapside abounds in examples of incoherent jumbles, and so does Oxford-street, Fleet-street, and the Strand, though it would be a vain wish to expect any approach to architectural consistency under leasehold tenure.

In tower designs cohesiveness is of great importance. Very many costly towers have been spoilt by an incongruous piling up of stories, having nothing in common to lead the eye upward, and the designs *in esse* and *in posse* we have seen for towers in buildings for municipal purposes frequently suffer from strongly-marked divisions. Mr. Street has instanced the campanile of Giotto at Florence as showing a rhythmical principle in the division of the seven principal stages, which are not regular but arranged in groups. The upper stage here is equal to two of the under ones, which are coupled. Enough has been said to indicate the value of the principle held so tenaciously by both the Greek and the Gothic architects in their best days. Modulation with them was something more than a mere fancy; it was a system reduced to something like scientific rule, by which the parts were related to one another by gentle approximations so as to avoid discordance and to produce a pleasing gradation, either from the basement to the summit, or through the whole length of a composition.

TOWN DWELLINGS AND WAREHOUSES, AND THEIR DANGERS.

TWO or three serious fires, one attended with fatal consequences, and the others leading to a disastrous conflagration and loss of property, have again given us warning of the dangers to which householders

in towns are constantly exposed. Even the regulations of the Metropolitan Building Act are impotent to render a house in a dense thoroughfare safe from the risks of fire; and it is not very assuring for occupants of the upper floors of town dwellings to be so constantly reminded that they stand a poor chance of escape in case of a fire in the lower part of the premises. When the only means of escape can be so very easily cut off as to render descent impossible, the owners and builders of houses in streets can derive but trifling advantage from fire-resisting party-walls, and other precautions found in the miscellaneous provisions of the Building Act. To confine a fire between two party-walls, and to make it impossible for a fire breaking out in one property from imperilling the adjoining houses, is, nevertheless, a great point in the construction of towns, and this practical limitation of risk is what has given the metropolis a guarantee of security not enjoyed by many large cities. It is some satisfaction for an adjacent owner to know that in case of fire next door he stands little risk of having his property destroyed, and he feels contented if the only inconvenience he suffers is the breaking of a few window-panes, and the damage done by heat and water to a part of his stock. He places some confidence in the rule which makes it incumbent on the builder of every party-wall, that the said wall shall be carried up above the roof or gutter of the highest adjoining building to a height of 15in., measured at right angles to the slope of roof; and he believes that no timber has been placed within ignitable distance of any flue, and that all combustible materials have been shielded from harm. But with regard to what happens between his own walls he has not any protection whatever. If a fire breaks out in his cellar or in any part of his premises, he is completely at the mercy of the fire-brigade, and their vigilance is the only chance he possesses. We are of course alluding to houses built in the ordinary manner, and where a staircase, generally of wood, is the chief communication between the several stories. Built in the manner the usual dwelling-house is, there is no possible check to the progress of flames upwards through the opening of the staircase well-hole. It forms a shaft fed by the openings below, and the fire originating in a lower room naturally finds its way through it. The recent case of the fatal fire at Notting Hill, which occurred a few days ago, affords an instance of the manner in which a dwelling-house and its inmates may fall a prey to a fire accidentally kindled below the staircase, which ought to have been capable of being easily extinguished. In the house in Blagrove-road the fire originated in a cupboard which it appears was immediately beneath the staircase, and although at first confined to a small space, the efforts made by the affrighted inmates were quite unable to subdue or even check the flames, which ascended the staircase and burnt out the interior. As this house was constructed in precisely the same manner as thousands of dwelling houses in towns, we may take it as a typical instance of the danger to which occupants are daily exposed. It is hardly flattering to our knowledge of scientific construction to suppose that a fire of this kind could not have been easily placed under control if the proper means had been adopted to confine the flames. Cupboards under staircases used by several tenants are, under the best of regulations, liable to accidents through the mischief of children with lucifer-matches, or the carelessness of persons who enter often with lighted candles. Even in private houses the small cupboard often under the first flight is a dangerous receptacle for combustible materials with which they are frequently stored. But why should they be the lurking-places of a foe so formidable? Why should builders

still go on erecting houses by the row and making closets under stairs, without the smallest precaution to protect the woodwork of the main access, also the means of escape to the whole house? When a lighted candle is taken into a closet of this kind it is sometimes left on a shelf, or its flame is brought within a few inches of the most inflammable part of the interior. Naturally dry, ignition is only a question of a few moments; a spark may be left which is speedily fanned into a flame by the draught. But there is no by-law or regulation which makes it imperative on builders to construct staircases with fireproof materials, or to protect from ignition the underside of wooden stairs. In nearly all dwelling-houses of a low rental, we seldom find plaster ceilings to the lower flights; the bare risers and treads are left without protection just at those parts at which the chances of danger from fire are the greatest. The only section which refers to accesses and stairs in the Metropolitan Building Act (sect. 22) applies to public and other buildings which contain a larger cubic space than 125,000 cubic feet, such dwelling-house being used for separate families. In such dwellings, the lobbies, corridors, passages, and landings, also the stairs, are provided to be of "stone or other fire-proof material," carried by fire-proof supports. Now, an ordinary four-story dwelling-house would not contain 10,000 cubic feet, and to houses of this class, numerous as they are, as well as to others of much larger size and accommodation, the rule does not afford any help. Here there is undoubtedly a serious omission in the Act, and one which needs attention; and we think that every town dwelling-house should be built in such a manner that its entrances, lobbies, passages, and staircases, should not only be made between brick or other incombustible walls; but that the stairs and the landings at least should be constructed of fire-resisting materials. The wooden stair, with its closet under, filled up with matchboarding, ought not to be possible; and it ought further to be required that for dwellings intended for separate families, whatever the cubic contents, the floors dividing the stories should be constructed of concrete or iron joists. There is the "Dennett," and one or two other systems of flooring, which would be quite as inexpensive as good flooring of timber; while dwellers in large town houses would then sleep in peace, without the disturbing fear that a careless lodger or tenant below him might have accidentally left a light below the staircase, or ignited the curtains in his own room, and have cut off the only chance of escape. The risks of living on the upper floor of a four- or five-storied house, as ordinarily built, with other tenants below, are great indeed, in London; but these would be considerably diminished or entirely eliminated by requiring that every story should be so independent of those above and below it, that in case of a conflagration, its occupants and furniture might at least be saved from destruction. We are sure houses of this class would pay a good return for the additional security to life and property guaranteed, and the saving in insurance would more than compensate the owners.

To take a second recent instance: The extensive destruction of property in Cheapside last week affords another startling proof of the imperfection of our building regulations in the construction of fire-resisting warehouses. People gaze up into an empty, fragile shell of burnt and crumbled stonework held together in a very feeble manner by a few wrought-iron plate-girders, and wonder that of all the apparent solidity of the structure but lately reared at the corner of Cheapside and Bread-street, it is the only surviving witness. Well may a bystander, looking at the ruins, inquire, Where are the inside walls—surely there must have been

apartments? The eye, at least, sees none, but pierces through large openings which make the small piers and mullions look like the bars and rails of a huge iron cage. The surface of window and glass is so great as to appear out of all proportion to the flimsy piers and the connecting lintels of stone which constitute all that remains of a once large building of five or six stories in height. In such a serious and alarming conflagration which lit up the City last week at the corner of Cheapside and Bread-street, the whole interior of a large wine and spirit warehouse was burnt out in a remarkably short space of time. The party-wall on the west side looks intact, and but for this barrier the fire must have extended its ravages to other similarly-built premises. On the east side, facing Bread-street, the frontage of stone is calcined to such a degree that it presents quite a crumbling mass of ruin; the pilasters which divided the window-openings and the carved entablatures are completely undistinguishable; the angles and surfaces have everywhere crumbled away, leaving a rough core of stone that looks as if it had become disintegrated from time and the weather. The remaining piers and entablatures are held together by the cross iron girders, but the whole has so very tottering an appearance that the authorities have wisely closed the side thoroughfare and barricaded a considerable area of the roadway in Cheapside. We simply allude to this case to show that it is possible for a large building to be completely gutted by fire in spite of building rules, and to positively endanger property within a few feet of it in the street adjacent, which has seriously suffered. The first thing which strikes the spectators of the ruin is the large superficies of window-openings to the solid parts of the walls, the openings amounting to nearly three-fourths of the entire area, and the small size and area of the piers, which are only prevented from falling by the horizontal lintels and arches, and the cross plate girders. Had the windows occupied the usual proportion of the wall area, the burning and scorching of the adjacent property would have been much less than it is, and the fire would have in all probability inflicted little external damage. Then the rapidity and completeness with which the flames have swept away every thing from basement to roof, leaving only a few iron beams, columns, and principals, leads one to the conclusion that the enormous space presented nothing to interpose or check the progress of the flames from the place where they originated. Apparently, at least, no wall of brick is seen; and on this point we are led to inquire if other buildings used for warehouses in the City are similarly constructed? There is a wholesome rule which provides that every warehouse or building wholly or partly used for trade or manufacture, should contain not more than 216,000 cubic feet; that is to say, that larger buildings shall be divided by party-walls. Unfortunately, as we have said before, we have no proof that this rule is vigilantly enforced in some cases, and the meaning of this rule has unfortunately been interpreted in different senses, as in one or two decisions we find the courts have sanctioned openings in party-walls above the roofs of town-houses. But what we desire to say here does not concern the "imperforate party-wall," a principle which is rightly adhered to in most cases, and has often prevented conflagrations of an alarming character. Our contention now is that huge warehouses may be built, conforming in all respects to the letter of the Building Act, yet virtually without any real fireproof qualities whatever. We know how large blocks of buildings, intended partly for warehouses and partly for

offices, are built. No definite internal arrangement is made or partitions constructed; the floors are let to the best bidders; and the entire area, apportioned in the most convenient way, is decided upon after the main structure has been built; the consequence of which is each tenant of a floor has his match-board partitions erected, and the whole interior within the four walls is at the mercy of an accidental explosion, gas-escape, or carelessly-thrown light. As a poor and worthless subterfuge, the floors may have iron girders; but these are only introduced for structural reasons, and the rest of the floors being of wood instead of concrete, the fire, if one breaks out, cannot be confined to its immediate quarter. What we say is, large buildings can be erected with adequate means of security, as we recently showed in the case of the stores in the Haymarket, by staying the spread of flames from devastating the whole building, and it is not too much to expect a Building Act to cope with cases of this kind, instead of allowing buildings to be erected which are really little better than huge tinder-boxes.

With regard to the question of the danger of stone becoming calcined and the area of window-opening, the recent case we have referred to might be profitably considered in future erections. Another element of danger is here added. A well-built brick warehouse, though with numerous openings, is known to stand without any serious damage, though the interior has been burnt out; but in the building in Cheapside the standing masonry is only prevented from toppling over by the few iron ties which connect them at the floors. The stone on the east side has been reduced to quicklime, and has suffered in a manner which would hardly have been expected, and the whole will probably have to be rebuilt. The piers look decidedly small and fragile since the fire, and they can scarcely be designated as portions of wall. Their surface at least was insufficient to become an effectual barrier to the flames which shot up round them with marvellous rapidity, and enveloped both the front and back, so that an intense heat was brought to bear upon all sides of the stonework. Possibly the broken parts of cornice and piers on the east side may have been twisted off by the action of the heat on the lighter ironwork of the roof; we have here at least an instance of a fire which has left a very pathetic and instructive memorial of its ravages.

NEW FURNITURE AND DECORATION.

RECENT works in furniture and decoration indicate a decided departure from the heavy and somewhat crude forms which have had a considerable run of public patronage under the name of "Queen Anne." We have no hesitation in affirming that the style, both in building and decoration, has already seen its best days, and that the future artistic taste will be towards a rather purer form of art. Italian, and the style which in England took its rise from the Cinque-cento and Louis Seize, appear to occupy the attention of our leading manufacturers. Messrs. Gillow, for instance, Messrs. Jackson and Graham, Messrs. Holland, and other West-end firms chiefly work in these styles, and in a few years probably heavy Stuart furniture will be in less request than the French work of contemporary date. The very spacious and handsomely fitted-up showrooms of Messrs. Gillow contain some choice modern articles of furniture and decoration. We just allude to some beautiful Italian cabinets of inlaid work, which fill up one of their rooms. The Certosa work is superb, as may be seen in a handsome cabinet in that style, richly inlaid with ivory. Other cabinets, inlaid with marquetry of ivory, &c., are excellent

examples of the Certosino work. The fine scrolls and wire-stalked flower-work, and the conventional rendering of the artists of this school may afford useful lessons to modern inlayers. Some French work of modern manufacture in the Italian style, also of ebonised wood, inlaid with ivory arabesques, lack breadth, the details look overcrowded, and they ill compare with the Italian cabinet ornamentation. In decorative work the visitor to Messrs. Gillow will find much that will interest him. He will see both Italian and later styles of decoration. We need only mention a small room decorated in the style of the Adams Brothers, the ceilings and walls being relieved with light tints of grey and green. We notice a design for decoration to a picture-gallery at Great Malvern. There is a bold coved or lantern ceiling, with ribs of wood, and the plaster-work is to be relieved with scrolls and diaper-work in light tints on a grey ground, the patterns alternating. The walls are covered with a dark rich red or deep chocolate fabric. Painted woodwork, in the style of the 18th century, in a semi-Classic style, in which Pompeian arabesques are introduced, is another style of decoration which seems likely to be revived. The objection to decoration of this kind is that it is likely to fall into the hands of incompetent artists. Excessive and elaborate designs are reproduced upon every plain face of the woodwork, and all character and breadth become lost. Delicacy of feeling in design and colour and decision of handling are required to produce good results in painted decoration if we desire to emulate the work of Louis XVI.; and marquetry being only an art that can be practised for the wealthy, our artists of furniture may turn their attention to relief of this kind. It was, indeed, the cost of the cabinet-work of the latter period which has driven manufacturers to reproduce the sideboards, cabinets, chairs, and tables of the Stuart or Flemish style.

In the production of cheap furniture of artistic design, Messrs. Jackson and Graham, among other manufacturers, have endeavoured to meet the requirements of those who cannot afford to furnish their houses with Italian, French, or Chippendale furniture. They are making some very excellent buffets and other furniture of exceedingly simple design, the lines of the framework being relieved by plain flutings and moulded work. A buffet of this description we recently described, designed by Mr. R. W. Edis, and we now draw attention to the chimney-pieces of various woods, wall-panelling in painted deal; suites of bedroom furniture, made in pine, and stained green with black mouldings; some excellent painted bedroom furniture, all produced by machinery, at reasonable cost. A combined cabinet bookcase and cupboard is a useful piece of furniture, in good taste, and well suited for small houses, and instead of bad carving we have panels and other details of Japanese design introduced to give lightness, and variety. Fabrics for wall-decoration, hangings, coverings, and other purposes form another branch of decoration, which has made considerable progress. The "Lincrusta-Walton" and the more recent "Papyrotile" decoration we have only lately mentioned in favourable terms, and we must not omit improved textile fabrics. Those who want to see what English manufacturers have done to compete with foreign work of this class may take a glance at the exceedingly bold, fresh, and artistic designs for wall-papers, chintzes, embroideries, and hangings manufactured by Messrs. Morris and Co. Besides a really conventional treatment of foliage applied to surface, Mr. Morris's designs show a thorough feeling for harmonious colouring. We just have room to mention a bold wall-paper, with acanthus leaves and scrolls; another of chrysanthemums and poppies, a poppy-pat-

tern in gold on a light salmon ground, also printed in a rich red, and several admirable chintzes and carpets, all breathing an Oriental spirit, and of highly pleasing and harmonious colours. The patterns are all flat, the drawing is bold, yet refined, and the surfaces are well covered in a true decorative spirit.

We have this week inspected some new furniture manufactured by Messrs. Jenks and Wood, of 65, Holborn Viaduct, for a gentleman's residence. The designs have been prepared by the artists of the firm, and the furniture comprises bedroom suites, dining-room, library, and billiard-room furniture, besides hall-table, cabinet, and seat, in English oak. The bedroom suite is of Renaissance design, and includes some costly and handsome pieces of furniture, in which relief has been obtained by combining choice pieces of figured or burr walnut, with plank or straight-grained walnut, the lines of framing being brought out by ebony mouldings in a sort of French style. A large wardrobe comprising a pedimented centre with two wings has been executed in this manner; the doors and drawers below have panels of burr walnut, with straight-grain rails, and stiles relieved by ebony mouldings. The Arabian bedstead which is made to match has a large canopy carried by carved pillars and brackets of walnut; the footboard is very effectively relieved by the two varieties of walnut in panels on a framing of mahogany; and the top and ends are carved in a free and spirited manner. The toilet-table has also a mirror with broken pediment over, supported by carved brackets and small drawers. This piece of furniture has been constructed for a bay or oriel window, and no cost has been spared, as may be inferred when we say the table and glass are finished equally well on both sides. Below the table are pedestals with drawers, and the details and receptacles for nic-nacs have been studied as much for convenience as for elegance. In connection with this suite are cupboards for the bedroom-ware, also executed with the same thoroughness. Another choice piece is a circular table of large size in wood, stained to imitate ebony. The top is supported by four massive carved trusses, resting upon cross foot-rails. In the centre a massive vase-shaped pedestal, richly carved, rises from the intersection of the cross pieces and helps to support the table. For the same suite we notice a writing-table of quiet and sensible design with drawers.

An American walnut suite may be mentioned, for the spirited and thorough manner in which the style, Queen Anne, has been carried out, and we remark with satisfaction a pier or cheval-glass frame, executed and carved in the spirit of the style with a freely-curved broken pediment; a sofa-table with carved standards of elegant, rather Italian design, and an oval table of more English detail. A very handsome and massively-framed table, octagon in shape, made for the library, covered with leather, is noteworthy for the manner walnut and rosewood have been introduced. The moulded edge of the table is of walnut, with inlays of rosewood, and the supports of the table rest upon five pillar-legs, framed into cross rails. Four of these rest upon the ends of the rails and are solid balusters, the ornament being chiefly confined to moulded caps and bases, and inlaid rosewood flutings. The centre pillar is very massive, of octagonal shape, similarly relieved. The book-waggon, intended also for the library, has been designed in the same sort of 16th-century Italian or Elizabethan style, with the angle-pillars placed diagonally, and with a scroll-supported upper shelf. Among the other manufactured articles for the same house, we can only mention a very massively-designed hall-table and seat of English oak,

carried out in a thorough Elizabethan spirit, and evincing much knowledge and feeling of the details of that style. The seat has a plain back relieved with carved panelwork under a fluted-curved pediment-top from end to end; there is a carved frieze or band running below this, and the end arms are carved with grotesque lions. The legs are executed in the solid Tudor style, forming stout pillars with Ionic volutes at the top. The hall-table legs are also bulged in the same grotesque style, supported by carved scrollwork. In looking at the handsome hall cabinet, a bulky piece of furniture, in the same style, even a connoisseur might imagine he had before him a real piece of antique furniture. The massive pillar legs of the bulky type met with in furniture of this date, and common to the Stuart or Flemish character, supporting the massively-carved shelves, and the scrollwork top, are excellent reproductions of the details of this period, heavy and cumbersome perhaps, and yet so suitable for hall fittings. In a similar style is a handsome dining-room buffet, of brown oak, polished. It has a centre convex mirror and side tiers for china, besides richly-carved shelves for larger bronzes or pottery below. Surmounting it the mouldings are turned to form a circular pediment, the whole being crowned by a sort of attic, carved with bold leaf-ornaments at the angles. Carvings of birds and foliage fill up the pediments and spandrels of glass, which is further heightened in relief by gilt balls in a hollow moulding of the dark oak. Messrs. Jenks and Wood have also manufactured furniture for a billiard-room, in which the Elizabethan style and grotesque carving have been introduced; and we may speak highly of the general manner in which the furniture has been made to suit the rooms, of the ingenuity which has been exercised in introducing a perforated brass coil case for heating purposes below a table, so as to represent a centre pillar, and of the moderation and taste shown in preserving harmony throughout the house. The furniture, which has been manufactured by Messrs. Jenks and Wood from their own designs, at least serves to show that the public are beginning to prefer well-made solid furniture to the poor, feeble stuff we used to see in the warehouses a quarter of a century ago, and we note with satisfaction that the exceedingly crude forms of Jacobean and Dutch articles are beginning to be set aside by the leading firms of the trade for a kind of Renaissance treatment, which unites the best of the florid types of the 16th century with the common-sense, lightness, and elegance of the 18th-century taste.

RACK-RAILWAYS ON THE CONTINENT.

It will be remembered with what interest a few years ago the opening of the line from Vitznau up the Righi was regarded. Since 1873, when it came fully into operation, this line, so bold in design, and offering such splendid views without the concomitant of fatigue, has proved a great attraction to tourists, and up to the present, we learn, some six hundred thousand passengers and twenty-five thousand tons of various goods have been conveyed on it. Thus experience has completely sanctioned the enterprise, and any fears that were felt at the outset have been dissipated.

It is not wonderful, therefore, that the attention of engineers and the public generally has been attracted to the feasibility of applying the same principle of railway locomotion for ascent in various other places, and so saving the long detours and expensive constructions that are required for locomotives acting by mere adherence. Thus, several new lines of the same type have been

constructed on the Continent; in 1871, the lines of Kahlenberg, near Vienna, and of Schwabenberg, near Buda, the gradient of which is about 10 per cent; and in 1875, that of Arth, on Lake Zug, to the Righi, the gradient of which is about 21 per cent. These lines, designed chiefly for the transport of tourists, like that of Vitznau-Righi, are worked only in summer. They are furnished with a rack-rail throughout their length.

More recently (according to *La Nature*) M. Riggenschach, the director of the works at Aarau, whose name is now closely associated with the construction of rack-railways in Europe, has devised a new type of mixed locomotive, capable both of going like an ordinary locomotive, on the usual lines (by simple adherence), and of engaging in a rack-rail when necessary, on the parts of a line furnished with such a rail. Under these conditions it becomes possible to connect such lines with ordinary lines, and to construct them inexpensively, placing the line directly on the ground, and merely adding a rack-rail for steep inclines.

In this way have been made the industrial lines from Ostermündigen to Berne, that of Wasseraflingen, in Wurtemberg, designed for transport of ores and scoria, that of Rütli, in the canton of Zurich, and the line of Oberlahnstein. Perhaps the most important of all is the line from Rorschach to Heiden, which is a railway for permanent traffic, serving both for carriage of passengers and of merchandise. It is connected at the Rorschach Station with the line of Swiss railways which goes along the Lake of Constance. For some way it is on level ground, then it rises in a part furnished with a rack-rail, through some very picturesque scenery to the town of Heiden, well known to tourists, and also to invalids (for its whey-cure). The total length of the line from Rorschach to Heiden is 5 kilometres 600, and the average incline is about 9 per cent.

The success obtained on this line, which has been worked up to the present without any interruption even in winter, has recommended the application of rack-railways for connection of greater lines; and a serious investigation has been made with a view to constructing such a railway over the mountains of the Black Forest, from Fribourg to Neustadt, so as to connect the valley of the Rhine with that of the Danube. It has even been a question to apply the principle on the approaches to the St. Gothard tunnel. It is certain that the adoption of rack-railways, while involving great difficulties in the working of an important line, allows, on the other hand, of reducing the cost of construction in a very large proportion, for the cost of establishing the rack-rail hardly exceeds 30,000 francs per kilometre; and, on the other hand, the length of line to be constructed is very much reduced.

A locomotive with vertical boiler, designed by M. Riggenschach for the mixed lines with variable slope, is represented in *La Nature*. The form given to the boiler presents the advantage of diminishing the amplitude of oscillation of the water after passage from level ground to the incline; and the crown-plate is never uncovered.

The arrangement which is of primary interest in the mixed locomotives is that for transmission of the movement, which must vary with the nature of the way. The piston generally actuates an intermediate axle which, by means of wheels and gearing, transmits the force either to a drum catching in the rack-rail, or through a second false axle to the wheels acting by adherence. A clutch-system, ingeniously arranged, allows of changing the mode of action at will; but, in any case, the two transmissions do not act simultaneously; otherwise slipping would occur, the traverse of the smooth wheels on their rails being different from

that of the motor pinion on the rack-rail, supposing there is a slight difference in diameter.

In another arrangement adopted by M. Riggenschach, the toothed wheel is keyed on the axle of the wheels acting by adherence; but the latter then carries two supplementary wheels not keyed, which, in the parts of the line having a rack-rail, turn on special rails raised above the others, the adherence wheels then turning freely in the air, without hindering the action of the motor pinion.

M. Riggenschach's locomotives are all provided with an air-brake, peculiarly sure and efficacious, which prevents any dangerous acceleration in descent. The cylinders are then isolated from the boiler, and the pistons act by drawing air from the atmosphere; this is compressed into the admission-tubes, and given back into the atmosphere through a narrow orifice, which the engine-driver can open or close at will, so as to modify the retardative pressure as needed.

The entrance on the rack-railway from the level portion, in these mixed lines, presented certain difficulties, for it was necessary to stop the engine, and place (with the hand) the free end of the rack-rail under the toothed wheel, so that the latter should catch. By the arrangement now adopted, however, this passage is effected automatically, without shock, and without its being necessary to stop the engine.

The fixed rack is prolonged in a piece of rack which is mobile, and the teeth, instead of being simply steps riveted at their extremities in the two lateral cheeks, are supported on a continuous bar without cheeks. This bar is articulated to the fixed rack, and it rests on two springs, one laminated, the other spiral. Two lateral guides prevent deviation of the movable rack. By virtue of the springs, the movable rack yields softly under the impulse of the toothed wheel, which comes to engage regularly before reaching the fixed rack.

THE BRITISH ASSOCIATION.

THE Jubilee meeting of the British Association at York ended on Wednesday. The meeting has been a very successful and interesting one. Full reports of the best papers will be found in the *English Mechanic and World of Science*. We have, of course, only space to spare for a few extracts more especially pertaining to matters of interest to our readers.

BAROMETRIC PRESSURE AND SPRING WATER.

Mr. Baldwin Latham, M.Inst.C.E., F.G.S., F.M.S., read a paper before the Geological Section, the subject being the "Influence of Barometric Pressure on the Discharge of Water from Springs." The author of this paper mentioned that it was alleged by some of the long-established millers on the chalk streams, that they were able to foretell the appearance of rainfall from a sensible increase in the volume of water flowing down the stream before the period of rainfall. He had, therefore, undertaken a series of observations to investigate the phenomena, and he found, in setting up gauges in the Bourne flow in the Caterham Valley, near Croydon, in the spring of this year (1881), and selecting periods when there was no rain to vitiate the results, that, whenever there was a rapid fall in the barometer, there was a corresponding increase in the volume of water flowing, and with a rise of the barometer, there was a diminution in the flow. The gaugings of deep wells also confirmed these observations; for where there was a large amount of water held by capillarity in the strata above the water-line, at that period of the year when the wells became sensitive and the flow from the strata was sluggish; that a fall in the barometer coincided with a rise in the water-line, and that under conditions of high barometric pressure the water-line was lowered. Percolating gauges also gave similar evidence, for after percolation had ceased and the filter was apparently dry, a rapid fall of the barometer occurring, a small quantity of water passed from the percolating

gauges. The conclusion arrived at was that atmospheric pressure exercises a marked influence upon the escape of water from springs. The author remarked that the mineral constituents of water only varied very slightly from year to year, notwithstanding the volume of water which flowed.

Professor Prestwich, F.R.S., did not feel convinced that sufficient evidence had been supplied for the determination of the question; but he hoped that Mr. Baldwin Latham would continue his experiments towards the elucidation of this interesting point. Dr. J. Evans, F.R.S., however, believed that the author had brought forward sufficient facts to substantiate the theory raised. Mr. Bateman, C.E., agreed that barometric pressure had, to a certain extent, an influence on spring water issuing through absorbent strata like chalk. They must not forget, however, that the amount of water in wells must be influenced by the proportionate rainfall over a certain period. Professor T. McK. Hughes having said that hydrometric conditions would be exceedingly important in such an investigation, other speakers considered that the result of the inquiry would be of great public utility. Mr. Scott, of the Meteorological Office, considered that Mr. Baldwin Latham had proved his case. The only difficulty with him was how the Bourne in the first instance began to flow. Mr. Baldwin Latham said he had found no analogy whatever between water and the hydrometric state of the atmosphere. He had been led into this investigation by the fact that although Croydon took its water-supply from a chalk formation, it was visited with typhoid fever every ten years. He found that at an interval of every decade there were marked periods of low water, and these were marked periods of fever in the country. The underground water had an immense bearing on the public health of the country. If persons would take measurements in wells it would be found to be of great value with regard to sanitary results. The Bourne flow had nothing to do with barometric pressure: it was simply owing to the super-saturation of the North Downs with water.

YORK AND RIPON CATHEDRALS SAFE.

In the course of a discussion on a paper by Mr. Cameron on some remarkable land-shrinkages between Ripon and Hartlepool,

Professor Hull said that an uncomfortable feeling had sprung up in his mind whilst listening to the paper with regard to Ripon. It was fortunate for York that it was a considerable distance beyond the confines of the magnesian limestone formation. The formation did exist under York; but it was at a great distance from it, and was separated by other strata, and they might therefore assume that the York Minister was safe from excavations caused by underground waters percolating through the limestone. He would like to know if it was at all feared that an excavation was taking place under the Ripon Cathedral. At present while other portions seemed to be settling, the Cathedral still remained in its ancient magnificence. The Rev. W. H. Oxyer, Grewelthorpe, Ripon, said one of the holes at Ripon caused by subsidence was at first between 80ft. and 100ft. deep, and 200ft. in diameter, and the sides were quite perpendicular. There was, however, not much danger with regard to the Cathedral, as the pits were in a different line to the sacred edifice.

THE VIKING SHIP.

Mr. J. Harris Stone, M.A., read a paper before the Department of Anthropology on "The Viking Ship." He said that instead of an antiquated vessel with primitive-drawn lines, they found that the ship now lying at Christiania was a smart, trim-looking craft, built on what sailors would call beautiful lines, and well adapted for speed and general seaworthiness. It was difficult to believe that the vessel, which was well preserved down to the smallest details, was about 1,000 years old. It seemed, from the discovery of this ancient galley in such a perfect state, that the progress of mankind in ship-building had not been great. Mr. Stone said he had paid several visits to the ship, and had carefully examined her. After fixing as near as possible the probable date of the vessel by referring to the Viking period, he shortly alluded to the Frithiot Saga, and gave a few extracts bearing upon the ships for the purpose of showing the feeling of the people of the period towards the vessels, and also as explaining the

careful and thorough workmanship so clearly evinced in this ship, which was discovered at Sandefjord, in Norway, last year. The vessel was found in a mound, a Viking having been buried in her. It contained a sepulchral chamber, in which were found a number of loose articles, which Mr. Stone described. The discovery of the ship threw a light upon a dark period of history; and when they imagined such ships, manned by the Vikings, they no longer wondered at their inroads upon our coasts. Mr. Howarth said that last year he happened to be in Christiania, and paid a visit to the ship. The shields which were found on the ship were too thin to have been anything but part of the panoply of a funeral. He regarded it as fortunate that at last they had got an example of this kind; they had previously had a ship—which was in many respects similar in construction, and was found in Jutland—representing the Iron Age. It would seem to have been a burial rather than a case of a body having been burnt on a pyre; and, therefore, he concluded that it was probable that the burial took place after Christian times. Dr. Phéné pointed out that it seemed to have been by custom, and not by accident, that the ship was immured; but it was an accident that it was immured in blue clay, which preserved it. He regarded it as an open question whether this ship might not be attributed to Norsemen in some way or other.

INTRENCHMENTS OF THE YORKSHIRE WOLDS.

General Pitt-Rivers, F.R.S., read a paper on the "Intrenchments of the Yorkshire Wolds, and Excavations in the Earthwork called Danes' Dike at Flamborough." After describing the topography of Flamborough, he said that, assuming most of the low ground to have been occupied in prehistoric times by marsh and jungle, there would remain only the plateau land on the hills for the inhabitants to live upon; and here they found the ground covered with their remains, consisting of tumuli, pits, camps, and entrenchments, which perhaps were more abundant here than in any part of England, the Wolds having only recently been brought under cultivation. Much of these have already been destroyed by the plough, but they had been well delineated on the Ordnance maps, and it was important to consider the condition of things implied by the direction of the intrenchments before they had entirely disappeared. Flamborough Head and promontory must, of course, have formed the base of operations for warlike purposes in any case, whether they were with an invading or retreating force. In the former case it would be the first, and in the latter it would be the last, point occupied by any people at war with the inhabitants of the interior, its high cliffs precluding all possibility of attack from the sea, and leaving only the land side to be attended to. They would naturally expect to find an intrenchment facing westward, and occupying the first suitable position westward; and they found such intrenchment in the Danes' Dike—a misnomer, but not more erroneously named than others which were attributed to those pirates and ravagers of the sea-coast of England in other places. This dike ran north and south, a distance of two miles and a half from sea-cliff to sea-cliff, and at a distance of three miles from the centre of it to the point of the promontory. It had a ditch on the west or inland side, showing that the enemy was expected from that quarter. Its position appeared to have been determined by a deep but not very broad ravine, which ran from the interior southward into the sea, and protected the left end of the intrenchment for seven furlongs, or about one-third of its entire length. The west of the line of the dike was well chosen for defence, following the slope of the ground, so as to command a good view of land on the outside. There were twelve gaps through it, some of which, no doubt, were modern. The gap through which the road from Bampton to Flamborough passed appeared to be an old entrance, because the road there turned as if had been diverted in order to pass through the gap. The intrenchment was of nearly uniform height, being about 15ft. above the level of the ground, and having a ditch 60ft. wide on the outside. Of the defensive character of this intrenchment there could not be the slightest doubt; it was a work of great strength, probably surmounted originally by a palisade, and implying a large and well-disciplined force for the construction and defence of it. At Argam were found the remains of the great

earthwork known as the Argam Dike, running along the edge of the hills in the precise position for defence as they went inland from Danes' Dike. After further tracing the course of the intrenchment, the paper stated that a combination of circumstances, including its generally strong position on the side of the valley, the fact of its being the first position inland from Flamborough Dike, the position of the ditch—its strong flanks and general direction—united in favouring the opinion that the Argam Dike was in reality a defensive work, and not a mere road from Filey to Rudstone, though it may undoubtedly have served both purposes, both places being of great antiquity. Passing to the North Wold, there was found an intrenchment running along the escarpment of the Derwent Valley. It originally extended from Hummanby on the east to above Heslerton on the west, and guarded the North Wold hills from an attack from the Derwent Valley. A branch of this dike ran in a south-westerly direction from the high ground above Sherburn to the high ground at Linton, and there turned to the west along the hills to Thorpe Basset Wold, thus defending from attack by the north-west up the valley at Winttringham. But the most instructive portion of the whole district was the oolite range to the north of the Derwent Valley, which hills were cut up by deep ravines affording numerous strong positions for defence. After describing the results of a cutting into Danes' Dike in 1879, General Pitt-Rivers said from these discoveries they had evidence that the defenders of the earthwork used flint, and consequently that the work itself was not later than the bronze period, but that it was in fact of the same age as the tumuli of the Yorkshire Wolds. Whence did the people come who invaded the coast at this place? Having noticed the theories raised on this subject, he remarked that in his opinion the invaders of Flamborough—if invaders they were—were the same people who landed on the south and south-east coasts of England; or else, that these dikes belonged to the people of the country who, having imported the Bronze culture from elsewhere, were driven to the coast by another and more powerful race who occupied the interior, and that the defences under consideration were associated with their last occupation of the soil of Yorkshire. Further than that he did not venture to particularise. They had seen that notwithstanding the traditions which connected this place with the Danes, and notwithstanding the prevalence of a Danish element in the population of this county, this ground was the scene of the military operations of a much earlier people, who—though ruder in their culture—were much their superiors in the art of war, formidable in their means of offence and defence, and in the discipline necessary to construct the great works he had been speaking of.

ANCIENT DWELLINGS IN YORKSHIRE.

The Rev. E. A. Cole read a paper, prepared by Mr. J. R. Mortimer, giving an account of the discovery of six ancient dwellings found under water and near to British barrows on the Yorkshire Wolds. In the first dwelling it was evident that the work of construction had preceded the excavation of the trench, and was therefore older than the barrow. There were in the dwelling many streaks of burnt wood, a human femur, portions of an urn, and many animal bones. The second dwelling was within 30ft. of an oval barrow, in which were cremated interments. The third and fourth were of simpler construction, having no entrance passages, and consisted of nearly circular excavations in the rock, in which were found the bones of stoted deer and the urus. The fifth was of an entirely different type, consisting of an inner and outer circle of upright posts. In the centre of the two circles there was an oval grave, containing the flexed human remains of a large male. The sixth dwelling resembled the latter in its chief features.

CHEAP GAS FOR GAS-MOTORS.

Mr. J. E. Dawson read a paper on "The Economical Means of Using Cheap Gas for Gas-motors," in which he gave a description of an apparatus is referred to by us last week on p. 287, now in the Exhibition at York, for producing such gas. He said that the apparatus was small in size, easy to work, and gave a strong gas of uniform quality. For boiler and furnace work the gas could be used direct from the

generator; but where uniformity of pressure was essential, as for gas engines and burners, it should pass through a holder. The writer stated that a gas-engine driven with this gas would cost about 15 per cent. less than with the use of coal-gas at 3s. per thousand cubic feet, and about 17 per cent. less than a steam-engine. The most striking feature, however, he pointed out to be that with a steam-engine consuming 4lb. of coal per indicated horse-power, 217 tons of coal were required to give the same power as 32 tons converted into gas by this process, and afterwards used in a gas-engine. This represented an actual saving of 88 per cent.

Sir Fredk. Bramwell said that, having prophesied that in fifty years the steam-engine would be a thing of the past, he was glad to hear of another mode of utilising the energy residing in coal. The Otto gas-engine was an extremely useful machine, which could be worked with great economy; but the suggestions made by the writer of this paper bid fair to render the gas-engine still more economical. Unless great improvement was made on the steam-engine, there were many things to recommend the gas-engine. One was that it got rid of all possibility of boiler-explosions.

Mr. Heywood asked whether there was any way of getting a cheap illuminating gas by this process, as it would thus fill a great want. Mr. Dowson, in reply, said that he had not proposed to refer to the question of an illuminating gas, although he had succeeded by carburetting the gas in getting a lighting gas.

THE SERPENT MOUNDS ON THE SCOTTISH BORDER.

Dr. Phéné read a paper on "Scandinavian and Pictish Customs on the Anglo-Scottish Border." After adverting to the persistent retention of curious customs, and the handing down from generation to generation of the traditional lore of ages long past, the author of this paper referred to those which were corroborated by ancient monuments of an unusual kind still famous on the Scottish border. These consisted of sculptured stones, earthworks, and actual ceremonies. Quoting from former writers, from family pedigrees, and other documents, it was shown that the estates to which such strange matters, as follow, pertained, had been held alternately by those claiming under the respective nationalities or more local powers, and which, from their natural defensive features, must have been places of border importance earlier than history records. The district is occupied by the descendants, often still traceable—of Danes, Jutes, Frisians, Picts, Scots, Angles, and Normans; and by a comparison of several of the languages of these people, as well ancient as now existing, and also of the Gothic, it was shown in relation to a particular class of the most curious monuments, that the Norse "ormr," Anglo-Saxon "wyrm," old German "wurm," Gothic "vaurm," pronounced like our word worm; and the word "lint," or "lind," also German, and the Norse "liani," are all equivalent, and mean serpent; and in some cases the two words are united, as in modern German "lindwurm," and the Danish and Swedish "lindorm." On this apparently rested the names of some of the places having these strange traditions, as Linton or serpent-town, Wormiston or worm's (form's) town, Lillisham, the Furze serpent island, now Holy Island, &c., and also the various worm hills, or serpent mounds of these localities. It was shown that the contest like that of St. George was sometimes with two dragons, as shown on a sculptured stone in Linton Church, and on a similar stone at Lyngby in Denmark, in the barbyard, where there was a tradition that two dragons had their lair near the church. From these and other facts the author concluded that the contests were international; and in the case of two dragons, an allied foe, either national, religious, or both, was overcome. He showed from the Scottish seals, that Scotland used the dragon as an emblem, apparently deriving it from the Picts; that the Scandinavians also used it, and that these nationalities were antagonistic to the Saxon. In the time of David the First of Scotland the first great centralisation of Saxon power took place, and the powerful family of the Camyngs took, apparently by conquest, at least two of the localities having these traditions. And as the political object was to suppress the Celtic and Scandinavian or other local national feeling, there could be little doubt

that, however they obtained them, the persons dispossessed were of one or other of the Northern tribes. Hence, probably, the middle-age tradition of the slaying of the serpent or dragon, or the serpent or dragon bearer, on the Anglo-Scottish border. But he considered such traditions would hardly have originated through such conquests, had not previous marvellous stories existed of the prowess and conquest by the dragon (berrers) of the lands they invaded, all the wonders of which would be transferred to the conqueror's conqueror. Hence these stories were not to be set aside with a sneer, as in them was a germ of history, giving us, perhaps, the only insight we could obtain of the prehistoric customs and mythology of some of the ancient tribes of Britain. Earthen mounds, tumuli, standing stones, &c., still existed in some of these localities, with all of which the dragon serpent or worm was associated in the legends. The author then described his personal experiences in the still existing dragon ceremonies in the south of France and Spain, which were always either on the present national or former less important provincial frontiers, and which still formed the subjects of great ecclesiastical ceremonies. One of the high ecclesiastical dignitaries of the North of England—the Bishop of Durham—is in the position of having to take part in such a ceremony. Whenever a Bishop of that diocese enters the manor of Seokburn for the first time, the Lord of the Manor, who holds under the see of Durham, subject to the following tenure, has to present the Bishop, "in the middle of the river Tees, if the river is fordable, with the falcion wherewith the champion Conyers destroyed the worm, dragon, or fiery flying serpent, which destroyed man, woman, and child" in that district, and an ancient altar called "Greystone," still marks where the dragon was buried. The subject was illustrated with views of all the places referred to, on the Anglo-Scottish, French, and Spanish border countries, as well as drawings of the sculptures, funeral urns, and other antiquities belonging to each locality.

ON SOME OBJECTS RECENTLY EXHUMED IN BRITAIN OF APPARENTLY PHOENICIAN ORIGIN.

Dr. Phéné read a paper on the above subject. The places at or near which the objects were discovered were described as having in one case natural, in the other artificial, hillocks or tumuli of earth or stone simulating rude animal outlines. One of the localities was the vicinity of Dartmoor, the other that of the great serpentine mound, containing a chamber in the head, found by the author some years since not far from Loeh Ettive. In the first—Newton Abbot in Devonshire—had been found some years since, at a depth of 25ft. below the surface, leaning against a prostrate oak-tree, equally deeply buried, a rudely carved black oak figure, under two feet in height. At the last—North Ballachulish—a similar figure, nearly five feet high, including an attached pedestal. As to the simulation of animal forms, natural and artificial, both were referred to in America and in France, and in or near them in each such case had also been found figures somewhat similarly designed, but not in wood. But there were still existing figures in wood and stone of almost identical sizes and outlines in places long held by the Phœnicians, as Minorea, &c. A remarkable piece of evidently Assyrian sculpture found on Lord Mount-Edgcombe's estate in Devonshire, lent further probability, from its locality of once-Phœnician occupation, and necessarily of importation in exchange for export tin, of the object at Newton Abbot being made or imported by those people; and the bronze head of a cow found in a bog in Ireland, having the Phœnician emblems upon it, seemed a further example of their importation. The figure at North Ballachulish had a clearly Oriental feature. The eyes were formed of white stone inserted in the dark oak or ebony—and a recess at the base of the figure seemed evidently formed for a reliquary, and, with the sign of a crescent on the head, was pointed out by the author as a proof of its being an object for worship. This figure was also found at a depth from the surface indicating a date as far back as the Phœnician traffic; the thickness of peat under which it lay has been estimated at 12 feet. It was shown that North Ballachulish and Newton Abbot were both secure and therefore valuable harbours, and the gold of Sutherland and tin of Devonshire were sufficient inducements to attract

Phœnician traders. All the subjects were illustrated by drawings.

Mr. John Holmes called attention to a case of pottery from Cyprus, which was being exhibited in the Philosophical Museum. He would venture to say that three-fourths of that pottery was of Phœnician manufacture. Upon the oldest of that Phœnician pottery the serpent was distinctly marked, and there were figures like those exhibited by Dr. Phene. The section then adjourned.

UNDERGROUND WATERS.

In the Geological Section on Monday, the report of a committee appointed in 1874, with regard to the circulation of underground waters, was read by Mr. C. E. De Rance (of Her Majesty's Geological Survey), Secretary of the Committee. The results of the investigation of the committee show that the Permian, Triassic, and Jurassic formations of England and Wales are capable of absorbing from five to ten inches of annual rainfall, thus giving a daily average yield of from 200,000 to 400,000 gallons per square inch per day. The area occupied by the formations was, in round numbers—Permian and Triassic, 8,600 square miles, and Oolite, 6,600 square miles. These were capable of yielding 1,720 million gallons, and the lowest rate of absorption was 1,320, or united, affording a supply for 100 million people, or 39 gallons per head. Mr. De Rance then described the water-bearing conditions of the Yorkshire area.—Professor Prestwich, Dr. Wright, and Mr. Baldwin Latham having spoken, Professor Hull, the Chairman of the committee appointed to make the investigation, said that the results of its conclusion would be tabulated, and he believed they would prove of great value to men of science, engineers of towns, and all persons requiring water from underground sources.

EXCAVATIONS IN EPPING FOREST.

General Pitt-Rivers gave an account of some excavations in the earthwork called Ambresbury Bank, in Epping Forest. He said that there had in times past been much discussion respecting the camp in Epping Forest, owing to its being situated in the region in which it had been suggested that Boadicea made her last stand against Suetonius; but there was very little evidence to fix the place in connection with that event, which appeared to have been a great battle rather than a camp. The Epping Forest Natural History Club had taken the matter up, and it was at the request of its president that he had made some suggestions for the examination of the place. Within certain limits the investigation had established the age of the intrenchment, and that it was British; but if the society wished to settle the question whether the camp was erected before or after the Roman conquest, further excavation could alone decide the point.

ANCIENT BRONZE BUST, IMPLEMENTS, &c.

Professor Hughes submitted to the Anthropological department on Tuesday, a Roman bronze bust of a helmeted warrior, and pointed out that the face on the helmet was of a different type from that of the bust, being similar to that of the "Dying Gaul." The occurrence of that face on a Roman helmet had never before been recorded. Professor Hughes also exhibited some ancient bronze socketed spears from China, and made some remarks on a supposed inscribed stone near Llanerchymedd, in Anglesea, expressing the opinion that the marks were due to the structure of the stone itself.

THE TOWYN STONE.

Mr. J. Park Harrison gave a long description of some objects engraved on the Towyn Stone, expressing his belief that they were of late Celtic character, and that the rude figures represented articles which were deposited with interred human remains.

BRONZE IMPLEMENTS FOUND NEAR LEEDS.

Mr. John Holmes read a paper on certain discoveries of bronze implements in and about Leeds. He remarked upon the fact that the subject of bronze instruments was at present of great interest, as instanced in recent publications and research. He said the last discovery of a hoard was made at Carr Moor Side, near Leeds, in May last. These implements he exhibited, together with others, among which was a spear-head found at Thwaite-gate, at a depth of 20ft., in 1878. In 1846 a hoard was dis-

covered, in an unfinished state, at Churwell. These showed the process of casting, hammering, and finishing. He also exhibited other specimens found during the last forty years in a direct line of four miles. He likewise called attention to a fine dagger found at Lakelock in 1842, and a very significant celt found at Sandal Magna in 1852, of which Mr. J. Evans entertained a high opinion. Mr. Holmes compared this collection with implements found elsewhere, and said that the use and intention of these bronze implements was obviously two-fold, viz., weapons for offence, and tools for manufacturing purposes. He thought they might assume that at a time remote from the present, in the West Riding of Yorkshire, and within a circle of twenty miles south and east of Leeds, there dwelt a considerable number of bronze-using people, who probably lived in clans or tribes, and who roved on the hills and fished in the extensive lakes and rivers.

WIND-PRESSURE ON FIXED PLANE SURFACES.

In the Mechanical Section, over which Sir F. Bramwell presided on Wednesday, Mr. T. Hawksley read a paper upon "The Pressure of Wind upon a Fixed Plane Surface." The conclusion arrived at by him was that for structural calculations a maximum wind-pressure of 40lb. per square foot might be safely adopted, notwithstanding some common anemometrical observations to the contrary. With regard to these observations, the author remarked that the instruments in use were little better than philosophical toys; that in general they afforded no direct comparable or reliable indications in either velocities or pressures; and that they were often so injudiciously placed as in many instances to record the effects of combined and therefore locally accelerated currents, whilst in other instances they recorded only the effects of obstructed currents. As the acquisition of accurate data was of great and increasing importance, the author suggested that the British Association, and other learned societies interested in physical investigations, should unite in providing the necessary funds and observers for the purpose.—A discussion followed, in which Mr. G. J. Symons questioned the conclusion to which Mr. Hawksley arrived as to forty pounds per square foot as a maximum for wind-pressure being sufficient for structural calculations.—The President thought that engineers could not build strong enough to resist the greatest wind-pressure; all that they could do was to build their structures as strongly as they could.

ABATEMENT OF SMOKE IN LARGE TOWNS.

A paper was read by Mr. W. R. E. Collis on "Coals, and the abatement of smoke in large towns." The author said that the requirements of civilisation necessitated the greater use of heat agency, and statistics proved that the consumption of coal of the civilised nations of the world had largely increased, whilst the production both at home and abroad, notably in the United States, was also increasing. The production of coal in Great Britain in 1860 was 80,000,000 tons, and in 1880 149,000,000 tons. It had just doubled in thirty years, whilst in 1830 the production was only 10,000,000 tons. The use of coal for manufacturing purposes and the evils of smoke were described, and the author then referred to the suggestions which had been made that the development of electricity was likely to supercede the use of coal, both as an illuminating agent and a motive power. He, however, thought that although we might confidently look for an enormous development of the application of electricity as a motor as well as an illuminator, it did not appear at all reasonable to view electricity as an effective power dissociated from coal, and it would seem more accurate to look upon electricity, great as its value might be, as but an aid to the effective power of coal, upon the use of which electricity at present depends for its creation and application to every one of the useful purposes to which it was adopted. He believed that coal might be better utilised for all purposes, especially for domestic fires, both on economical grounds and in order to improve the sanitation and social comfort of our growing towns. A society had been formed in London to deal with the smoke nuisance by promoting improvements in the whole art and practice of heating, and as a practical measure an international exhibition of all the most modern heating appliances, suited both to domestic and industrial purposes, was to

be held at South Kensington. By this means it was hoped that much would be done to bring about a change for the better, and stay the present wasteful and injurious consumption of coal.

SOME OXFORD CHAPELS.

WE hardly know any buildings more completely *sui generis*, says the *Saturday Review*, than the typical Oxford College Chapel, such as the Chapels of New College and All Souls. We question whether the type referred to is to be found anywhere in England but at Oxford. As a rule, like causes produce like effects; and the circumstances of mediæval collegiate life were much the same at both Universities. But the builders at Cambridge contented themselves with the simpler plan of the unbroken parallelogram, the antechapel being formed by screening off one or two of the western bays. Even Henry VI.'s colossal chapel at King's is of the same unambitious type. It is one long hall from end to end, without aisle or transept. The side chapels are entirely external to the main walls, filling the recesses between the gigantic buttresses which sustain the vault. The Chapel of Jesus is a cruciform conventual church, adapted in the fifteenth century to collegiate use, and therefore finds no real exception. At Oxford, too, we find this simpler arrangement, as in the former chapel of Balliol, and those of St. John's, Jesus, and University; but the grander and more fully-developed type was evidently the favourite, and continued to be adopted from its introduction by William of Wykeham at New College, at the end of the fourteenth century, till the beginning of the 17th century at Wadham, and almost its close at Brasenose. At Queen's, also, we learn from Logan's bird's-eye view, an "outer chapel" of the New College type was added in 1518 to the simple oblong chapel of rich Decorated architecture finished in 1382, almost contemporaneously with Wykeham's buildings.

The plan of these buildings is, in block, that of a cruciform church, deprived of its nave, such as Merton Chapel at the present day, and of Bristol Cathedral before its recent completion. But the similarity is superficial. The western limb is no transept, but a very short nave of two bays, the apparent transeptal projections being formed by the aisles. If carried further westward to their normal length, these chapels would become churches, comprising an aisled nave and an aisleless chancel, of the common type. The superficial likeness to the arrangement at Merton, which is an unfinished building, consisting of the choir, transept, and central tower of a cruciform church, of which the nave was never built, has led some to the erroneous conclusion that Wykeham, struck with the convenience of this plan for collegiate purposes, adopted it with modifications in his Chapel at New. This theory, however plausible, is completely refuted by chronology. The buildings of Wykeham's "New College," more properly "Sainte Marie College of Wynechestre in Oxenford," the fulfilment of his grand design for raising the standard of education in England, were completed when on the vigil of Palm Sunday, 1386, the first warden and fellows entered on their new home. The cloisters, the last completed portion, were consecrated by Nicholas, Bishop of Dunkeld—one of Edward III.'s creatures, unrecognised by the Scotch Church—October 19, 1400. At this time Merton Chapel consisted of the choir only; nor was it till about seventeen years later that the suspended work was resumed, the transepts not being finished till 1424, when the whole was "rededicated with great pomp." The central tower is later still, dating 1448-1450. We may therefore safely ascribe the plan of this chapel to William of Wykeham. The great convenience of the spacious antechapel for the performance of the various functions, almost as much secular as ecclesiastical, of which college chapels were the appointed place in mediæval times, was self-evident. The college chapel, as Mr. Clark has reminded us, was the recognised place for meetings, acts, disputations, lectures, and even for dramatic performances. When Queen Elizabeth visited Cambridge in 1564, the "Aulularia" of Plautus and other plays were acted before her in the antechapel of King's, and that, too, on a Sunday evening. Ruggles's "Ignoramus" was performed in the same sacred precincts before her successor.

There is a survival of the custom even to our own day in some colleges, in the election of Fellows, the signing of leases, and the delivery of declamations on secular subjects in the chapel. Still, the incongruity between the sacred and the profane was less conspicuous when secular actions were transacted in an antechapel, separated by a screen from the chapel proper. The suitability of the plan is proved by its having been adopted successively by Chicheley at All Souls, and by Waynflete at Magdalen, as well as in the already mentioned additions at Queen's. It was also revived at a much later date (1613 A.D.) at Wadham—that remarkable and, at first sight, almost staggering reproduction of pure Perpendicular forms and details side by side with a composition of the most Debased character—where the two side-arches, dividing off the aisles of the antechapel, are evidently copied from those of New, and in less completeness at Oriel; and, last of all, in 1666, in that strangely heterogeneous, but not unpicturesque, medley of the Classical and Gothic styles at Brasenose. The former chapel of Exeter, built in 1624 (which has given place to Sir G. G. Scott's attractive, but somewhat tame, adaptation of the Sainte-Chapelle), a building remarkably good for its date, which we should have been glad to see preserved, had exceptionally the antechapel at the side, forming a south aisle, divided from the main body of the chapel by a row of pillars and arches.

It was a further recommendation of Wykeham's design that by this lateral extension of the antechapel the architectural effect of the western façade was greatly augmented, and the chapel assumed much greater dignity and importance than if it had terminated in a simple gable. No one can have noticed the grand effect of the west-end of New College Chapel, towering above the low cloisters, or that of Magdalen Chapel from Pugin's entrance gateway, without appreciating the feeling which dictated the arrangement.

The one modern chapel in which the typical Oxford plan has been in any way attempted is that of St. John's, Cambridge. Here, however, Sir Gilbert Scott has preferred the rudimentary Merton type. The western wings are real transepts, opening into the lantern space by broad single arches, and there is a tower which would have been central if the nave had been built. The effect is stately, but, as at Merton, incomplete.

The earliest colleges at Oxford, very humble foundations, had no chapel. The members worshipped in an adjoining parish-church. When chapels began to be added they were nothing more than small oratories. To Wykeham must be ascribed the introduction of the more stately ideal to which, after his time, most of the subsequently erected colleges sought to conform themselves. According to his arrangement, the two edifices essential for the common life of the society, the hall and the chapel, formed one continuous building standing end to end. At University and St. John's the chapel stands to the east of the hall, and an east window, that feature so specially dear to the English mind, was possible. This arrangement was also adopted by Hawksmoor in his stately Classical design at Queen's. But in the three earlier examples of New, All Souls, and Magdalen, either local circumstances or the caprice of the designer dictated another arrangement. The chapel is placed to the west of the hall and ends in a dead wall. The absence of an east window, however, instead of being allowed to be an injury to the architectural effect, has given an opportunity for adding greatly to its internal magnificence. The end wall afforded a field for that luxuriance of tabernacle work in which the architects of the Perpendicular Period revelled, and which may be regarded as the chief glory of the style. When fresh from the carvers' hands, every niche filled with its appropriate statue, the whole glowing with colour and bright with gilding, and rich with "busy entail," few more magnificent spectacles can have been presented than the reredoses of these chapels. The whole end-wall was the reredos, and the composition, rising tier above tier from basement to roof, displayed the combined skill of architect, sculptor, and colourist, at its highest and best, in a triumph of decorative art.

But while few of our mediæval architectural works can have been more deserving of admiration than these noble chapels, few have suffered

chapel represents very graphically the events of the creation of the world. In Square 1, the Almighty is seen with a huge pair of compasses marking out the world; chaos is all around Him, and in obedience to the command Let light be, light is streaming down from a great luminous fountain, in the presence of Deity. Squares 2 and 3 show trees coming into existence, and some animals. 4th. Birds are seen, and the Father's blessing is being given to the inhabitants of the waters. 5th. The creation of Eve is depicted; the bone in the Almighty's hand has drawn upon it the picture of woman. 6th. The Garden of Eden, with our first parents walking, and abiding with God, without fear or misgiving. Next, 7th. The temptation. A human-headed serpent deceives the woman, whilst Adam is partaking of the forbidden fruit, represented by a large golden pippin. 8th. The hiding beneath the trees of the garden; the cursed serpent, no longer disguised with the human countenance divine, as a dragon, is lying prostrate on the ground. 9th. The expulsion. Our first parents are, by the flaming sword, driven from the garden—Eve looking back, as if with desire, for the lost inheritance. 10th and 11th squares show us Eve, with the infant Cain on her knee, at a spinning-wheel, and Adam, as husbandman, is thrusting a spade into the ground by the aid of his naked and unprotected foot. The middle window of this chapel gives the history of Noah. 1st. Taking the animals into the ark: birds, of many kinds, amongst which is the dove; camels, lions, pigs, deer, goats, &c. 2nd. The Ark floating on the waters, Noah looking out at one of its windows, his wife at the other. 3rd. Noah is seen offering sacrifice, the kid or lamb, with crossed fore legs, is fastened on the altar as if to symbolise the Crucifixion. 4th. Noah, very beautifully painted in glass of a deep hue, is represented as digging in the midst of the vines. 5th. In another part of the window the Patriarch is prostrate on the ground, in his drunkenness, in the presence of his sons. In the same window is Abraham sending away Agar. Lot in the cave with his daughters. The Babel builders. The marriage of Abraham, and two squares in the centre of the window, represent in most marvellous painting, Esau and Jacob, before their patriarch father. In the most westerly window of the chapel, in the midst of much that is broken and despoiled, are shields held by Angels, containing—1st, An illustration of the Betrayal; 2nd, the Club or Staff crossed with bulrush; 3rd, the Lantern; 4th, the bloody Spear crossed with the Sponge and Reed; 5th, the Saviour blindfolded, the face lovingly painted, the beard and general contour of the face most delicately outlined; 6th, the *Three hands*, one plucking off the hair, the other with the open palm, smiting the blindfolded Saviour; 7th, are the Sacred monograms; 8th, Judas' purse overflowing with the thirty pieces of silver; 9th, the pierced hands, the pierced heart and feet; 10th, St. Veronica holding her legendary veil, on which is impressed the Saviour's likeness. In other parts of the church there are several more of these memorial shields, containing, in the following order, 1st, the Cock crowing; 2nd, the Crown of Thorns in a flood of holy nimbus; 3rd, the two Pikes, crossed; 4 and 5, the Ladder, the Seamless Coat, the Scourges, the Club and bloody Spear; and the Scourging post in form of a cross. In the great north window on other shields are represented the Hammer and Nails, the Pincers, and the Cross.

The great east window, the windows of the clerestory of the choir, the great west window, and others in different parts of the church, are more or less filled with glass, dating, without doubt, from the middle of the 15th century, making the time of the reconstruction of the church in the Perpendicular period. Prior John of Malvern helped greatly with these windows and a legend in Latin, believed to be by his mother, is in most of them. In the most westerly of the north clerestory windows of the choir, belonging to this period, is recorded the famous legend of St. Werstan, about which so much has been said and written. The window is still, for the most part, unbroken. This St. Werstan window has been so often described, and was so fully delineated by the late Mr. Albert Way, that it is quite unnecessary to do more than to call attention thereto. It forms a most interesting link in Malvern history, and but for it—the story of St. Werstan, who was in fact the founder of Malvern—would be almost a blank.

The lower parts of what is known as St. Werstan's windows are filled with paintings illustrative of the dedication and early history of Malvern's Norman Church. The window also contains what are believed to be large full-length portraits of the following eminent personages:—King Edward the Confessor, the good St. Wulstan, and King Henry I. Others of these clerestory windows have fine paintings of bishops and archbishops, the why and the wherefore of whose appearing is a matter of conjecture; but probably they represent eminent ecclesiastics who were, in a way unknown to us, connected with the monastery. Large figures representing the Annunciation are very choicely delineated in the most easterly of these windows, as are also four representations illustrative of the legend of Joachim and Anna, containing 1st, the Altercation in the Garden; 2nd, the meeting under the garden-gate; and the birth of the blessed Virgin Mary. In the most easterly of the south clerestory windows are designed illustrations of the four Latin Doctors, and scenes connected with the history of the Israelites, such as the gathering of the manna and the smiting of the rock, the manna being represented as falling in the shape of loaves of bread. In the middle window is the Crucifixion, in which angels are shown catching the shed blood. On one side St. John supports the fainting Virgin, and on the other the Centurion, looking on the Crucified One, exclaims "Truly this is the Son of God."

The great east window, also of 15th century date, tho' sadly broken, has many a charming picture. A beautiful Annunciation is at the top, a little lower down there are the twelve Apostles, and the emblems of the Evangelists. The entry into Jerusalem, and the Last Supper, are both very finely depicted. Following these are the Betrayal; the Nailing to the Cross; and the Appearance among the Doctors. The last picture is surrounded by the Scriptural quotation of "Wonderful, counsellor, the mighty God, the everlasting Father." All these pictures are unbroken, tho' in some cases they have been displaced. The confused mass of broken fragments of other pictures, filling up the remaining portions of this great east window, gives but a faint idea of its former magnificence.

In the great west window are usually large figures of the blessed Virgin and Child, and St. John the Baptist; St. Michael; St. George and the Dragon; St. Christopher; St. Nicholas and St. Catherine, with a great deal of fragmentary glass of interesting character.

In the great north window, the date of the construction of which is 1504 or 5, and which has been said to have been given by Henry VII., there are still remaining very bold representations of the most noble Prince Arthur, and Sir Reginald Bray. There are traces also of pictures formerly existing, of Henry VII., his Queen, and the Princess Elizabeth; but all except those mentioned figures have long since disappeared. This window also contains the Nativity, which as a picture is quite a study. The Salutation; the Visit of the Magi; Christ in the household of Martha, Mary and Lazarus; the opening of the Prison-house of Purgatory; and much of very fine fragmentary remains. In the west window of the north transept is a "Nativity," a beautiful "Last Supper." Large full-length figures of St. Paul, St. John, St. John the Baptist; a Pope's head, probably that of St. Gregory; a very beautifully designed Annunciation; Christ healing the sick, lame, and blind; the Presentation in the Temple, and much besides of beautiful broken glass remains.

These are but a summary of the beautiful paintings still remaining in Malvern Priory Church. Any one desirous to know more, may consult a little book on the subject, published some years since. But no mere description can afford anything like a clear conception concerning these windows, or do them justice; to be understood, they must be carefully examined.

GARWAY AND THE KNIGHTS OF ST. JOHN.*

IN a peaceful, secluded Herefordshire valley, on the confines of the county of Monmouth, lies the very ancient church of Garway, or

* A paper read by E. H. LINDEN-BARKER, architect, of Hereford, at the Malvern Congress of the British Archaeological Association, Aug. 26th, 1881, as noted on p. 291 ante. For illustrations and further description of the church, see BUILDING NEWS for May 13, 1881 p. 51b. Vol. XL.

Ellan Garewy, dedicated to St. Michael, and near to it are a few scattered fragments of what has evidently been at one time or another a religious house of considerable size and pretensions. It is commonly supposed to have been a preceptory of the Knights Templars, though possibly upon barely sufficient grounds; at any rate, I can find but little documentary evidence, and the architectural features may or may not point that way. With the exception of the tower, chancel-arch, and two of the eastern windows, which are all of undoubted Norman or Transitional date, there is nothing belonging to the church of an earlier period than the commencement of the 14th century. The Templars were expelled from Palestine in A.D. 1291, and were finally abolished by Papal Bull at the Council of Vienne in A.D. 1312. Amongst these ruins of what may have been a preceptory of their order is a remarkably perfect circular columbarium honeycombed for 666 pigeons, and on the tympanum of its southern entrance may be read even now (though every year unfortunately renders it more illegible) the following inscription:—"In the year of our Lord, 1326, this Dovecote was erected by Brother Richard." It is evident, therefore, that Brother Richard could not have been a Templar, because his order had ceased to exist some fourteen years previously. In all probability, however, he was one of the Knights of St. John, for the Garway Estates were without question in their hands twelve years afterwards, seeing that in the year 1338 detailed allusion to the property is made in the report of Philip de Thame, the Prior of the Order, in London, to its Grand Master at Rhodes, Elyan de Villanova. Silas Taylor, who lived about 200 years since, mentions having seen "stately ruins of a religious house at Garway," but these have now been taken down to build the present farmhouse and barns with, and the columbarium alone remains, a most valuable witness to show what the style of the remainder must have been, and the period at which they were probably erected. It is at present used for penning in sheep and pigs; but I am glad to say will shortly be restored to its original purpose upon a suggestion that I ventured to throw out in the proper quarter.

I now pass from the historical division of my subject to the architectural one, and propose drawing attention to some of the most interesting and puzzling features of a church which, but for its distance from Malvern, would, I am sure, have amply repaid a visit from the British Archaeological Association. The Cambrian archaeologists made a flying visit at the far end of a long day in 1857, but with this exception I cannot learn that it has ever been examined by a body of gentlemen capable of theorising in any successful way upon its many peculiarities; but I should mention that both the *BIRMINGHAM NEWS* and *Church Builder* have recently published some interesting illustrations of it.

Commencing at the west-end, the remarkable position of the massive Norman tower first demands notice. It stands 8ft. or 9ft. away from the N.W. corner of the nave, is 27ft. square externally, and 42ft. up to the roof, which is of a hipped character. The staircase appears to have been added about a hundred years afterwards, when I take it the bells were furnished. The lower portion of the wall is 5ft. thick, and the building was originally quite detached from the nave, the covered passage connecting the two being of evident 11th-century execution. There is a tradition that during the Border Wars it was used for a condemned cell, while the rest of the church served as a prison, and it is also reported to have been connected with the preceptory by an underground passage.

The nave possesses several ancient oak benches, the ends of which are as much as 4in. thick, and the seat-boards only an inch less. Behind the curved plastered ceiling I have been fortunate in discovering the original oak roof, consisting of arched ribs in excellent preservation, which of course it is hoped shortly to be able to restore. There is very distinct evidence of a doorway, and externally also of a porch once existing on the north side, and the latter must, from its covering a portion of the lancet window near it, have been added at a later period. The ground here is some 6ft. or 7ft. above the level of the interior, and in recently clearing the damp soil from the walls no evidence of either steps or burials were come across. It seems a little difficult to account for the selection of this

tie, Z, across the throat, to prevent its being pulled out of shape.

GO-TRAP MADE IN TWO PIECES. (Fig. 72).

First, you require a block the shape of your trap, or block in two halves, the seam being on the side (that is, if you have many to make), and two rings made in such a manner that they can

be slipped over the block and the lead, and with thumb-screws screw together, so as to hold the lead upon the block, while you are working it to the shape of the block.

Now for the size of your lead: Take a strap of lead, say, 4in. wide, and measure round the trap from MFD to A (Fig. 68). This will give you the length for the bottom. Now take the circumference of the trap to get the size. Half this will be the width for you to cut the lead, which must be cut truly, and with planed edges. Next, just where the lid is to fit D, take the mallet and hollow your lead a little, not to thin the lead, but just to fit the bottom of the block, then offer it on the block and end up the inlet end; take the ring and fix it on this part of the block. Next bend up the part from D to A, and with the other ring fix it there, then with your tools (a bossing-stick will do) work the lead to the shape of the block, taking care to drive the molecules of the lead in the direction you require them to flow, and be sure that the lead is of uniform thickness; in like manner do the throat or top part. Care must be used to hollow and fit the lead to as nearly as possible the proper shape, by first turning it back, and with the bossing-stick well drive up the throat part, C in plan (Fig. 68). This will thicken the lead; after which place it upon the block and bend over the back to the out-go, and with the rings fix it there, then work it to fit the block.

I have before said this should be in two halves; this will give you a line to trim your lead to, should you require it trimmed off for soldering.

The next thing to do is to solder it up, which may be done with the copper-bit, wipe it, or burn it. The last-named is much the best.

(To be continued.)

ADAMS' AUTOMATIC TROUGH FLUSHING CLOSET.

THE necessity for an efficient Automatic Flushing Closet has long been felt, and we believe that in the form introduced by Messrs. M. J. and S. H. Adams, of Leeds, this want is met.

The trough is made of the best fireclay, or is supplied in iron, to which a specially high glaze is given, both internally and externally.

It is readily fixed by any workman. It is so constructed that the full length is utilised for

seats, none being wasted by the valve-chamber as in the ordinary trough flushing closet.

When waste water from yard sinks, slop water, &c., is led into the trough, only a very

limited amount (if any) of other water is required for use in the after-flushing: where no such connections are made, the closet works with the amount of water usually allowed for such purposes by Water Companies (this being regulated by a plain ball-tap, unless otherwise ordered). The trough, when ready, discharges its contents by means of the patent siphon, which is fully charged on the instant. The siphon is equal to a 4in. pipe, and will therefore carry off all matter without the fear of choking. The closet will work without attention for an unlimited time. It may be built to any length. The cross section given herewith shows the construction.

THE PROMENADE EXTENSION AT SOUTHPORT.

LAST Wednesday Southport, the fashionable watering-place of Lancashire, was *en fête* on the occasion of the opening of the new markets and marine promenade. The Southport Promenade extension was commenced in 1879, at the beginning of which year our readers may remember the corporation invited architects to send in designs for extending the parade from the old promenade to Park-road. The result was that nearly seventy designs were sent in, and three designs were awarded prizes. The author of the successful design was Mr. G. Heaton, architect, of Wigau, but the work of construction has been carried out under the supervision of the engineer to the corporation, Mr. William Crabtree. From the plan of the reclaimed land before us, showing the suggested building-plots, we see the promenade extends in a northerly direction from Seabank-road close to the convalescent home, and returns to Park-road by a circular sweep at the north end. The triangular area thus reclaimed has been divided into plots of rectangular shape, intersected by roads, the main ones of which run from Adelaide-street to the promenade. A considerable building frontage to the water is thus obtained, giving 28 plots large enough for detached villas. These plots vary in area, the largest measuring 2,773 square yards in area, and the smallest about 1,000 yards. In all there are 144 plots of various sizes fronting good roads, intended for detached houses.

The contract which has been carried out included an embankment from Seabank-road along the line of promenade to its junction with Park-road, the making of approaches to the various abutting roads, and the embankments at the different junctions and at the convalescent hospital. The main embankment was formed in 18in. layers, and Portland cement concrete is largely used in the footings of the promenade and in face of embankment, steps, and splayed plinth. The proportion used for the rough work was one of cement to six of aggregates, and the face of embankment is finished with one to three. The cement was specified to be of the best quality from Messrs. White Brothers and Co., or from Messrs. Francis and Sons, it was to be finely ground and to weigh not less than 112lb. per struck bushel "when filled quietly from a hopper." The cement was tested by proper apparatus, and the requirements of the borough surveyor were fully detailed in the specification. When gauged neat it was required to set perfectly hard in water in seven

days, and a tensile strain of 600lb. on a cross section of 2½in. was expected. During the work the cement was regularly tested under the directions of the engineer, and a tabulated statement of the results kept; and all cement failing to comply with the conditions of the specification was rejected. Equal care was taken to insure good mortar; the lime from Halkin mountain, air fallen, was mixed in the proportion of two parts of lime to two of sand, and one part of hard smithy ashes or ground furnace-clinkers, and the whole to be ground in a steam mortar-mill. With regard to the composition of the concrete, the aggregates were required to be of clean gravel or broken clean grit or sandstone of the quality of the Parbold stone, the fragments being cubical, not flat or flakey; the sand added was to be of sufficient quantity with the cement and water to form a compact conglomerate, and the stone crushings and sand to form aggregates of six to one of cement. The concrete has been deposited in layers of 6in. thick, each being properly rammed.

The promenade thus embanked has a width of 60ft., and the upper plinth and steps are surmounted by cast-iron standards bedded in the concrete. The inner slope of the promenade embankment is two to one, and the reclaimed land is partly raised. The streets and roads are filled to the necessary height, and are 50ft. wide with slopes on each side, having batters of two to one. The approaches to the shore are covered with Haslingden sets 5in. deep, grouted solid with boiled tar. For the sake of durability and to resist the tidal action, the promenade along the north-east curve to Park-road is pitched with stone rough punched and grouted at the joints. The carriage road-way is formed with a foundation of hand-pitched stone to the proper contour 6in. deep, well beaten down, and wrecked with cinders covered with asphalt 4in. thick in two layers, each being well rolled. The asphalt is specified to be limestone from North Wales, broken to pass a 2in. ring and well mixed with distilled tar. The upper coating is of a finer quality, passing a ¾in. sieve.

We have no space to enter into further details of the work; the footpaths of promenade are paved with tiles 9in. by 9in., the open spaces are laid out for trees, and the improvement to this part of the town will be very great. Provision has been made for a storm outlet to be carried to a distance of 300 yards from the embankment, and great care has been taken to lay the sewer-pipes to prevent settlement on the newly-filled ground. The people of Southport will have every reason to be thankful for so useful a reclamation of their waste land, and there are other seaport towns which suffer periodically from the proximity of mud lands skirting tidal estuaries and bays which would do well to follow the example of Southport.

CHIPS

It is stated that a Warminster chemist has analysed the water from fifty wells in the town, and has found all to be polluted with sewage. It is supposed that over 500 persons use the water from these wells for domestic purposes.

A stained-glass window has been placed in Whinburgh parish-church, Norfolk, in memory of the late rector. Messrs. Barrauld, Lavers, Westlake and Co., of London, executed the work.

A new Cistercian church is to be dedicated at Mount St. Joseph, near Roscrea, by the R.C. Bishop of Killaloe, on the 18th inst.

A wooden pagoda is being added to the Cumberland Convalescent Institution at Silloth, to be used as a summerhouse and recreation-room by the male patients. Mr. C. Boyd is the honorary architect.

The Newport, Mon., School-board have adopted plans by Messrs. A. O. Watkins and Son, for the erection of the Alexandra Dock Schools, having 930 school-places, at an estimated cost of £3,000.

The greater part of the townhall at Sowerby-bridge is about to be reconstructed internally to fit it for use as an extension of the Joint Stock Bank. Messrs. Utley and Gray, of Halifax, are the architects.

The Wigton local board of health have decided to cover in their waterworks service reservoir at Red Dial, and to effect further improvements. The work will be carried out from plans and specifications prepared by Mr. J. S. Hodgson, C.E., of Hexham, under the superintendence of Mr. T. Tiffin, surveyor to the board.

TOWER OF HANDSWORTH THEOLOGICAL COLLEGE.—NEW CHURCH AT LONGTON.—HOUSES AT FURLEY PARK, CROYDON.—MUSIC-ROOM AT FLEET ST.—TOMB OF THE COUNT DE BORGNIVAL.—DOLPHIN INN AT HIGHAM.—OLD HOUSE, IPSWICH.

OUR LITHOGRAPHIC ILLUSTRATIONS.

TOWER OF HANDSWORTH WESLEYAN THEOLOGICAL COLLEGE.

IN the BUILDING NEWS for July 25, 1879, we published general drawings and plans of these new buildings now in course of erection at Handsworth. The design of Messrs. Ball and Goldard, the architects, were selected in open competition, in connection with which Mr. Alfred Waterhouse, A.R.A., acted as referee. The college accommodates 70 students, and the buildings are built in red brick, with buff terracotta dressings and purple brick diapers. The carved pitch-pine fittings for the library and lecture-hall were supplied by Jones and Willis, architectural art workers, Birmingham. The tower-rooms are to be used for science-class purposes, the upper part being intended for an observatory. The drawing which we reproduce to-day was exhibited in this year's Royal Academy Exhibition.

LONGTON CHURCH, LANCASHIRE.

THIS church, designed by Mr. J. Edward K. Cutts, of Southampton-street, Strand, is to be built on an addition to the churchyard, and in place of the present modern brick structure, the materials of the old church and of several adjacent cottages being used in the new building. The walls externally are to be of red brick with stone dressings. Internally all wall-spaces will be plastered, with a view to their being decorated, together with the roofs and ceilings, at a future time. The church will seat 500 people.

HOUSES AT FURLEY PARK, CROYDON.

THE row of villa residences, of which we give a view and plans to-day, show another endeavour to improve the class of suburban buildings by varying the elevations, and adopting a style in harmony with the character of the work. Simple materials are used. Mr. James Williams, of Bond-street, W., is the architect.

MUSIC-ROOM, FLEET STREET, CLAPHAM.

THE interior view which we publish to-day illustrates the new music-room lately completed at Fleet-street, from the designs of Mr. Arthur Cayton, architect, of Clement's-lane. The general colours for the walls are blues and browns, the woodwork being entirely of walnut. The panels of the ceiling are in blue flock on a clear gold ground, the enrichments having a delicate finish as well as sharp outline. The effect of the room is chiefly due to its harmony of colour. The arrangement of the room is in character with the rest, and the front has been made with this intention.

TOMB OF THE COUNT DE BORGNIVAL.

MR. W. R. L. is the Paris Travelling Student for the present year, and to-day we

publish one of the drawings which gained for him the distinction. It represents, in measured detail, the tomb of the Count de Bournival, from east now in the South Kensington Museum. The work is Flemish Renaissance, and is dated 1533. As a characteristic example of "Free Classic" work, it shows a freedom of ornamentation peculiar to the style, which cannot fail to be interesting to our readers.

"DOLPHIN" INN AT HIGHAM.

THIS is a very good specimen of Domestic work just outside Norwich, built, according to the date on the right-hand bay, in 1615, apparently on the site of an earlier building, as the hall contains a crenopied Decorated piscina. The house, though now degraded to the service of Bachelus, was formerly the residence of Bishop Hall, to whom there is a monument in the church in the form of a gilt skeleton. The material of the walls is flint rubble interspersed with pieces of stone, the end gable being finely diapered with brick, and the roof tiled.

OLD HOUSES AT IPSWICH.

THESE are simply ordinary dwelling-houses of the last century; but, from their quietness and breadth of treatment, are well worthy of notice. The lower-story has a brick front, painted white, in front of which the upper one projects with a fine shadow. This pannelled face is worked in plaster and is also painted white. The roof has red tiling. The effect of the square cornice over the round-ended bays is very good.

NEW RAILWAY WORKS AT NEASEN.

THE raising of the last principal of the roofs of Metropolitan New Carriage Works, Neasden, was celebrated by a dinner given at the White Hart Hotel, Willesden, proprietor Mr. T. B. Jones, which was served up in excellent style, and thoroughly enjoyed by all present. The chair was taken by Mr. Jackson Gawith, doctor to the works, the vice-chair by Mr. Thomas, foreman; several representatives of the Metropolitan Railway Company and others employed by the contractor attended, and the evening was spent in a convivial manner. The expense was defrayed by a liberal donation from Mr. Garlick, the contractor, and from several tradesmen and others.

These works are on an extensive scale, comprising carriage repairing and painting shop, 194ft. by 163ft., by 36ft., up to gables; the roofs are of four spans; the walls are of brickwork, faced with paviers, supplied by Messrs. Nash, of Slough; roof-principals of iron, supported on girders and columns; the roofs are covered with slates and glass; the floors are of wood blocks and concrete. The buildings are heated with exhaust steam, conveyed through the sheds in 5in. and 7in. pipes. When completed, they will be fitted up with the most modern appliances; there are also stores 208ft. by 13ft., by 40ft. high, and sawmill 136ft. by 55ft., by 50ft. high. Already 50,000 cubic yards of excavation have been removed. The contract has taken 10,000 yards of concrete, 2,000,000 bricks, 350 tons of iron, 400 squares of roofing, and 1,400 tons of lime (supplied by Messrs. Graves, Bull, and Lakin, of Warwick).

The first brick was laid on Feb. 15, 1881, the last on the 15th ult.; the last principal was lifted on same date. The plans were prepared by the Company's engineer, Mr. J. Tomlinson. The contractor for the work is Mr. J. Garlick, Sitley Works, Birmingham; the quantities were supplied by Mr. Brede; the clerk of works is Mr. John Winstone, and manager of the works, Mr. Henry Charlton, the whole having been carried out under his personal supervision. The cashier was Mr. Clere. The contractor had to construct 3 miles of railway, and to keep a locomotive in constant work. The time for completion was Oct. 31st, 1881; total cost about £30,000. An addition to these works is contemplated, comprising loco., carpenters', signal, copper-smiths', and running sheds; also offices and gas-works, &c. When completed, they will rank among the largest works of the kind in or near London.

The Sittingbourne highway board last week elected Mr. F. W. Collard, a Borden farmer, and a member of the board, as district surveyor, at a salary of £150 a year, in succession to Mr. Kerman, resigned.

CUMBERLAND AND WESTMORELAND ANTIQUARIAN SOCIETY.

THE second meeting and two days' excursion for the present season of this society was held on Tuesday and Wednesday week in West Cumberland. On the Tuesday the members met at Egremont, and proceeded by carriages, the first stopping-place being the ruins of Calder Abbey. Canon Knowles said the earliest work here was the west door, and a few small fragments elsewhere, which were in the Transitional Norman Style, c. 1170. The tower-walls proved that a clerestory was actually built, while a lower roof-line showed with equal clearness that it was afterwards destroyed, and that this great church was covered over in its mutilated state. The church was nearly finished in the 13th century, not much later work being visible. Mr. R. S. Ferguson, F.S.A., showed a large cresset stone which had been found on the site, and mentioned that only the other day a similar one was discovered in St. Catherine's Chapel at Carlisle. At the modern church of Calder-bridge, the vicar said the super-altar was one removed from Calder Abbey; he identified it with one granted by Pope Nicholas V., and consecrated by the Archbishop of York c. 1448 to 1451. In Gosforth churchyard, a sculptured cross was seen, which Dr. Parker considered to show lingering traditions of the Lindisfarne School of Art, and to be of the Norman period. Mr. Jackson pointed out that the interlacing treatment was of a kind very common in the Isle of Man. Near Seascale Hall, a halt was made to view a site near a stream, which Mr. Robinson, of Maryport, has been excavating in the expectation of finding traces of a Roman camp—at present, no success has rewarded the explorer.

In the evening, a dinner and business meeting were held at Egremont. At the latter the Rev. W. S. Calverley read a paper on "Early Christian Monuments in Brigham and Dearham Parishes," these consisting of three crosses, a cross-socket, and a font. Three papers were read on "Old Church Plate in the Deaneries of Gosforth and Wigton, and in the Parish of Maryport," the only examples noted as older than the 17th century being an Elizabethan Communion cup and cover at Hale Church, dated 1571-2.

On the second day, Wednesday, several papers were read after breakfast, including one written by Mr. G. T. Clark, F.S.A., of Dowlais, on "The Mediæval Defences of the English Border;" another by Mr. T. L. Banks, architect of Whitehaven and London, on "Old Egremont Church," an edifice recently pulled down and rebuilt from the author's design. The ruins of Egremont Castle were afterwards visited, and described by Canon Knowles. The site was probably, he thought, that of a hill fortress, then fortified by the Romans for a watch-tower to their Egremont camp, then built on by the Norman lord, harried by Scotch invaders and rebuilt. After being neglected for a long time, it was ruined by a Parliamentary coup de grâce, and for two centuries was the prey of the builder and the sport of the builder, but the wreck was still a noble one. At Walls Castle a little to the south of Ravensglass Railway Station, the members visited the remains of a Roman villa, which are being excavated by Mr. Joseph Robinson, of Maryport, to whom, and to Mr. Jackson, are due the honour of discovering and clearing these remains. The ground is a hard clay, and is partly paved with tessellated work, and there is also a hypocaust still in position.

In the afternoon the members went to the Muncaster Castle, where, amongst other interesting objects, Lord Muncaster showed "The Luck of Muncaster," a small glass vessel, now carefully preserved in a wooden box lined with wool. The bowl is said to have been given to Sir John Pennington, by Henry VI., after the Battle of Hexham, with the wish that so long as the bowl remained in the family unbroken, so long might the luck of Muncaster flourish. Mr. R. S. Ferguson pronounced the bowl to be Old Venetian glass.

The corner-stone of a new Unitarian schoolroom was recently laid in Friars-street, Ipswich, adjoining a chapel. The building will be of red brick, with Portland stone dressings, and will measure internally 50ft. by 22ft. Mr. C. A. Wyatt, of Ipswich, is the builder.

THE INNER CIRCLE RAILWAY.

ON Monday another important step was taken towards the completion of the Inner Circle Railway in the formal commencement of the works of the underground line between High-street, Aldgate, and Trinity-square, near the Tower. The ceremony of turning the first sod was performed by the Lord Mayor, M.P., on the invitation of the chairman and directors of the Metropolitan Railway Company. At present, the Inner Circle scheme is only carried as far as the Mansion-house station of the District Railway on the one hand and the Aldgate station of the Metropolitan Railway on the other, but the work initiated on Monday will continue the railway system of the last-mentioned line as far as Tower-hill, leaving then only the gap between that spot and the Mansion-house to be cleared and tunnelled to entirely complete the much-required circuit of communication between all parts of the metropolis, and indirectly between London and the entire kingdom. The section of construction begun on Monday will be, it is hoped, entirely perfected within six months, and assuming a speedy and final settlement, between the joint committee of the Metropolitan and District Railway Companies and the City Commissioners of Sewers and the Metropolitan Board of Works, of the terms for the construction of a wide new street between the Monument and Tower-hill simultaneously with the underground railway, the whole scheme will be at length concluded in 18 months from this time. There is every prospect that this financial adjustment will be made within a few weeks, the formal consent of the Metropolitan Board of Works to the reopening of the negotiations and the renewal of their former offer to contribute half a million from the rates towards the great cost of the undertaking being alone needed, and there is no doubt that it will be cheerfully given. It would be useless, now that, at last, an amicable solution of the difficulty has been arrived at, to narrate the details of the many failures in the negotiations as to terms between the railway companies and the two public bodies representing the ratepayers. The rock upon which the various proposals came to grief was the reluctance of the Corporation and the Metropolitan Board of Works to undertake the provision of an indefinite sum towards the enormous expense of the works. The Metropolitan Board of Works made a final offer of £500,000, and the City Commissions of Sewers of £250,000, but this the companies declined; the matter has now been satisfactorily arranged by the increasing of the contribution of the citizens from £250,000 to £300,000 and there is no longer any difference between the public bodies and the companies, but, on the contrary, an earnest wish by them all that a work so important and so vastly needed should be carried to completion without the slightest possible delay. The instalment of work begun on Monday will commence at Aldgate station and go thence underground from High-street, Aldgate, into the Minories at Church-street, down the Minories to John-street, then, turning slightly to the right, under the viaduct of the Great Eastern Railway, through the centre of the Crescent in the Minories, and thence under Trinity-square to Seething-lane, where it will terminate. The final, and, if possible, more important, work will include an underground line under Tower-street, Eastcheap, King William-street, and Cannon-street to the Mansion-house, completing the circle. In order to carry out this latter scheme all the houses on the south side of Eastcheap will be removed, so as to gain a width of 60ft. for the new street or avenue from the Monument to the Tower. The houses on the north of Great and Little Tower streets will also be pulled down for the purposes of this important thoroughfare, which, when finished, will open a direct line of carriage traffic from Westminster-bridge to the Tower. Both the railway and the street improvements are to be undertaken by the railway companies, the public bodies contributing the fixed sums already mentioned in sectional payments from time to time as the works progress.

JAPANESE PORCELAIN PAINTING.

JAPANESE porcelain painting may be divided into two categories, decorative and graphic. The first, according to a paper in the *Society of Arts Journal*, is used to improve the vessel upon which it is placed, and this class includes all the

ware except that of the province of Kaga, which would come under the head of graphic, as it delineates all the trades, occupations, sports, customs, and costumes of the people, as well as the scenery, flora, and fauna of the country. "Owari ware" is made in the province of that name; it is not as translucent, but stronger and more tenacious, than some of the Hiizen manufacture. The principal potteries are at a village called Scto, twelve miles from the sea; in this village there are more than 200 kilns. The ware is mostly painted a cobalt blue, and is merely of a decorative kind, consisting of branches of trees, grass, flowers, birds, and insects, all these being copied by the artist from nature. All the Owari ware is true hard porcelain, and is strong and durable. In Hiizen, a number of wares are manufactured, the best known kind being the "Eurari," which is made at Arita, but painted at Eurari. The colours in use are red, blue, green, and gold; these are combined in various proportions, but, as a rule, the red predominates. Generally, the surface of the vessel is divided into medallions of figures, which alternately have red, blue, or white background, with figures in green or blue and gold. The eggshell porcelain sold at Nagasaki is made in this province from Arita clay, and this is made from clay with no admixture of fusible matter except that contained by the clay naturally. The province of Satsuma is noted for crackled ware. It is only within a very few years that large vases have been manufactured, and in earlier days the old ware was confined to small vessels. The glaze is a silicate of alumina and potash, and the best ware has a complete net-work of the finest crackles; the painting is of birds and flowers, and noted for its delicate lines of green, red, and gold. In Kioto the ware manufactured is very similar to that produced in Satsuma, but it is lighter and more porous; the decorations are also nearly the same, being of birds and flowers. There is a description of ware made in Kioto, called "Eraku," the whole body of which is covered with a red oxide of iron, and over this mythical figures of gold are traced. That produced in Kaga is *faience*, and in the style of painting is unlike any other in Japan, the predominating colour being a light red, used with green and gold. The designs with which it is profusely decorated are trees, grasses, flowers, birds, and figures of all classes of people, with their costumes, occupations, and pastimes. The "Banko" ware is made at the head of the Owari Bay; it is an unglazed stoneware, very light and durable, made on moulds in irregular shapes, and decorated with figures in relief. On the island of Awadji, a delicate, creamy, crackled, soft paste porcelain is made. The figures used in decoration are birds and flowers, but outlined by heavy, dark lines. Consul Van Buren is of opinion that, at no distant day, Japan will be one of the foremost competitors in the pottery markets of the world, on account of the great variety and excellence of the clays, their proximity to the sea, the cheapness of labour, and the beauty and originality of the decorations. Already this important industry has been greatly stimulated by the foreign demand, and by the success of Japanese exhibitors at the exhibitions of Vienna, Philadelphia, and Paris.

NEW WEST-END THEATRES.

TWO out of the three new theatres which have for some months past been in course of erection at the West-end, are rapidly approaching completion, and are intended to be opened within the next fortnight. The "Beaufort," in the Savoy, which has been erected for Mr. D'Oyley Carte, and which we have already illustrated, is to be opened on Friday, the 16th inst., and, preparatory to its opening, wood-paving is to be laid down in Beaufort-buildings, at the cost of the owner of the theatre. The theatre has two main frontages, one at the south side, facing the Thames Embankment, and the other in Beaufort-buildings. The height of the structure from the ground-level in Beaufort-buildings, and also the south frontage overlooking the Embankment, is limited; but these external features give no indication of the internal area, or altitude from the pit to the ceiling. From the Strand, or north boundary of the theatre, there is a considerable descent in the roadway along Beaufort-buildings, and, with the view of providing both stage and auditorium space, excavations have been made in the building over

the entire area of the interior, to the depth at the north end of almost the height of the external walls themselves from the street level, with proportionate excavation at the south end. This permits of a spacious stage and stage dock beneath it at the north end, together with a large and convenient auditorium, including pit, stalls, lower and upper circles, and gallery. The carriage and principal approach will be from the Embankment and along Savoy-hill, but there will likewise be approaches for pedestrians on the east side from the Strand. Mr. C. J. Phipps is the architect of the theatre. Mr. Alexander Henderson's new theatre at the corner of Panton-street and Oxendon-street, Haymarket, is likewise making rapid progress, and it is stated that the opening night will be on the 1st of October. Like the Beaufort, the external features of the building do not represent its internal capacity, the audience and stage portions being both, to a large extent, obtained by excavating several feet below the street-level. The building, a portion of which is said to occupy the site of the house in which Addison wrote his poem of "The Campaign," is designated the Alexandra Theatre. Mr. Verity is the architect. The construction of the Avenue Theatre, for Mr. Sefton Parry, at the bottom of Northumberland-avenue, is being actively pushed forward. The site of the theatre is at the angle of Northumberland-avenue and Craven-street. In accordance with what is understood to be the stipulation of the Metropolitan Board of Works—that all buildings in Northumberland-avenue are to be faced with stone—the theatre will have handsome elevations in Portland stone, with a considerable extent of ornamental carvings. In addition to the elevation immediately facing the avenue, there will be another frontage to the Embankment, circular in form. The building has already been carried to a height of several feet above the ground-line. Messrs. Fowler and Hill are the architects.

ASPHALTUM.

THE use of asphaltum was frequent in ancient works. We hear of its being employed to cement together bricks, as in the walls of Babylon, which were built of bricks set in hot bitumen. The Egyptians used it in embalming the dead, and it is known that a substance is obtained from Egyptian tombs for preparing a pigment called "mummy." It is recorded also that the old painters used a preparation of this substance for glazing their pictures. Mrs. Merrifield, in her "Treatise on Painting," notices the subject, and alludes to the pictures of Titian, which are said to have been glazed with asphaltum; the shadows were put on with it. Cima da Conegliano used it also in the shadows, and Tintoretto employed it largely. It is quite certain the art of using it as a pigment is now all but lost; the bitumen must be very pure. As a material to warm and glaze other colours asphaltum is a very useful addition to the painter's palette, and it may be employed with advantage in broad surfaces, backgrounds, and draperies. For the glazing of dark colours mere transparency is a valuable quality. There are few materials more desirable; but its liability to crack is well-known, and a particular manner of employing it in thin coats is necessary.

A NEW COLLEGE OF PRACTICAL ENGINEERING.

A NEW College of Practical Engineering has been opened at Muswell Hill, near London, under the auspices of a number of the most eminent practical engineers in the kingdom, among whom we may mention Sir John Anderson, late chief engineer at Woolwich; Sir Henry Bessemer, inventor of the Bessemer process; Sir R. M. Stephenson, founder of railways in the East; Sir John Whitworth, Bart., founder of the Whitworth Scholarships; Mr. Charles Manby, honorary secretary of the Institution of Civil Engineers; and a great many more—men recognised as among the most eminent living practitioners in the different departments of engineering art which they severally adorn. The principal of the college is Mr. John Bourne, C.E., well known by his works on the steam-engine and other kindred subjects. The instruction given will combine the best theory with the best practice, and the establishment of this Col-

lege will, it is expected, constitute an epoch in engineering history. One main distinction which its teaching will present is that there will be no *examinations*, and that everything taught will be permanently and practically useful. Another special feature will be that a number of treatises illustrative of engineering art will be produced at the College, forming together an engineers' library. In furtherance of this undertaking the valuable stores of practical information accumulated at the Institution of Civil Engineers will be made available, and selected students will be adopted as *collaborators* in this important work and their names published, whereby their attainments will be made so widely and so favourably known as to constitute a valuable credential during their whole subsequent careers. Mr. Bourne's engineering works have not only gone through numerous editions in this country, but have been translated into all the languages of Europe, and are used as textbooks in many technical colleges both at home and abroad. The hands of the students will be educated as well as their heads. They will be taught how to work accurately in wood and metal, and when their two years of instruction terminates they may be expected to be real acquisitions to any engineer's office or factory they may enter.

THE SURVEYORS' INSTITUTION.

THE following explanatory statement has been forwarded by the council to the members of the Institution.

The council have the pleasure of informing the members that the Institution of Surveyors has now been incorporated by Royal Charter, under the above title, by Letters Patent under the Great Seal.

The president and council in office at the date of the Charter are thereby appointed the first president and first council of the corporate body, and are to hold office until the promulgation of the new by-laws, which are to be agreed upon by the general body of members, and submitted for approval to the lords of the council, within a time specified in the Charter. The constitution of the council and their powers remain substantially unchanged. All rights of existing members are carefully guarded, and their previous status secured in the reclassification for which the Charter provides. Members of the institution will, in future, be denominated Fellows, with the right to use the designatory letters F.S.I. after their names. The class of Associates are to be subdivided into two classes, Professional Associates and Associates. Present Surveyor-Associates are to be placed in the former of these two classes and are accorded the right to use the distinctive letters P.A.S.I. after their names.

Provision is made for the gradual introduction of the system of examinations for all classes of members which has already been fore-shadowed in the Education Scheme for Students, in operation for some time past. Students will be called upon to undergo an examination at the commencement (and if they desire to become professional associates, another examination at the close of their student course. Persons will, as heretofore, be eligible for election to both classes of Associates, without examination, till a date specified in the Charter, and to the Class of Fellows (also without examination) till a further date. After the latter date there will be no admission to the class of Fellows or Professional Associates without examination, the dates being so fixed as to afford the fullest opportunity for all surveyors at present in practice, or at present qualifying themselves for practice, to join the Institution without the ordeal of examinations.

It follows from these provisions of the Charter that in course of time the class of Fellows will be almost wholly composed of persons who have passed by examination through the classes of students and professional Associates; but it will at all times be open to surveyors (though probably with less facility) to pass direct by examination into the class for which they are in other respects eligible. The Council are to renew each year the certificates of membership of each Fellow and professional Associate, on such conditions and on the payment of such subscription as by-laws prescribe.

All administrative details are left to by-laws, but all changes in the by-laws must be submitted for approval to the Lords of the Council,

and, if allowed, be published, with the form of allowance, in the Gazette.

The following (elected members of the council in May last, and who are representative of the profession throughout the country) are nominated in the charter as the first council of the new corporate body—viz., E. Ryde, Westminster (President for the year); T. Smith Woodley and F. Huskinson, Notts; W. J. Bendel, London and Essex; E. P. Squares, London and Wilts; T. Bunnie, Glasgow; V. Buckland, T. C. Clarke, H. J. Castle, E. N. Clifton, J. Clutton, R. C. Driver, E. L'Anson, C. J. Shoppee, C. Stephenson, F. Vigers, and D. Watney, of London; W. Fowler, of Birmingham; James Martin, of Boston; W. Searth, of Darlington; and W. Surge, of Bristol; with R. B. Grantham, C.E., and F. M. White, Q.C., as associates of council.

THE LATE MR. CHARLES GRAY.

THE death of this gentleman, on the 1st inst., at the age of 53, will remind many of our readers of the origination of the Architectural Association, in which, five-and-thirty years ago, he took a prominent part, being, we believe, its first honorary secretary. Mr. Gray started in practice some years afterwards with considerable promise and much activity. Several buildings which he erected at the corners of streets in the Covent Garden neighbourhood, to be occupied as chambers, attracted much attention at the time by their bold and original treatment in brickwork. It is to be regretted, however, that the architect's enterprise led him into financial speculations in connection with these and other buildings, which resulted in ruin, and he has now passed away, leaving a family unprovided for. The members of the Architectural Association, in particular, owe a great deal to the memory of Mr. Gray. At the time when a letter bearing his signature appeared in a professional journal, calling attention to the lack of means for acquiring architectural education, and leading eventually to the establishment of the Association, he was only 18 years of age; and the energy thus early manifested was long continued in the service of the society. In competition work, Mr. Gray is understood to have taken his part with considerable credit, and in the well-remembered contest for the Memorial Church at Constantinople, his design received honourable mention, proving that he had in him the making of a better man if fate had been less unkind.

THE SECONDARY STRAINS IN IRON STRUCTURES.*

THE calculation of strains in triangulated systems (girders) is generally performed as if the bars were joined at their ends by hinges offering no frictional resistance; so that, when the system deflects in consequence of the lengthening and shortening of the bars, the angles of each triangle change accordingly, the bars retain their condition of being straight. This is not the case in reality, especially in girders with riveted connections. The bars are compelled on the one hand to retain their angles towards each other at the junctions, and on the other to follow the altered positions of the corners of the triangles, the consequence being the bending of each bar with generally one point of contrary flexure, and the occurrence of transverse strains (secondary strains) in addition to the axial strains (primary strains).

If S be the axial or primary strain in a bar, F its sectional area, J its moment of inertia, r the distance of an extreme fibre from the neutral fibre, and M the bending moment, then X , the maximum strain, is—

$$X = \frac{S}{F} + \frac{M}{J} \quad \dots \dots \dots (1)$$

If further a be the length of one side of a triangle, σ_1 and σ_2 the projections upon it of the other two sides σ_3 , σ_4 , σ_5 , the rates of changes of length of the corresponding three sides, h the height of the triangle measured from a , then the change of the angle opposite a is:

$$\Delta a = \frac{1}{h} (\sigma_3 \sigma_4 - \sigma_1 \sigma_2) \quad \dots \dots \dots 2$$

If finally τ is the angle which the end of a

bar in the bent state forms with the straight line between the ends of the bar (deviation angle) so that τ_1 and τ_2 are the two deviation angles of a bar having a length = l , a moment of inertia = J , and a modulus of elasticity = E , then the moments at each end of the bar are:

$$M_1 = \frac{2EJ}{l} (\tau_1 + \tau_2) \quad \dots \dots \dots (3)$$

$$M_2 = \frac{2EJ}{l} (\tau_1 - \tau_2) \quad \dots \dots \dots$$

The process of calculating the strains is now as follows:—By means of equation (2) all the angles in the system after the deflection are ascertained, assuming that the bars remain straight; then, since the angles between the bars at their ends remain unchanged there would, in the expressions for the deviation angles of the bars of the same junction, be only one unknown quantity, viz., the deviation angle (τ) of one of the bars. By applying these equations (3) to each bar at one point of junction, and considering that the aggregate of the moments for that point must be = 0, and, by doing the same for each point of junction, so many equations are obtained as there are unknown deviation angles τ . By putting these values into equations (3) all the moments are ascertained, and consequently by means of equation (1) the strains are found. This solves the problem. For the calculation of examples, equation (1) can be brought to the following form:—

$$X = m \frac{r}{h} k \quad \dots \dots \dots (4)$$

where k is the primary strain, h the depth of the girder, r the distance of an extreme fibre from the neutral fibre, and m a coefficient dependent on the geometrical conditions of the structure. The formula establishes at once the rule that the bars in a girder should not be too broad. Calculating m for various examples, the author finds a number of results, some of which are as follows:

Warren girder—single system, broad flanges and narrow diagonals (i.e., measured in the vertical plane); m (for flange) = 2; m (for diagonals) = 6 to 12.

The same—narrow flanges and broad diagonals; m (flanges) = 1.0 to 1.4; m (diagonals) = 5 to 14.

Panel girder—single system, broad flanges; m (flanges) = 2; m (diagonals) = 8 to 14; m (verticals) = 17 to 20.

The same—narrow flanges; m (flanges) = 10 to 23; m (diagonals) = 1.7 to 3.4; m (verticals) = 3 to 5.

Putting m into equation (4), it is found, for example, that the secondary strains in the end vertices of panel girders may amount to 30 or 35 per cent. of the primary strains; and further, as a general result, the panel bridges contain greater secondary strains than Warren or lattice girders.

Lattice girder—parallel flanges, double system; diagonals free at crossings. This is generally under similar conditions as the girder with a single system, but at the ends the secondary strains amount to about 40 per cent. more.

The same—diagonals rigidly fixed. The secondary strains are in the centre about 13 per cent., and at the ends about 70 per cent. of the primary strains. This is very much increased if only one system is loaded—viz., in flanges to the 3.5 to 12 fold, and in the lattice-work to the 2.5 to 5 fold; but if additional narrow verticals are introduced, the strains are the same as if both systems were loaded.

Girders with polygonal flanges are advantageous on account of the diagonals and verticals being narrow. The secondary strains in parabolic girders with single system amount to only 8 to 12 per cent.

Systems with hinged connections. Here is:

$$X = \frac{1}{2} f \frac{d^2}{r^2} k,$$

d being the diameter of the pin, r the radius of gyration of a bar, and f the coefficient of friction. For rectangular sections and $f = 0.16$

$$X = 0.21 \frac{d^2}{r^2} k.$$

This, applied to some existing bridges, gives secondary strains not inferior to those with riveted connections; but the advantage of pin connections is that the vibrations from the moving load probably overcome the friction to some extent, and that consequently the

* By Dr. E. WISSER. From "Deutsche Bauzeitung" for Abstracts of Institution of Civil Engineers.

secondary strains due to the fixed load need not be taken into account. In bridges with riveted connection an artificial mode of erection would be required to produce a similar result.

ARCHÆOLOGICAL.

AMERICAN ARCHÆOLOGY.—The fourth biennial congress of the students of the above science will be held at Madrid from September 23 to 28, inclusive. The congress meets under the patronage of King Alfonso and of the municipality of Madrid, and strangers will have a rare opportunity of examining the various interesting museums and collections in the Spanish capital. The lineal descendants of Montezuma and Columbus will preside at some of the meetings.

CHESFIELD.—While digging the foundations for a house about to be erected at Chesfield, Lower Teddington-road, Hampton Wick, the workmen have brought to light some interesting remains, consisting of several earthen vessels or urns, rudely fashioned, and filled with animal charcoal and calcined bones, but whether of human beings or animals is at present uncertain. Most of the vessels crumbled to pieces on being exposed to the air, but two are preserved almost entire. They are about 12 in. in height, have evidently been formed by the hand—not by the lathe—and are ornamented with a border and rude handles. They were found at a depth of about 10 ft. from the surface, and as no implements, either of flint or metal, have been discovered, it is probable that these relics date from a very early period, even before the Roman occupation of this island. Urns of unbaked clay of a similar form and character have been discovered in the barrows on Salisbury Plain, but in their immediate neighbourhood were found beads of glass and amber, heads of spears, swords, and brass articles; in some of those barrows were also discovered the burnt bones of dogs, fowls, horses, and other animals. As no metal or even flint implements have been discovered at Hampton Wick, it seems probable that these remains belong to a period more remote than those which were found in the barrows on Salisbury Plain.

A RELIC OF THE CIVIL WARS.—A very curious and remarkable seal has recently been found on Washcommon, the scene of the first battle of Newbury, Sept. 20th, 1643, near the spot where the Falkland Memorial is erected. The seal is circular, and made of brass, measuring lin. and 8-10th in diameter. It bears the device of a skeleton, with the surgeon's knife in the dexter hand, and an hour-glass on the sinister side. The legend with which it is inscribed is as follows:—"THE SOCIETY AND LOYALTY OF CHYRURGEONS HALL LONDON." This seal is supposed to have been used by the surgeons belonging to the Chirurgeon's Company of London attached to the Royal army at Newbury, and it was probably lost in the encounter.

CHIPS.

An elaborate memorial has just been placed in the east wall of the nave of Luddenden Church, to the late Mr. and Mrs. Appleyard, of Clare Hall, Halifax. It consists of a semi-octagonal recess of Caen stone with pierced and projecting canopy; on either side is an angle buttress with crocketed pinnacles. Within is an angel carved in white marble and bearing an inscribed shield. The figure is the work of Mr. E. J. Boehm, A.R.A., the stonework of Mr. Terry, of North Brixton, and the execution of the memorial has been superintended by Mr. W. Swinfen Barber, of Halifax.

The parish-church of Langford, near Witham, Essex, was reopened on Wednesday week, after restoration carried out at a cost of £3,000. Mr. Browning, of Stamford, was the architect, and Mr. Thompson, of Peterborough, the contractor.

A new bridge, 30 ft. wide between parapets, is being thrown across the railway at Ovenden, near Halifax, in connection with the opening up of new roads in that district. Messrs. James Brier, Sons, and Wilson, of Dewsbury, are the contractors, and the work is being carried out under the superintendence of Mr. Kell, district engineer, of Leeds.

Two memorial windows have just been erected in the Lady-chapel of Chichester cathedral. That to the memory of Canon Ashwell represents Our Lord in the midst of the Doctors in the Temple; the other, to the Countess of March, shows Simeon bearing in his arms the Infant Christ. Messrs. Clayton and Bell, of Regent-street, London, carried out the work.

Building Intelligence.

BIRKENHEAD.—The Unitarian church at Charing-cross, Birkenhead, was reopened on Sunday last, the 4th inst., after various alterations and additions had been made. A new chancel, 17 ft. 6 in. x 12 ft., has been added, with organ-chamber and vestry attached. A window to chancel has been executed, filled in with stained glass, subject being "A Vision of St. Louis on the Shores of Palestine." New glass has been put in all the old windows, and the whole church has been refurnished and decorated. The lecture-hall below has been nearly doubled in size, with cloak-room and conveniences attached, and new approaches thereto. The whole, which has cost about £1,850, has been carried out under the direction and supervision of Mr. James N. Crofts, architect, 5, Harrington-street, Liverpool.

CARRICK-ON-SUIR.—A new church has been dedicated in honour of St. Nicholas in the town of Carrick-on-Suir, which stands on the borders of the two counties of Waterford and Tipperary. About seven years ago, Mr. J. J. MacCarthy rebuilt the front on a design which closely follows that of San Miniato at Florence. But subsequently the parish priest determined to rebuild the whole, and entrusted the preparation of plans to Mr. C. Ashlin, whose design harmonises with the front. The style is Romanesque, and consists of nave, aisles, apse, chancel, and side-chapels. Two tribunes have been added for the accommodation of the Presentation Nuns and the Sisters of Mercy, whose convents are contiguous to the church. The internal dimensions are:—Length, 151 ft.; width, 61 ft.; height of nave to ceiling, 52 ft.; height of aisles to ceiling, 31 ft. The nave arcade carrying the clerestory walls is supported on columns 20 feet in height, having shafts of polished red granite, with Kilkenny marble bases and elaborately carved Portland stone capitals. The chief light of the church is derived from the clerestory, the walls of which are pierced by twenty-four semicircular-headed windows, which are filled with stained glass. There is a lofty arch at the termination of the nave, supported on piers having shafts and pilasters of red and blue granite. The capitals of these piers have sculptured representations of the emblems of the Four Evangelists, and of adoring angels alternately. The aisles are terminated by similar arches resting on pilasters having blue granite shafts. The ceilings of the chancel and side-chapels are groined and enriched with carved bosses. The ceilings of the nave and aisles are flat, and divided into panels by deeply-moulded and enriched beams. The Communion railing is of white marble, having shafts of Siena marble and panels of Mexican onyx. The gates are of wrought iron and brass, and are enriched with coloured marbles. The floor of the sanctuary is laid with encaustic tiles. The high altar is of white marble.

CULLEYBACKEY.—A new Presbyterian Church at Culleybackey, near Ballymena, was opened on the 1st inst. The church is Early Decorated in style, and consists of nave and transepts. On one side of the principal front is a tower of four stages, having upon it a spire, the whole rising to a total height of 130 ft. from ground. The walling is of local basalt, with dressings of Dungannon sandstone. Above the platform and in each transept is a large circular traceried window. The roofs are half-ceiled. The internal joinery is of pitch-pine and walnut varnished, and seats are provided for 700 worshippers. Messrs. Young and Mackenzie, of Belfast, were the architects, and Messrs. H. M'Manus and Sons, of Randalstown, the contractors; Messrs. Ballantine and Co., of Edinburgh, supplied the stained-glass with which the principal end window and a side-light are filled. The cost of the church has been about £5,000.

DARTMOUTH.—The Royal Dart Yacht Club House, at Kingswear, Dartmouth, was formally opened on Friday week with a ball given by the flag officers of the club and Mr. Llewellyn. The new building contains on the ground-floor a smoking-room, writing-room, bar, cloak-room, &c. for gentlemen, and the kitchen offices. On the upper floor a reading-room, ladies' room, with cloak-room, &c. The building is of red brick, and finished throughout on the inside

with pitch-pine and white deal, varnished. Attached to the premises is a large lawn-tennis court. The work has been carried out by Mr. J. Fraden, builder, of Ashburton, from the designs and under the superintendence of Mr. Edward Appleton, architect, of Torquay.

HASTINGS.—The new Town Hall at Hastings was opened on Wednesday. The building, which in style is a free treatment of Early English Gothic, has its principal façade in the Queen's-road, near the centre of the modern part of the town. The public entrance to the court-room, in which the sessions, the county court, and police-court cases will be taken, is from a street on the opposite or western side of the building. In the arrangement of the interior of the court, provisions, not usually found in such buildings, have been made for the comfort of jurymen, and a system of ventilation has been adopted which it is hoped will give sufficient fresh air without causing dangerous draughts. On the north side, which overlooks a public recreation ground, locally known as the Cricket-field, the chief features of the exterior are the large recessed window of the Council Chamber and eight large stone panels in the pediments of the windows, carved in high relief, the work of Mr. Earp. These represent the arms of the Cinque Ports, the building of Hastings Castle, the battle of Hastings, the Cinque Ports barons bearing, by ancient privilege, the canopy at the coronation of some king, the defeat of a force of French invaders in 1360, Queen Elizabeth granting a charter to the corporation in 1558, the sailing of ships fitted out by the Cinque Ports to meet the Spanish Armada in the same year, and Hastings fishermen boarding French pirates. The building is of a local blue stone, said to be harder and more durable than Kentish rag; the dressings are of Bath stone. The cost of the building, including fitting and furnishing, will amount to about £20,000. Mr. Henry Ward is the architect, and Messrs. D. C. Jones and Co., of Gloucester, were the builders.

STAINES.—A new river-wall is being constructed at the back of the new Town-hall, Staines, in order to obtain a regular frontage line to the river, together with a suitable landing-stage and steps, leading to the New roadway at the side of the Town-hall. It is being built partly with bricks and partly with cement concrete rusticated blocks, and will form a retaining-wall to the vacant land at the side of the river. It will be raised in order to prevent the land from being swamped by the winter floods. The spare land will in all probability be sold for building purposes, in plots suitable for a class of house much needed in the town. The whole of the works are being carried out by Mr. Ralph Fitt, C.E., the surveyor to the Staines Local Board.

WEYBRIDGE, SURREY.—A new Roman Catholic church, erected near the railway station, was opened on Wednesday week. It is Early Decorated in style, and consists of nave, chancel, and Lady-chapel. The walls are of Bargate stone, with dressings, stringcourse, and quoins of Bath stone. The windows are in triplets, each light containing a stained-glass figure of a saint. The seats are open, of stained yellow pine, and provide accommodation for 200 persons. The altar is of Bath stone, the reredos of stone, gilded, and the baldacchino is supported by carved figures of angels playing musical instruments. The chancel-floor is paved with Minton's encaustic tiles. The pulpit is of Caen stone relieved with gilding. A new presbytery is in course of erection on the north side of church. The architect is Mr. Alfred S. Purdie, of Notting Hill, W., and the builder, Mr. S. Woods, of Weybridge. The cost has been about £3,000.

The Golden Valley Railway, in South-west Herefordshire, was opened for traffic on Thursday, the 1st inst. It extends from a junction with the Great Western system at Pontrilas to Abbeydore, Vowchurch, Peterchurch, and Dorstone, at present the terminus. With stations in each of those villages, the length is eleven miles, but it is intended eventually to extend the line north-west to Hay and south-east to Monmouth. Mr. G. F. Ellis was the engineer, and Mr. J. P. Edwards, the contractor.

The corner-stone of a new Reform Club was laid at Heywood, S.E. Lancashire, on Saturday last. The building will be erected on the site of the old market at a cost of about £5,000; Messrs. Maxwell and Tuke, of Bury, Lancashire, are the architects.

COMPETITIONS.

DARLINGTON BOARD-SCHOOL COMPETITION.—At a recent meeting of the Darlington School-board, called for the purpose of considering competitive drawings for the proposed additions and alterations to the Bank Top Schools, the design of Mr. G. G. Hoskins, F.R.I.B.A., of Darlington, was unanimously selected. The competition was confined to architects resident in Darlington.

FULHAM WORKHOUSE INFIRMARY.—For the proposed new infirmary at the Fulham-road workhouse, about 30 sets of designs were sent in on Thursday, the 1st inst. Their examination has been deferred by the guardians till Tuesday next.

THE GLASGOW MUNICIPAL BUILDINGS.—At the last meeting of the Glasgow Town Council, in answer to Mr. Filshill, who inquired if it would not be well for the city architect to begin and prepare a foundation for the new Municipal Buildings in George-square: the Lord Provost said he had made inquiries on this subject of architects who had been engaged in large operations, and he had been told that it would not facilitate operations for the city architect to begin and prepare the foundation just now. His Lordship added that there had been 135 sets of plans sent in for the competition, as compared with 96 on the previous occasion.

CHIPS.

A competition is to be held shortly of designs for the reconstruction and enlargement of the Sorbonne. The expense is estimated at more than 22,000,000fr.

The foundation-stone of the new parish-church of Duncausburgh, Fort William, was laid last week. The plans are by Messrs. Ross and Mackintosh, architects, Inverness and Oban, and the contract was taken by Messrs. Henderson and McInnes, Ballachulish. The building of the church involves an outlay of about £3,700.

A memorial-stone was laid at Mount Zion Primitive Methodist chapel, Norland, near Halifax, to celebrate the enlargement and addition of new classrooms. Mr. J. Pirih, of Elland, is the architect, and the work is being carried out by local contractors.

On Tuesday a new Baptist chapel was opened in Commercial-street, Hereford. It seats 700 persons, and has been erected by Mr. William Bowers, contractor, Hereford.

The parish-church of Goodleigh, Devon, is in course of rebuilding. Mr. Thomas Garland, of Barnstaple, is the contractor.

A Sanitary Protection Association, for Portsmouth, which is intended to undertake the supervision of the drainage arrangements of private houses, so as to insure their proper sanitary condition, was started at a meeting held on Monday night under the chairmanship of the ex-mayor, Mr. Alderman Cudlipp. The association proposes, as a supplementary object, to enable its members to procure practical advice on moderate terms, so as to obtain the best means of remedying defects in houses of the poorer classes.

A correspondent of the *Standard* enters a protest against the desecration of the Priory Chapel of St. Leonard, at Stamford, where, he says, it is actually proposed to turn the north aisle into a cart-hovel, and to shut out this fine Medieval building from the public view. The Priory is one of great interest to architects and antiquaries, to say nothing of the sacrilege of putting to most ignoble uses a consecrated building of the Christian Church.—It has twice been illustrated in the *Building News*—on Jan. 3, 1875, and on Jan. 26, 1877.

Forty of the passengers of the ill-fated *Tarent* comprised masons, joiners, and painters, with their wives and children, and other relatives. Eight are known in Glasgow, five being young men who were proceeding as painters to Port Elizabeth under an engagement from a Glasgow firm.

We are informed that Mr. Thomas Armstrong will succeed Mr. Poynter, R.A., as art-director at South Kensington, and Mr. Sparkes (now head master) as principal of the National Art Training School. Mr. Poynter has, however, consented to continue his connection with the department as visitor of the Training School.

An inquiry is to be held to-day (Friday) at Alfreton, before Mr. R. Morgan, inspector, into an application to the Local Government Board from the Alfreton urban sanitary authority for sanction to borrow a further sum of £1,000 for works of water supply.

"To a practical man with a taste for mechanics, and the bumps of constructiveness fairly well developed, we can conceive no higher mental treat than a couple of hours spent over the June numbers of that truly marvellous publication the *Engineering*. In a hundred and fifty odd pages that make up the bulky mass of letterpress, there is recondite information on almost every conceivable subject, ranging from how to construct a mouse-trap, to the latest method of calculating the phases of Orion.—The *Engineering*. Price Two pence of all newsmen, or post free 2d.—31, Tavistock-street, Covent-garden, W.C."

TO CORRESPONDENTS.

[We do not hold ourselves responsible for the opinions of our correspondents. The Editor respectfully requests that all communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondence.]

All letters should be addressed to the EDITOR, 31 TAVISTOCK-STREET, COVENT-GARDEN, W.C.

Cheques and Post-office Orders to be made payable to J. THOMAS EDWARDS.

ADVERTISEMENT CHARGES.

The charge for advertisements is 6d. per line of eight words (the first line counting as two). No advertisement inserted for less than half-a-crown. Special terms for series of more than six insertions can be ascertained on application to the Publisher.

Front Page Advertisements 2s. per line, and Paragraph Advertisements 1s. per line. No front page or paragraph advertisement inserted for less than 3s.

SITUATIONS.

The charge for advertisements for "Situations Wanted" is ONE SHILLING for TWENTY WORDS, and Sixpence for every eight words after. All Situation advertisements must be prepaid.

Advertisements for the current week must reach the office not later than 5 p.m. on Thursday. Front page advertisements and alterations in serial advertisements must reach the office by Tuesday to secure insertion.

TERMS OF SUBSCRIPTIONS.

(Payable in Advance.)

Including two half-yearly double numbers, One Pound per annum (post free) to any part of the United Kingdom; for the United States, £1 6s. 6d. (or 6dols. 40c. gold). To France or Belgium, £1 6s. 6d. (or 3fr. 30c.). To India (via Brindisi), £1 10s. 10d. To any of the Australian Colonies or New Zealand, to the Cape, the West Indies, Canada, Nova Scotia, or Natal, £1 6s. 6d.

Cases for binding the half-yearly volumes, 2s. each.

NOTICE.

Now Ready.

Vol. XL. Price 12s. A few bound volumes of Vol. XXXIX. may still be had, price Twelve Shillings; all the other volumes are out of print. Most of the back numbers of former volumes are, however, to be had. Subscribers requiring any back numbers to complete vol. just ended should order at once, as many of them soon run out of print.

RECEIVED.—D. Bros. and Co.—H. L. B.—J. F. E.—J. M.—D. F. Co.—G. S. and Co.—H. and Co.—E. C.

Correspondence.

ARCHITECTURAL EXHIBITIONS.

To the Editor of the BUILDING NEWS.

SIR,—Looking over a back volume of the *Building News* the other day, I came across some proposals that an exhibition as above should be held (but, I believe, only in consequence of the coming Architectural Conference, and for the members especially to inspect). Now what my object in writing is, is to suggest that such an exhibition should be held annually in London, and open to all members of the profession without limitation as to age; that also in addition there should be prizes awarded to the best designs sent by students under, say, 25 years of age, but to none older. The question would, I dare say, be asked: "But where would the funds come from?" Surely there are a great many members of the profession ready to subscribe towards it; and this, with a small fee for entrance, would certainly cover all expenses the exhibition would entail. This would, I am quite sure, confer upon all architectural students in this country a long-wished-for boon, not only enabling those in London, from seeing other styles of design, &c., but by giving all students something definite to employ their leisure time with.

I am very sure that once an idea of this kind took root, and aided by some influential members of the profession, it would in a very short space of time be an acknowledged benefit to the profession at large.

Hoping sincerely that some of your numerous readers and contributors will take this idea up and fully develop it, and apologising for trespassing on your valuable space,—I am, &c.,

C. L. MALLORY.

Bedford, Sept. 6.

THE DESTRUCTION OF THE LANTERN TOWER OF WIMBORNE MINSTER, DORSET.

SIR,—In reply to Mr. Mills Robbins' letter, I beg to state that when in Wimborne last year, I was informed that it had been the express wish of the late Mr. Wyatt that he should be succeeded in any restoration work at the Minster by Mr. Christian; and, subsequently, that a report had been received from Mr. Ewan Christian, and "adopted."

Can, therefore, Mr. Mills Robbins substantiate his statement that Mr. Christian has "nothing to do with the restoration of the tower," by giving the name of "the architect" vaguely alluded to as having unsuccessfully demanded an apology for the obnoxious word "vandalism"?

Surely the preservation of so valuable and unique a specimen of Medieval architecture is of sufficient importance to make it essential that the names of those responsible should be made public.—I am, &c.,

FRANCIS E. JONES.

20, Cockspur-street, London, S.W., September 5th.

SIR,—As it may injure the subscription list for the above if the charges of your correspondent, Mr. Mills Robbins, are allowed to go unchallenged, and as he seems unwilling to publish my letters, I feel it my duty to ask you to insert a few words to correct the statement he has made. The lantern-tower of this church is built of four different sorts of stone—Portland, Purbeck, Tisbury, and Heath-stone, in random courses, and without any regard to colour. In the repair now being executed, the greatest care has been taken to replace the decayed masonry with stone of similar character and colour. Your correspondent has behaved throughout in the most uncourteous manner. The fact of his inspecting the works without first giving me notice of his intention of doing so, is quite enough to show what he is and why he was so anxious to appear in print.—I am, &c.,

WALTER J. FLETCHER.

Wimborne, Sept. 3rd.

DESIGNS FOR STAINED GLASS.

SIR,—Some little time ago eight of the principal stained-glass firms were asked by Mr. Walter Hanstock, F.R.I.B.A., a well known Yorkshire architect, for designs for a proposed memorial window. Ultimately, the design of Mayer, of Munich, was chosen by the client, not on the score of cheapness, certainly, for his estimate was the highest one of the lot. In due course the other seven were written to and thanked, and the gentleman's choice notified to each one of them. Upon this, one firm of glass-stainers sent Mr. Hanstock a bill for £3 for design supplied for approval. This he resisted, as unreasonable, and contrary to the custom of the trade. The ultimate result was that Mr. Hanstock was served with a County-court summons last week by the artists in question to appear at Dewsbury at the next Court held there.

Are architects personally liable whenever they solicit designs or prices on behalf of their clients from makers of specialties? If so, it may be prudent on their part to abstain from placing themselves under such serious obligations in the future. For a gentleman, under such circumstances, to be dragged, as a defaulter, into the nearest County-court, seems, even at the best, an extraordinary proceeding.—I am, &c.,

QUERY.

COMPETITION: VICTOR EMMANUEL MEMORIAL.

SIR,—I fear there is something "uncanny" about this, judging from a rather prominent announcement in the *Daily News* of 6th. The time for receipt of designs is not till the 23rd inst., and yet from the information the *Daily News* is authorised to give, it would appear the matter is already settled. Particulars of what the design is to be given, also the terms arranged with the "Artist," &c.; also the locality of the memorial—Piazza del Indipendenza, in Florence—although the instructions of the competition distinctly stipulate it is to be in Rome. It is just possible the editor or informant are under some mistake, but a brief time will show this.

Meanwhile, I, as a competitor, have telegraphed to stop the delivery of my drawings *in transitu*, having only sent them off four days since.—I am, &c.,
September 7th. COMPETITOR.

EXPANSION OF CEMENT AND CONCRETE.

SIR,—Cracks in the New Victoria Dock walls are, no doubt, due to contraction, and Messrs. Dyckerhoff's experiments indicate the expansive character of the cement they used. It will be dangerous for the engineer or architect to ignore the teachings thus placed before them. All experienced cement and concrete-makers are well acquainted with both of these developments, and carefully guard against their dangers. Until recent years, all the vagaries surrounding the use of imperfect cement was looked upon as "swelling," "flying," or "cracking." The cause of these faulty results was not examined with any degree of accuracy in past times; but it is now well-known that defective crystallisation is the source from which all these evils spring. There is no "see-saw" process, as suggested, further than that due to fluctuating temperature, and to which all building materials are in different degrees liable.

Setting of cement is a chemical process, and is best performed where the required reactions are in accordance with natural laws; any departure or divergence above or below the datum of safety (as true Portland cement), produces expansion or contraction. The cement user is helpless unless he can command a reliable supply of good Portland cement, the acceptance or rejection of which should depend upon his own carefulness.

I am afraid that Mr. Faija's panacea for the control of cracks will not afford much comfort to the afflicted. It is impossible, by means of laths or "thin wooden battens" to concentrate the eccentric cracking of a faulty cement, and, even if Mr. Faija were to supplement his wood fixings by the strongest of iron cramps, the contractive or expansive action would travel in all directions, regardless of any ingenious mechanical dictation.

A somewhat amusing example of this kind of attempted controlment took place at Liverpool about ten years ago. At St. George's Pier-head, when the new approaches were made, the engineer determined that the monolithic concrete foot pavement should be first-class in character. To insure the desired results, the best London cement was used, and the divisions made, as now suggested by Mr. Faija, in the most careful manner. In a very short time, however, the cracks of contraction became developed, and proceeded in myriads of diagonal lines all over the pavement.

I would still, as I have invariably done, advise cement users to test the cement for themselves, and endeavour, by investigation, to acquire a common-sense knowledge of so important a material. Authorities do differ, and too much heed is given to theorists, who often mislead the practical man.

No one at all acquainted with the latest experience of cement or concrete would think of laying floors or plastering in a series of coats. There are many good reasons against such practice, and I would not recommend builders to trust too much to doors, windows, &c., for relief against either expansion or contraction of Portland cement concrete. Cement capable of disturbing the aggregate with which it is associated, will eventually disintegrate, and it is only a question of time when its influence will become developed into danger and loss.—I am, &c.,
HENRY REID.

London, September 2nd.

SIR,—A few summers ago my attention was drawn to the expansion of cement in a most decided manner by a gentleman calling at my office. He stated that the flags in a certain street had risen up, and were dangerous to the public. I immediately went to the place, and saw such to be the case. The footway of the street had been down several years, and laid partly with continuous cement-concrete, and partly with flags. A sudden rise in the temperature had expanded the cement, thereby causing the flags to rise at the first joint after leaving the cement.

A man was sent to cut a piece off the cement,

and the flags were again laid in their places, where they still remain.

In this town there is a footbridge across the railway near the station. It is reached by stone steps; these, being considerably worn by constant traffic, were repaired in the following manner: The portion worn was cut out about 2in. below the original height of the steps to about 6in. or 8in. from the end, the portion cut out being carefully filled up with cement-concrete. In several cases the expansion of the cement has been so great as to break several of the steps across, the small piece being held still in place by the iron handrail.

In preparing a specification for laying cement footpaths, I had a special clause inserted to have the footway laid in alternate blocks, in order to obviate the effect of expansion as much as possible.

I laid a very considerable length of footpath last year, the average width being 6ft. within the kerb. The concrete-slabs are from 5ft. to 6ft. in length, except where the services are laid for gas, these being about 18in. wide. The edges of the squares were preserved by two laths, each 1½in. thick, and 3in. wide. These were allowed to remain overnight for the cement to set. The laths were then removed, and the intermediate squares filled in.

By this means I did not expect to find any trace of expansion; but at every corner where the cement was laid round a curve, the cement is now forced from the wall (in some cases nearly ¾in.) for a considerable length. This can only arise from the expansion of the Portland cement, which was used in the proportion of two parts of crushed granite to one part of cement.

I have also observed that if a shower of rain fall on cement that has been laid for several hours, the surface becomes covered with very fine cracks, only observable when filled with rain.

This is the case in almost every instance. Yet cement briquettes intended for testing are invariably immersed in water for seven days previous to being tested.—I am, &c.,

JNO. PETRIE.

Borough Surveyor's Office, Jarrow-on-Tyne, Sept. 3.

MR. DAVIES AND HIS U-TRAP.

SIR,—On reading Mr. Davies' letter, on page 313, in reply to mine on page 281, I had a model U-trap made of precisely the same shape and size as the one used by him at the discussion, and, from the trials I have already put it to, I can see no reason to alter the opinion I have expressed with reference to the experiments Mr. Davies made with his model. I intend, however, to test it more fully, and with it, for the sake of comparison, Beard and Dent's 2in. U and S-siphon, and will, as soon as possible, forward to you the results.—I am, &c.,
DANIEL EMPTAGE, S.E.

Dane-hill Sanitary Works, Margate, Sept. 7.

SIR,—I certainly fail to see how Mr. Davies' experiments with his model of the U-trap can be accepted as conclusive. It is without doubt a great improvement, and I for one should be glad to see it the only kind of U-trap in actual use, as we must have them. Now, a few years ago I experimented with the U-trap, and with no less than three improved models, and found that for easy clearance with the smallest amount of water, the S-trap, when properly constructed, had the advantage, and held less water than the other four models, besides containing less space to foul the water forming the seal, and when fixed under certain circumstances, was not near so liable to siphon, or wave out as Mr. Hellyer's U-trap. I since have adopted (when possible, for sometimes the plumber has no choice, having to work to the ideas of others) and advocated the use of the S-trap.

With regard to Mr. Davies' graphical method of striking out the side of the U-trap, there is but a trifling difference between his method and the proper method in general practice—namely, 12in. across the top of the cheek, and the slight extra space is quite compensated for by the easier sweep of the band thus gained by the older method, which anyone can understand by drawing his method and marking off an extra inch across the top, and drawing a line from the mark until it intersects the circle. This way is

well known to trap-makers, and I believe Mr. Pullen has used this method for some time.

I shall accept Mr. Davies' kind invitation early, as I again intend to test the U-trap.—I am, &c.,
H. B., M. S. P.

Lambeth, Sept. 3rd.

WASTE-PIPE VENTILATION.

SIR,—In reply to Mr. Emptage (page 313) respecting the open ends of waste-pipes, I beg to say why I prefer them closed, for last year's frost taught many a serious lesson by way of being frozen in.

Open ends are very well in a sanitary point of view; but let them be fixed accordingly, for I will not admit it being sanitary to fix the end of a waste-pipe so that you cannot use the sink for weeks together.

No one can deny that the open-ended pipe, when put into its proper place (that is to say, two or three feet away from the mouth of the gully-trap, and the channel kept properly cleaned), is far better than being placed direct over the top of a gully, so far as gases are concerned.

But how many even so-called sanitary engineers will do this? Not one in fifty. Further, how many ever think about fixing a flap over the end of the waste-pipe to keep back the frosty air? And more than this, how many are there that take the trouble to see such flaps properly protected against frost? My experience with these gentlemen tells me that I never saw or heard of one—no one.

I now ask Mr. Emptage to examine the much-talked about disconnected system as practiced about London (not that I am in favour of waste-pipe being connected with the drain). Examine the gully-trap inside and out after it has been in use, say, two or three years, especially when used for four or five-roomed houses. My experience has been, that the sides of the trap, also about and above the grid, become coated with filthy matter. Here gases generate, and when the open end of the waste-pipes are fixed even within 6in. or 12in. of these stinking holes, what may we expect, considering that this waste-pipe is not trapped? It is all very well to say, as Mr. Hellyer has said, that the trap should be used inside the house; but our sanitary inspectors do not enforce them, and even if such traps were to be enforced, they are very liable to become choked up, to say nothing of being frozen in the winter. I maintain that under such circumstances this cannot be called sanitary plumbing, unless the open end is properly protected against frost and a full-sized grating used.

Now if you take the end of your waste-pipe to, say, within 2in. of the bottom of the gully-trap, or, say, 2in. below the throat of the trap, I ask, How can this pipe "become a means by which sewer-gas can escape without interruption into the house"? And how is it that the further the end of the pipe enters the trap that the more objectionable it is? I am thoroughly aware that the water in the trap is not pure (but, to a certain extent, I have a cure for this—namely, the trapping of the end of the pipe before it enters the water contained in the gully-trap, which may be done by causing the end to dip into a very small bowl one size larger than the waste-pipe, or by turning the end of the pipe above the water line in gully-trap, so as to form a trap within and below the gully-trap grid, which will be thoroughly out of the reach of frosty air) and am also aware that 36 square inches of sewage water (to say nothing about the surrounding sides of the trap, grid, &c.) will send off 36 times as much gas as can come off a lin. surface contained within a pipe when dipping into a trap. Therefore, I say that if the open end of this waste-pipe is over or within a few inches of the gully-trap, it has every chance to convey the generated stink into the house. I know that this pipe, when open at the end, is large enough to carry a 100 times as much gas as can ever be generated from this gully; then is it not best to stop the end in some way or other? Of course if you cannot depend upon the gully-trap being always trapped, do not attempt to put the pipe into the trap; but even here, if the pipe is taken to the bottom of the trap, it will be far better than terminating it above the water-line or just over the grid. I should like to have Mr. Buchan's answer to this.—I am, &c.,

P. J. DAVIES, Hon. Mem. A.S.P., &c.

SIPHONAGE OF TRAPS.

Sir.—Mr. Michael Drury, in his first letter, on page 87, says:—"It is only reasonable to expect that the same orifice which, as is well known, so effectually destroys the action of a simple water siphon-pipe would be equally effective in restricting the siphonic action of a sewer siphon or C-trap."

Mr. Drury starts with this text, and, notwithstanding his own perfectly true, and several times repeated, assertion that, "The force which sends the water rushing through a w.c. siphon, is not a siphonic or gently-drawing force, but an impulsive driving-action, caused by the weight and fall of the water," he still continues to treat it as though it were like what he also truly describes as, "the gently-drawing force of simple water-siphon."

Mr. D., also on page 314, says: "A vacuum is impossible if the siphon is punctured." Here he is quite right with regard to the one kind, but equally wrong with respect to the other. With a soil-pipe, the extent of the vacuum will depend upon the bulk and force of the flush, which drives the air before it down the pipe, more especially where there is a foot vent, and, consequently, no resistance. The air being thus driven out, creates a vacuum behind it, which has to be instantly supplied, either by the air-pipe or through the trap; hence the necessity for an efficient orifice.

It will help to make matters more clear to Mr. Drury, and also to some of his readers, if they will try the following experiment, which I have myself tried.

Bend a piece of lin. lead pipe to the form of a siphon, making the long leg about 2ft., and the short one about 8in. long. Place the short one through the side of a tank, then fill the tank by means of a pail to about 1½ in. above the bend, and the siphon will start and empty the tank. Now, make a ½ in. hole in apex of siphon, and again fill up your tank; you will now find that the water will only run out to just below the bottom of bend, simply because air is admitted through the small hole which has destroyed the siphonic action. Now, add to the long leg another 6ft. of pipe, and again fill your tank; you will now find the siphon will start and empty it as freely as at first; the drag and weight of water in the long leg is now strong enough to overcome the influence of the air at apex. Now, increase the air-hole to 3-16 in., and the siphon will again fail, and so you may go on.

This experiment shows the difference in the action of the two kinds of siphons. If you depended for starting this siphon upon a "gently drawing force," you might draw away until Doomsday, and would get nothing but air through the apex.

Mr. D. also says: "As the trap is always fixed closely adjacent to the basin, it is difficult to conceive the possibility of a flush of such an impelling nature that it should run itself out at the trap hollow."

Now, really, this shows the extent of Mr. Drury's knowledge of this matter. If he had watched the action of w.c. traps, and more especially those in connection with direct-action basins, he would have found that his "difficulty" would have been how to retain the seal in the trap. The fact is, the seal will very readily go out, both by waving and siphonage, unless properly protected by ventilation. I would advise Mr. Drury at once to try some half-dozen direct-action w.c.'s by throwing in a pail of water in a rather careless manner, as is often done by our servants, and I am sure he will require no further proof upon this point.

I am very glad to see that Mr. D. has very greatly qualified his assertion that no harm would be done by the unsealing of a w.c. trap when provided with his ½ in. pipe at apex, and that he now says that a trap, if only unsealed momentarily, would be fraught with direful danger.

Hoping this letter will satisfy Mr. Drury, and thus save the need of further correspondence.—I am, &c., DANIEL EMPAGE, S.E.

Dane Hall Sanitary Works, Murgate,
September 6th.

The Town Council of Wisbech upon the 1st inst. last week for the reconstruction of the south main sewer. The lowest offer received was £910, whereas the surveyor, Mr. Bailey had estimated the cost at £863. On a division, it was resolved that the work be carried out by the surveyor.

Entercommunication.

QUESTIONS.

[6643].—**Skew-Bridge Construction.**—Will any one favour me with the name of a work on the above subject, one that a workman can comprehend?—D. M.H.

[6647].—**Removing Whitewash.**—Will one of the experienced correspondents of the BUILDING NEWS kindly describe any efficient process by which I can remove whitewash from the rough outside walls of a 16th century dwelling-house?—LANGLORD.

[6648].—**Restaurants.**—I shall be glad of a list of London restaurants and coffee taverns worth visiting, with any special points of design or planning which should be noted by a—PROVINCIAL ARCHITECT.

[6649].—**Roof.**—What outside thrust would a principal of the accompanying description, loaded uniformly with

3½ tons, exercise on the walls! What improvement, if any, is necessary? How much will a semi-circular, laminated arch, 40ft. in diameter, 4in. deep by 1in. thick, constructed with eight ½ in. boards of red deal, and ½ in. iron pins 1ft. apart, expand when loaded about the crown with 3½ tons? Early answers will greatly oblige.—DEXNIS, Glasgow.

[6651].—**Ventilation of Soil Pipe.**—A short time ago I attached a 2in. ventilating pipe to the bend of my soil-pipe, and carried same well above the roof. I did not put a cow on top, thinking it better to leave the end open to the sky. Whether down draughts prevent the effectual working of the ventilating pipe I cannot say, but the w.c. seems continually charged with sewer gas. I may mention that the apparatus is the usual pan-closet apparatus, with container attached. What should I do to protect my family from illness? Would one of Ewart and Co.'s 2in. "Empress" ventilating cowls fixed to top of ventilating pipe cure the nuisance, as these ventilators appear to be very excellent!—T. P. F.

[6651].—**Wood Block Flooring.**—I should be glad of the experience of any of your readers as to the advantages or otherwise of this kind of flooring for schools and buildings of a similar description. Also the most approved method of laying the same. I have used them in exposed situations such as summer-houses, and in other out door work, and with satisfaction. In these cases the blocks were 12in. by 4in. by 2½ in., laid on concrete, and bedded in sawdust. Three pieces were nailed together and laid at a time, but without dowselling. I am thinking now to use them in two or three schools on account of their noiselessness, and would be glad to know, in cases where they have been adopted, if they are approved.—PROVINCIAL.

REPLIES.

[6644].—**Measuring.**—In my answer on p. 283, 4th line from bottom of the first column, read "shortening or its appearance," instead of "shortening of its appearance." "Appearance of shortening" would be better still.—HUGH MACLACHLAN.

[6624].—**Traps.**—OMISSION.—Line 12 from bottom of this answer on p. 283, read after "sharper edges" "and divisions." The P-trap should have a deeper bend than shown.—HUGH MACLACHLAN.

[6625].—**Drying-House.**—Build a good and sound hot-air stove into a brick chamber with fresh air conduits from the exterior into same, and an opening for the escape of heated air into the room at top. This stove, if furnished with gills, will be more effective. If the drying room is small, the brick chamber may be dispensed with.—HUGH MACLACHLAN.

[6627].—**Photos.—Pencil-Sketches.**—The former are best mounted by steeping them in a large flat dish of clean cold water for a few hours, when they become so loose as often to float off by themselves. Hot water injures the tone, and undue haste causes damage and holes. Pencil-sketches may be fixed either by covering them with milk, plentifully diluted with water, or by blowing a preparation over them in a light spray. This preparation may be obtained from Robertson's, artist & draughtsman, Long-acre, London. I have been informed that this preparation is a thin solution of shellac with turpentine, but I do not know the proportion.—HUGH MACLACHLAN.

[6628].—**Styles of Architecture.**—The best work on this subject is Ferguson's "History of Architecture," in three volumes. Otherwise, read in Gwilt's "Encyclopedia of Architecture," the later editions, or a small new handbook by Mr. F. Roger Smith, and published by Messrs. MacMillan and Co. in their Art Series.—HUGH MACLACHLAN.

[6628].—**Styles of Architecture.**—I am sorry not to be able to agree with Mr. F. J. Freeman in the works he recommends. Mr. Drury's work is too small and insufficiently illustrated, though it is the best recommended

by him, considering its size. Nicholson's is far too antiquated. Rickman's is a decidedly good work on Gothic architecture, but little is to be learnt from it on other styles, the part on Classic work being merely introductory.—HUGH MACLACHLAN.

[6629].—**Farmsteads.**—The following have been illustrated in the BUILDING NEWS with plans, dates given as below:—Coombe Farmhouse, Wadhurst-park, Surrey, Jan. 31, 1873. Farm-buildings at Chase Woods, Hales, Oxon., Jan. 16, 1874. Do. do., Peterhall, Beds., June 19, 1874. Do. do., Earlswood Idiot Asylum, near Redhill, Surrey, Feb. 5, 1875. The Home Buildings, Grange-park, Alresford, Hants, July 9, 1880. British Dairy Farmers' Association Prize Design for Homestead for 50 cows, Dec. 17, 1880. Homestead, Akenham, near Ipswich, May 20, 1881.—HUGH MACLACHLAN.

[6632].—**Contracts Signing.**—Yes, after the employer has had a document legally drawn up, signed, and witnessed, authorising the architect or any other person to act on his behalf.—HUGH MACLACHLAN.

[6634].—**Priced Quantities.**—The drawings, specifications, and quantities should be attached together, when only one stamp is necessary for the lot. It is usual for the contractor to sign every drawing, and the first pages of the specification and quantities, and to initial each of the other pages.—HUGH MACLACHLAN.

[6640].—**Wood-Carving.**—"Z. D." thinks he will learn wood-carving. Don't let him buy a fret saw, and after cutting out geometrically-designed panels and brackets, fancy that he has been carving wood, because it is nothing of the sort. He must try to get a few practical lessons before he starts. If he does not he will never be able to sharpen a tool properly, much less carve decently. Addis' tools are the best. He will require three dozen or so of these; chisels and gouges, more of the latter than former, a mallet, a holdfast, a carver's screw, and a small bench. All this means an expenditure of about three pounds. After that a life-time of application is necessary if the student makes up his mind to master the art. Further, all the application in the world is of no avail, if a natural taste does not exist also. Many carvers who work the hardest are really the poorest "tools."—HARRY HEMS.

[6641].—**R.I.B.A. Preliminary Exam.**—Send for the particulars and course of study to the secretary of the R.I.B.A., Conduit-street, Regent-street. This question will be found answered in a recent number.—G. H. G.

[6641].—**R.I.B.A. Preliminary Exam.**—I believe what will be the last Volunteer Architectural Examination was held at the rooms of the Institute in June last. It is now to be replaced by the Compulsory Examination for intending Associates. Write to Mr. W. H. White, secretary, 9, Conduit-street, Regent-street, London, W.—HUGH MACLACHLAN.

STAINED GLASS.

HALIFAX ST. JOHN'S (WESLEYAN).—A two-light stained-glass window, dedicated "to the memory of Anne, wife of Henry Edmunds, junior, ob. 2 April, 1881," has just been erected in this chapel. An allegorical female figure of "Faith," partly supported by a staff, cross-crowned (emblematic of the Gospel Word), occupies one light. Another of "Hope," with right-hand resting on the emblem-anchor that entereth within the Veil, the respondent light. Each figure stands in front of a shoulder-high, chastely white and gold diapered screen, and beneath a richly-carved canopy. A nimbus of glory, upon a rich ruby background visible above the screen, surrounds each head. Celestial crowns, with palm-branches crossing, constitute the special feature of the tracery lights above. The figures are tenderly coloured, the robes of the one in green and yellow tints, of the other, dark blue and russet brown. The ornamental tracery, canopies, borders, &c., are in 15th-century style; whilst, generally toning the whole, a subdued golden glow seems to light up the more salient details. The style and tone especially harmonise with the cathedral-like architecture of this beautiful structure. The window, from the studio of Messrs. Powell Brothers, Leeds, was erected under the superintendence of the architect, Mr. W. Swinfen Barber, of Halifax.

The Sickley mortuary chapel at Lowick Church, Northamptonshire, has just been restored and re-roofed; the work has been carried out by Mr. Ireson, of Tansor and Oundle. At the same time a new organ, built by Messrs. Wordsworth and Maskell, of Leeds, has been placed in an organ-chamber built on north side of the church. The opening services took place last week.

The mean old buildings which encumbered and endangered the east end of St. Peter Mancroft Church, Norwich, an edifice now being restored from Mr. G. E. Street's designs, have just been purchased, and will be cleared away, thus opening out the view of this large and handsome church from the Haymarket.

St. Peter's Church, Thanet, has just been relighted by means of standards and brackets, executed by the firm of Jones and Willis, of London and Birmingham. The same firm have also supplied a handsome and massive eagle lectern.

At a meeting of the congregation of All Saints' parish church, Sudbury, Suffolk, held on Friday, it was decided to restore the church, and to provide new floors, open out windows, and repair the battlements and roof.

LEGAL INTELLIGENCE.

HEAVY CLAIM FOR COMPENSATION.—At the Institution of Surveyors on the 30th ult., the case of Sir W. Hart Dyke v. the Darent Valley Main Sewerage Board came before the umpire Mr. F. Vigers, the arbitrators being Mr. W. Hodson (Farningham) for the claimant, and Mr. J. Tootell (Maldstone) for the board. This was a claim in respect to an easement of the right of the defendant board to run certain 2ft. drainage-pipes through the residential estate and appendages of the claimant's property, Lullingstone Castle, near Dartford, Kent. Mr. Pollard, instructed by Messrs. Meynell and Pemberton, was counsel for the claimant, and Mr. Douglas Kingsford, instructed by Messrs. Carnell and Son, Sevenoaks, appeared for the board. In opening the case, Mr. Pollard explained that a board having the powers of a sanitary authority, in laying down drainage, were not compelled to purchase any individual's land for the purpose of carrying out their scheme; but according to the same Act of Parliament which gave them these powers the owner could estimate the damage he suffered and claim compensation. There was no general rule that could be laid down as to the amount an owner of land could make for compensation. In this case it could not be estimated at per foot or per acre; it was not a mere matter of calculation in £ s. d., as the damages his client had and would sustain were of a peculiar nature. These cases entirely differed from cases where railway companies were connected. A railway company could be compelled to purchase the land if they required it for such purposes as a tunnel, and in running through private property they had always to pay pretty smartly for it. He should ask the umpire to pay attention to the Public Health Act, and that clause which entitles his client to come before that court and make a claim for compensation. The words in this Act were much larger in their scope than what would be found in any clause in any other Compensation Act. This Act provided that while land could be taken without purchasing, there was power to claim compensation for any damage sustained. The nature of damage might be various; if any view was interfered with, any annoyance caused by smoke, or any detriment was made to the property in any way, they were entitled to claim compensation. Sir Wm. Hart Dyke would, he (Mr. Pollard) was afraid, suffer materially if he failed in succeeding to convince the umpire that the line he took was proper. The estate possessed to some people a peculiar, exceptional, and, indeed, extraordinary value. If he could satisfy the umpire that from the peculiar elements of this estate it was of special value, and that one person would give more for that property before the action of the board than at present, then he claimed that compensation was due to his client. Lullingstone Castle could be traced back as far as the 13th century, and at the present day, having habitable accommodation, would, in the view of many now, in the 19th century, be of exceptional value. Since the 13th century there were associations antiquary about it, and it was rather peculiar to the Hart Dyke family. The damage to the character of the property, while lessening its saleable value, affected the peculiar fancy and sentimental regard which was held for it. If property was interfered with as to materially affect its sentimental value—which was really its marketable value—the amount of compensation would have to be estimated thereby. In this case the board in exercising their powers had chosen to go through the most valuable and antiquary portion of the estate. There were three or four manholes so situated as to entirely rob the property of any ideas of fancy. It seemed so inconsistent to lay this sewer where it had been laid, thus destroying those elements which made it very valuable to a certain class of buyers. The mere question for the umpire to consider was whether what had been done was likely to impair the sentimental value of the property. There were 30 manholes in a length of 9,124ft., and so close did they seem that it suggested the board had had an object to do the most damage to the property they could. The very best part of the Darent for fishing had been destroyed by these manholes; but while he was not imputing any nuisance had been caused—for his client would have his remedy if necessary—he contended that the mere presence of these manholes on that embankment was sufficient to impair its sentimental value. On this particular part of the embankment Sir William Hart Dyke and his friends could angle, and there entertain friends, but owing to the presence of these manholes, which were in such close proximity, that would not now be possible. In the meadow farm, where the sewer ran under a greenhouse, the value of that property was somewhat destroyed, for if it were required for building purposes, it could not be adapted without extra expense, and the necessary licence for building on a sewer. On the estate there was land used as a tilting-ground by Queen Elizabeth and Henry VIII. Whether it was antiquated or antiquarian, there was special value attached to it by that fact. This had been

destroyed by the presence of the sewer. It might be contended that Sir William could only claim compensation for actual damage, no regard being paid to sentimental damage. He would call attention to the 308th section of the Public Health Act on that point. Where there was a property in private ownership of a peculiar character, even if by any interference by any one, that property was even improved in metemetary value, and its existing sentimental value impaired, that supposed increased value would have to be rejected. In support of his argument Mr. Pollard cited the claim made by the Duke of Buccleuch in respect to Montague House. In that case £5,000 was awarded by Mr. Baron Pollock as umpire in respect to sentimental value, as shown in the evidence of the Umpire on p. 422 of the Law Reports of English and Irish Appeals. Though the circumstances in this case were different, the point in question was the same. The claim made by the Duke was founded on sentimental depreciation, notwithstanding that that property would have produced more money let as offices, &c., or building ground. The residential qualities were, however, here destroyed by the frontage to the Thames being taken away, and, after considerable difficulties in law had been overcome, the award of Mr. Baron Pollock in favour of the claimant was supported. In this case not only was the value of the frontage to the river destroyed by the presence of these manholes, but the privacy was taken away. After dwelling on matters which were contended to interfere with claimant's privacy, the learned counsel concluded by drawing the attention of the umpire to the damage done during the construction and repairs. Evidence was then taken. For the claimant, Mr. W. J. Beadel, of the firm of Beadel and Co., Gresham-street, estimated the total value of the estate at £125,000, and the depreciation consequent upon the sewerage works, at £20,000. In cross-examination he said: The park is 700 acres in extent. I do not know how much land is in the occupation of Sir William Hart Dyke. 2,000 acres is my estimate of the quantity that should go with the Castle. If purchasing this land I should expect to get it for £20,000 less now that the sewer is down. I am certain it would fetch £10,000 less. This depreciation in value is not only on the ground, but on its privacy and sentimental value. If it were sold for building purposes its value probably would be increased, but I doubt it in that part of the country. I do not say that at the present moment it would fetch a fancy price. I think there is a temporary depression, and therefore take five years. I put before the umpire £10,000 certain, and £20,000 in my judgment; and £1,000 as compensation for inconvenience during construction and repair. Mr. R. L. Cobb, of Higham, estimated the depreciation in value at £16,000. Mr. W. Hodson, Farningham, placed his valuation at 15 per cent. and five years' purchase, or £19,540. He added: I think the number of buyers if the estate were for sale would be decreased to the extent of an equivalent to five years' purchase less. I think the very site of this sewer would deter any one from taking it. As to the amount of compensation due to Sir William Hart Dyke, we have agreed to set the figure at £1,000, but in my opinion that is insufficient. If the Castle had been let during the summer, it would have produced a larger sum than that. For the board, Mr. E. Tewson, of the firm of Debenham, Tewson, Farmer, and Bridgewater, said: I have divided the course of the sewer, and find that there are 60 chains through the park. Then there are 60 chains outside the park to the village, and 17½ chains through Mrs. Mandey's field. 60 chains equal three acres, which I put at £150 per acre = £450. There are 14 manholes, 10 of which have gratings, and 4 stone covers. In dealing with these manholes—so far as my experience has gone—£10 per manhole has usually been allowed, but these being through this park, I put them at £20, making for them a compensation of £280. Then the 60 chains through the village, with a half-chain wide, equal 3 acres, which I put at £75 an acre, equalling £225. There are 11 manholes, which I have taken at £10, equalling £113, and 17½ through Mrs. Mandey's field, equal 3r. 20p. I put that at £100 per acre, £37 10s.; with 5 manholes at £10, or £50. In consideration of the possible depreciation in the estate through the right of privacy being interfered with, I have given £1,500. I believe the land itself would let for exactly the same; the only depreciation being compensated for at £1,500. I could, I think, deal for less money. In consideration of any inconvenience which Sir William Hart Dyke may have been put to, before I had heard the evidence of witnesses on the other side, I had put the figure at £500. I confine myself to estimated damages actually sustained, and have paid no regard to sentimental damage; my total estimation of compensation is £3,202 10s. I do not think that the estate would be materially affected in its saleable value. If the estate was brought into the market an extra buyer might be found for it. I remember several cases where large properties have been sold, and I am not aware that in any case they have been more valuable on account of their historical associations

unless the estates possessed some social attraction—more, at any rate, than this does. As to the fishing, I don't think there is any great depreciation in value. If it possessed things that you could carry away—such as pictures and engravings—and place in a museum, it might have some appreciable value, but I don't think that you could get money for those at Lullingstone. If you sell them you must sell them damaged. You would not get much money for them. In my opinion, the amount I give as estimated damage is, I think, full compensation. In cross-examination, the following questions were put to the witness: Have you never heard of property making more on account of the nature of its historical associations?—I have tried over and over again, but I have never succeeded in getting an exceptional price on account of that. You have then tried to obtain a fancy price on account of historical associations?—It is my duty to describe property as it is, and this I endeavour to do. If I get a mansion with modern convenience and comfort upon an old site, that is the place I find will sell. Mr. Virgoe Buckland, land agent and surveyor, 65, Cannon-street, E.C., put his estimate at £3,302, and Mr. George Langridge, of Tunbridge Wells, gave his as £3,192 10s. The latter was asked: Do you think that the property is deteriorated by the sewer? His answer was: I think so far as its antiquarian associations are interfered with it is not. I think £1,500 represents the damage for interference with privacy and sentimental dread of the presence of these sewers. The damage is to the privacy, but it is well compensated for by my total amount. Mr. Joseph Tootell, land agent and surveyor, Maldstone, estimated the damage at £3,005. Cross-examined: Do you think that £500 is sufficient compensation for the injury done to the residential rights? I think if Sir William had been put to such inconvenience as to prevent him being able to stay there, he would have gone away and charged the board with the expense. I think £500 is fair compensation for injury to residential enjoyment. I have known places with antiquarian associations, but have not known a precisely similar case to this. Mr. Thomas Hennell, C.E., 8, Delahay-street, Westminster, was called and gave evidence as to the (1 in 500) level, depth, and position of the sewer where it affected claimant's property. All the manholes near the Castle, he said, were covered with stone slabs, and there would not be any necessity to uncover them. There would be a quantity of spring water pass into the sewer with the sewerage of Shoreham and other places that was conveyed through it. The course of the sewer was selected in regard to the levels and the character of the property. As to the embankment mentioned by counsel and witnesses for claimant, it was simply an old stopped up road, grass having grown upon it. By the insertion of this sewer in Sir William Hart Dyke's land, Lullingstone Castle would be benefited. At present the provision for the conveyance of sewage from the Castle was inadequate. This was the whole of the evidence, and counsel having addressed the Court, the adjournment was made, the Umpire taking time to consider his award.

CHIPS.

The Epsom highway board have received 121 applications for the vacant office of surveyor, and have referred the mass of letters and testimonials to a committee to sift out the less eligible candidates.

Waterworks extensions are being carried out at Bury St. Edmund's, by Messrs. Pontifex and Wood, of London.

The Okehampton local board, at their last meeting, adopted plans for main sewerage prepared by Mr. Martin, with an outfall at Brays Hams. The estimated cost is £1,000.

The Episcopal parish-church of Lurgan, in the diocese of Kilmore, was reopened on the 1st inst., after restoration carried out at the cost of the Marquis of Headfort. The old pews have been replaced by open ones of pitch-pine, with choir-stalls in the chancel, and new heating apparatus, pulpit, reading-desk, and a stained-glass window illustrative of the 23rd Psalm, have been supplied. Mr. J. H. Fullerton, of Armagh, was the architect, and Messrs. Irwin Brothers, of Ballibay, were the builders.

By order of the Metropolitan Board of Works, Oxford-street has recently been renumbered. It has been calculated by a correspondent of the *Times* that this will cost the inhabitants at least £10,000 for alterations to shop fronts, stationery, &c.

At a meeting of the Eastbourne local board on Monday the salary of Mr. Tomes, the surveyor, was raised from £275 to £375.

The contract of Mr. J. Herd has been accepted by the Corporation of Manchester to erect the new swimming-bath for women at Leef-street for a sum of £4,677.

Our Office Table.

PREPARATIONS are being made for widening Fleet-street from Chancery-lane to the corner of Bell-yard, and in the demolition of the block of houses two places of interest will be "improved" from this thoroughfare. One of these is the old Cock Tavern, long associated with the names of Johnson, Boswell, Goldsmith, Steele, and Addison. The other is the house of Isaac Walton. The house where Walton lived stands as it stood in 1721, when he entered upon its occupation. Its identity is clearly established by the parish-books of St. Dunstan's, as well as by deeds. The "Compliment Angler" was first published in the parish where it was probably written, and where he had lived—St. Dunstan's—the first edition bearing this imprint:—"London, printed by T. Maxes, for Rich. Marriott, in St. Dunstan's Churchyard, Fleet-street, 1653." The setting back of this block of houses and the widening of Fleet-street at this part have become the more necessary since the obstruction caused by the "Griffin."

AN International Geographical Congress and Exhibition was opened at Venice last week, and remains open till the 22nd. England is poorly represented by a few maps and charts from the Ordnance Survey and the Admiralty and a few books. The Survey of India has sent a very large and splendid collection. The great theodolite of the Indian Survey has been erected, and an Isin, and a thin theodolite have also been set up. In addition to ten surveying instruments of good size, a very large self-registering tide-gauge will be seen at work, registering the tide at Venice, and driven by its own clock. Similar exhibits of a self-registering aneroid and a self-registering anemometer will also be made. India has also sent many maps and charts and publications from the Marine Society of India. The English Commissioners are Lord Aberdeen, president of the Royal Geographical Society, Sir H. Layard, and Mr. H. Bell. The Government of India Commissioners are General Sir H. L. Thuijler, C.S.I., late Surveyor-General of India; Colonel C. T. Haig, R.E., and Captain A. W. Baird, R.E., of the Indian Survey.

ONE of the sculptors who competed for the supply of the statuary for Blackfriars Bridge writes to the *City Press*, complaining of the "scant courtesy" shown to the competitors. Among other things, he points out that over five months have been allowed to pass since the models were placed for inspection at the Guildhall, and he fears "the older competitors may go to their graves in happy ignorance of the decision arrived at by the committee after their lengthened deliberations." We have heard that the award has been made, but that some inexplicable unwillingness to make it public seems to exist on the part of the City authorities.

THE fifth annual fine-art exhibition at Dundee will be opened by the Earl of Dalhousie on October 1st. In addition to paintings and sculpture, etchings and drawings in black and white are to be included and made a special feature. A large number of works have been contributed by artists, and Messrs. Agnew and Sons are to lend Mr. Holman Hunt's "Shadow of the Cross." Former Dundee exhibitions have been attended with considerable success, the sales from last year's amounting to £5,000, a larger amount relatively to the population than has been realised at any other provincial exhibition.

THING is a report, according to the *Athenaeum*, that Mr. Shields has given up his share in the series of decorative pictures in the great Chamber of the Town-hall, Manchester, where Mr. F. Madox Brown has been painting for some time past. Mr. Shields's large commissions from the Duke of Westminster for stained glass to be placed at Eaton Hall, which we described some time ago, have compelled him to concentrate his attention on that work. The *Athenaeum*, while regretting extremely to hear that the report in question is correct, thinks still it might supply the problem of how the very different works of two painters would agree in one room were Mr. Brown allowed to execute the entire series of twelve pictures.

THE seventh of the annual exhibitions of pictures promoted by the Corporation of Liverpool was opened to the public on Monday. The

galleries contain 1,435 as compared with 1,081 last year, when the size of the pictures, generally speaking, was greater than on the present occasion, the number being consequently less. Compared with previous exhibitions, this is pronounced the best hitherto held, there being a full complement of pictures from the Royal Academy, including specimens by the leading Academicians themselves, while the tone of the works, as a whole, shows an advance both in strength of treatment and in variety of subject. The most noteworthy painting in the collection is Mr. D. G. Rossetti's "Dante's Dream." This work is of very large size, and has never been exhibited in public before, having left the artist's studio to come direct to Liverpool. The exhibition is unusually strong in water-colours, in which branch of art the Liverpool school is well to the front. Of sculpture there are fewer examples than usual.

LORD BRADFORD, on Monday, opened an exhibition of fine-art treasures in Balton New Infirmary. The building adjoins the public park, and has cost £20,000, exclusive of fittings. It has accommodation for 75 beds. Donations promised towards the building and endowment amount to £35,000, of which £2,000 was contributed by the working classes. The exhibition was originated by the late Mr. Selim Rothwell, artist, Manchester, and the collection consists of 1,600 paintings, etchings, engravings, and pieces of sculpture and bronzes hung and arranged in 31 rooms and five corridors. There are loans of pottery, coins, and ancient armour. The exhibition will remain open two months.

WE regret to have to announce the death of William Edgecombe Rendle, of Westminster (formerly of Plymouth), who expired on the 3rd instant at Eastbourne, after a long and severe illness, and was interred yesterday (Thursday) at the Brompton Cemetery. He was born at Compton Giffard, near Plymouth, on February 10th, 1820. He was engaged in several large mercantile pursuits, and was patentee and inventor of what is now known as Rendle's Patent Glazing, which is adopted by H.M. Government and all the leading railways, his latest and largest work being the great Citadel Station at Carlisle. He was also successful in theatrical matters, and was partner with Mr. Augustus Harris at Drury Lane Theatre, when the great piece "The World" was produced. He was also lessee of the Imperial Theatre, Westminster, and proprietor of the Clarendon Hotel, Brighton.

LONDON is already rich in parks, but the need of additions in this respect is ever-growing, like its immense population. Hence the prospect of a new park being provided for Paddington is hailed with general satisfaction amongst all who are interested in the development of these lungs of the great city. The fund for this object has been raised to £32,100 by the offer of a gentleman well known for his wealth and liberality to contribute the munificent sum of £10,000. It is expected that ere long the sum required will have been obtained.

THE exhibition at the Berlin Royal Academy was opened on Monday. The galleries contain 1,100 objects, but, with few exceptions, the great masters are unrepresented. Andrea Achenbach, Vaelao Brozik, Böcklin, Defregger, Knaus, Gabriel Max, Makart, Mankacz, Vautier, and many others of like merit, are conspicuous by their absence. Alma Tadema and Gustav Richter (whose hourly-expected death was prematurely announced a few days ago), Anton von Werner, Gussow, and some other names of note remind one of the time when the exhibition of the Berlin Royal Academy was an event interesting to all lovers of German art. Part of the blame for the mediocrity of the present exhibition is ascribed to the jury, which accepts, without the slightest discrimination, all the objects sent.

MEDIAEVAL wills often mention the bed and bedstead as a bequest of value, but the windows of a dwelling-house are not frequently included among the legacies. The late General Patterson, of Philadelphia, however, has provided in his will, just admitted to probate, for the retention of the "Washington glasses" in his family. The concluding paragraph is in these words: "That the Washington glasses, now in my residence, at Thirteenth and Locust Streets, Philadelphia, being the same which were set in the walls of

General Washington's house, upon Market Street, and which I purchased and had reframed and set up in my house on Arch Street more than fifty years ago, and thence removed them in the year 1836 to my present residence, shall remain where they now are so long as any of my descendants shall continue to occupy the residence." Upon the sale of the house, the glasses are to go to his son Robert, afterward to his grandson Frank, and then, it is declared, "it is my wish and hope that my said grandson will provide for the transmission of the said glasses to his own children, if he shall have any, or to some other of my descendants, so that the same shall forever hereafter remain as heirlooms in the possession of some one of my descendants."

THE PARKES MUSEUM is closed until the end of September. In October it will again be opened free to the public on Tuesdays, Thursdays, and Saturdays, and during the winter lectures on sanitary science will be given in the museum. The lectures will be illustrated with the sanitary appliances deposited in the museum, which now include many new contributions sent from the recent Medical and Sanitary Exhibition at South Kensington. We believe it is intended to distribute the awards to the exhibitors at the exhibition at the second public annual meeting of the subscribers to the museum in October or November.

MR. A. WATEHOUSE, A.R.A., says the *Guardian*, whose masterpiece at South Kensington, the Natural History Museum, is so great an addition to our public buildings, has recently realised a much smaller design, but one of considerable comfort to those who are looking for the growth of a new style of architecture. This is a corner shop, or house and shop, No. 1, New Bond-street. A walk down Bond-street, indeed, ought to convince any one whose antiquarian bias is not too great to be compatible with impartial criticism, that the modern urban architecture of London is by no means to be despised in places where money is "no object."

WITH reference to the New Law Courts, the London correspondent of the *Leeds Mercury* says: "It is interesting, but not satisfactory, to learn that the constant conflicts between the architect and the Office of Works have resulted in the double result of producing a building with which neither is satisfied. Mr. Street was forced to abandon, for motives of economy, and at the bidding of Mr. Layard, then Chief Commissioner of Works, the central tower, which was the chief ornament and culminating point of his design; whilst Mr. Street, forgetful of the wants of public officials, has constructed a large number of his rooms in such a way that gas will be required to be permanently used in them."

MR. WINTER JONES, F.S.A., late Principal Librarian of the British Museum, died suddenly on Wednesday morning at his residence at Henley-on-Thames. His last literary effort, recently privately printed, was a sketch of the Assyrian and Babylonian excavations undertaken for the British Museum, which formed the substance of a lecture delivered by him at Penzance a few months ago. The results of Mr. Rassam's latest researches were so attractive to him that they became the subject of a lively conversation which he led on the eve of his death. It should be added that Mr. Winter Jones prided himself among his literary friends on being the descendant of the author of "Goody Two-shoes."

MESSRS. MORRIS and TASKER have completed a lighthouse for Sesapeake Bay, off Cape Henry. The new lighthouse measures 155ft. from base to top, with a diameter at the base of 30ft., and at the top of 16ft. There are six stories, above which are a service-room, watch-room, lantern-room, and finally the roof. The total weight of the lighthouse is 1,700,000lb., 7,000lb. of bolts alone being required to put it together. The exterior, which is octagonal in shape, is constructed of cast iron, while the cylindrical interior is of sheet-iron. The castings of the base and first story are 2in. in thickness, and the sheet-iron lining is 3in. The staircase, which has 180 steps, goes around the cylinder instead of up a shaft, as in the lighthouses now in existence. The light-room is a circular steel frame, 12ft. in diameter and 9ft. high. The glass to be used is now being manufactured in France, and a light of great power will be adopted. Every story is solidly bolted together by heavy cast-iron floor-plates, 11in. thick, while the points and facings are finely planed.

THE BUILDING NEWS.

LONDON, FRIDAY, SEPTEMBER 16, 1881.

THE DESTRUCTION OF THE PARK THEATRE, AND ITS LESSONS.

LAST week we made some observations touching two recent fires which destroyed a large warehouse and a dwelling; we have now to chronicle the destruction by fire of a theatre at Camden Town, which occurred early last Sunday morning. The Park Theatre was originally known as the "Alexandra," and was a building of comparatively recent construction, the design having been furnished by the late Mr. H. C. Robinson, architect to the Lord Chamberlain's department. The Park Theatre stood in the centre of a block of dwelling-houses and shops, bounded by the High-street, Camden Town, on the east side, and by Park-street, Arlington-road, and Wellington-street on the three other sides. The houses backed to the theatre, and its main entrance was in Park-street, the gallery entrance being in Arlington-road. An area intervened between the main theatre and the backs of the houses on these sides, and but for this provision the property adjoining in some parts would have been placed in imminent danger. It is needless to dwell on the particulars of the fire already published; suffice to remark that soon after the termination of the performance, the building was discovered to be on fire at the stage end, and in less than one hour, in spite of all the water thrown into the building from every point of vantage and the untiring exertions of the fire-brigade, the flames obtained complete possession of the building, and enveloped it on every side. So thoroughly was the work of destruction wrought, that by the time the fire was got under the theatre was gutted, and nothing was left standing of the structure in the early morning of Sunday but the outer brick shell of the building. Of the interior, the only remaining objects are the iron pillars which supported the balcony and dress-circle, and these have been twisted and bent into every conceivable shape. The official report of Capt. Shaw gives the size of the theatre as about 160ft. by 80ft. Where and how the fire originated is not yet known, though it is supposed it must have commenced in one of the dressing-rooms in the upper part of the stage.

The burning of the Park Theatre is an event that will once more draw attention to a few points of consideration which are worth dwelling upon. Of these the situation and surroundings of the building, its total destruction, and the means of egress, are important. The theatre, as we have said, was built in an area surrounded by dwelling-houses and shops, a mode of construction open to serious risks. That the surrounding houses were not damaged to a greater extent than they were was attributable mainly to the means adopted by the brigade to confine the flames within the four walls of the building. A strong wind blowing in any direction would have entailed an amount of damage to property and life it would have been serious to contemplate. Theatres are generally built in crowded localities of this sort; the auditorium, and often the stage, as in the present instance, are hidden from view by the houses which cluster round them, while they are connected by the entrances with the streets. Some time ago we called attention to the code of rules framed by the Metropolitan Board of Works, in which it was laid down that all plans of public

buildings of this class should be examined. It is well to remember, as Mr. Hollingshead, the lessee of the Gaiety, informed the Select Committee on this question, that the theatres and music-halls of London were amenable to no less than six different jurisdictions. One of the regulations of the Board has reference to the position of such places in relation to adjacent premises. Plans for this purpose have to be drawn to a scale of 1in. to 20ft. The numbers to be accommodated in the different parts of the house are required, and the area to be assigned to each person is not to be less than 1ft. 6in. by 1ft. 6in. in the galleries, nor less than 2ft. 4in. by 1ft. 6in. in the other parts of the house. With regard to exits, there is a clause prescribing that provision is to be made for a separate means of exit to each floor communicating directly with the street, and of a certain width, and each tier of boxes is counted a floor for this purpose. If these regulations had been in operation the Park Theatre would never have been situated or built as it is, where full houses are nightly penned in by dwellings on all sides with only two narrow means of exit.

The complete burning out of the building within two hours is a more significant fact, and one which suggests several inquiries regarding the construction of a building capable of being so wholly destroyed as the Park Theatre has been. Hardly a vestige of the interior remains. Captain Shaw, in his useful hints on theatres, so often noticed in these pages, requires that every department of a theatre should be inclosed within fireproof walls, and be capable of being shut off entirely from the stage or auditorium in case of a panic or fire. Each passage and stairs would then be rendered tolerably secure, even if the auditorium or stage were in flames, and escape rendered easy. The proscenium-wall would be carried up above the roof and have a metal curtain at the opening, while the smaller openings would be closed by iron doors. We may ask here, whether these or similar precautions were made at the Park Theatre, and if not, why not?

The theatre was only built about ten years ago, and the designs were prepared by the architect of the Lord Chamberlain's department. It is rather remarkable, at least, that there seems to have been no means of shutting off the stage or the portion found on fire from the other parts of the theatre. If there were iron doors, why were they not closed after the performance?—why was the entire area of the auditorium left to the flames? It is fearful to think of the consequences that would have followed if the audience had been still within the walls, or even making their way out. The same rapidity of the devouring element would have been present, with less facilities for effective working, for, in all probability, a panic of a frightful kind would have ensued on the first appearance of danger. A horrible sight of burned and suffocated beings would have told the tale in the early morning, only paralleled by the dreadful sacrifice of life at the Brooklyn Theatre still within remembrance. It is almost ironical now to ask whether the rules required by the Lord Chamberlain's licence had been observed: such, for example, that all doors and barriers opened outwards; that all gangways, passages, and stairs were kept entirely free for the unimpeded rush of the audience; that at least two means of exit were provided; that ample water supply and hose were in readiness; that wire-guards protected all gas-burners and foot-lights; and whether the other regulations to insure safety of life and property had been complied with. These are points which, since the damage has been done, have little direct bearing upon the case; but if life had been sacrificed, they would have acquired a hundredfold more importance. It is signifi-

cant, however, that before the engines could be got to work, the fire had actually spread to the upper boxes and gallery, and was fast overspreading the pit and stage, and this only a few minutes after the alarm was given. We indeed await with interest an explanation of the possibility of a theatre being so completely gutted in so short a space of time, if only the barest precautions were exercised in closing off the stage from the auditorium. The flames appear, from the first, to have been unimpeded in their course, leaping forward from tier to tier till the whole of the auditorium was in one blaze. The falling in of the roof, of course, finished the work of destruction.

Had a panic of the audience occurred, as it might have done, with its fearful tale of sacrifice, the question of the entrances would have been one of considerable moment. There were only two entrances, the main one in Park-street being as wide as such entrances generally are, though insufficient, and these led by low-covered buildings to the main structure. There were no apparent means of making an escape from the upper tiers and balcony without descending stairs in the building; and, in spite of the directness of the corridors, we do not see what check to the flames was within reach of those in charge, if the fire had taken place under the circumstances we have supposed. The store-rooms, in one of which the fire is thought to have commenced, ought to have been entirely shut off from the stage; but nothing of the kind seems to have been thought of. With regard to the ordinary regulations in force, we do not hear much. It, no doubt, ought to be required that, immediately after the performances are ended, the theatre should be carefully inspected, and all lights extinguished; the supply-valves of the water-mains and all hydrants and hose should be tested. Then all the parts of the theatre, or the several "risks," as Captain Shaw has pointed out, should be properly separated by iron doors, or other means, and especially that the stage opening should be closed by a curtain of iron.

The question of a local staff of competent firemen is one we have before pointed out, and Captain Shaw's ideas on this point are pretty well known to our readers. No manager ought to be allowed to open his doors without a staff of able attendants, and as Captain Shaw suggests, a sufficient attendance of real firemen should be one of the conditions of the licence, these firemen being obtained from the fire-brigade station of the place. On the Continent a fire-watch is thus secured for every theatre, and till our theatres are protected by a "watch" of trained firemen under the manager's direction, who know every nook and corner of the building, and are made responsible for its safety, we shall always be in a perpetual state of alarm and uneasiness about the safety even of an empty theatre left, without due charge, to the tender mercies of some tired official, or even to the carelessness of the last worn-out player who leaves the building. The burning of the Park Theatre is sufficient warning of the imminent danger to which people are subject living in crowded neighbourhoods near these places of public resort, and we hope the attention of managers will be called to the subject once more.

NEW BUILDINGS AT THE WEST END.

TO judge from a few instances of recent taste in the construction of buildings of a commercial character, the stately stone front, with its colourless Classic details, has been set aside for the rival claims of a less dignified but more picturesque modification of a vernacular brick style. It is no longer a question whether Classic or Gothic is the

more national style for building in, or which of them has the stronger claim on our regard, for Gothicism, as we have long predicted, from its utter inability to meet the requirements of modern commercial, and, to a certain extent, of domestic wants, has been relegated to the one sphere with which its sympathies have been so long associated. It is hardly, indeed, a question of style at all, but rather of the most pliable form of using material. The battle-ground has changed somewhat, for we hear no more wrangling about which style is the most national, but which is the most appropriate. The propriety of this or that form of roof and window turns now upon more practical considerations than it did when compliance with certain historical precedents was demanded; and, in a word, the more exalted question of an architectural creed or policy is left to theorists and amateurs to quibble over. Sentiment, as usual, has had much to do with bringing about the feeling for a domestic style of building which employs the materials ready to our hand, and this reliance upon our own resources, rather than upon Classical precedent, has a healthy look about it.

Pall Mall has changed but little since the Regency, and the art traditions of classic Italy still seem to cling to it. We can barely conjecture what it was like in the days of Pepys, when it had a "sweet shady side" of stately elms, with a few brick mansions on the south side. Many of the old brick 17th-century houses have been transformed. Nell Gwynne lived here, and in Mr. Craze's collection there is a view of her residence, and also of Schomberg House, as they appeared in 1820. Another example of the old brick buildings may be seen in a drawing of Christie and Manson's auction-rooms, also in Mr. Craze's possession. The style of building was at this time a rather unbending kind of Classic of red brick and stone, such as we see in the representations of old Marlborough House as it appeared in 1710; we call it "Queen Anne," and perhaps no better example of the style exists, as that house was built by Wren. After nearly two hundred years we are reproducing the very lineaments of this style, though occasionally the stone dressings are replaced by terra-cotta. Let us take a rapid review of new work in the locality. We first refer to a large building at the eastern end of Pall Mall, now in progress for the West-end branch of the Life Association of Scotland. It is entirely fronted with stone, and will comprise two shops on the ground-floor and offices above. Mr. Alex. Peables is the architect. Compared with the older brick Classic of this part, it affords some points of contrast. The façade has been treated in the academic fashion; there is one large order, Corinthian, in the front, supporting an entablature and attic above. Two three-quarter columns in the centre and end pilasters, with pedimented windows between, are the leading features of the design, a view of which was exhibited in the Royal Academy of this year.

Regent-street has not shown many signs of progress in architectural improvement since the days of its designer, John Nash. We recently spoke in praise of Messrs. Howell and James's new front to their premises, in which red brick and terra-cotta of a light salmon colour have been very tastefully combined, and this is the only recent building which has broken away from the Classical trammels. Since it has been completed, we can speak of its treatment more confidently. As a design in a modern Renaissance spirit it is a success; the parts are well connected; but it is chiefly as an experiment in colour we now refer to it. The vertical piers between the windows in red brick make a pleasant harmony with the

warm salmon tint of the terra-cotta which has been used in the horizontal members, the window-heads, balconette, pediments and cornices, and dormer-gables. The light mullions, with their green painted frames, afford a very agreeable relief to the eye, and supply the corrective to the bright red tints. How long a London atmosphere will spare the freshness of the brickwork is a matter of doubt.

In Piccadilly another effort to introduce colour and to depart from the beaten track has been made by Mr. Waterhouse in some corner shops and offices at the end of Old Bond-street. A Domestic Renaissance character has been given to the building, which we have before referred to. The windows have mullions and jambs of a warm terra-cotta, and the same material has been used entirely in the angular projecting bay which is carried up, and partially in the walls and horizontal features. The stamped or cast ornamentation which Mr. Waterhouse employed in the Prudential Offices, Holborn, and to a larger scale in the Natural History Museum at South Kensington, is employed here also in the bay and the stringcourses. The dark brown or purplish bricks, and the lighter warm stone-colour of the terra-cotta work produce a harmonious result; though somewhat marred by the heavy shop-front treatment below.

In New Bond-street the plain brick and stucco fronts are gradually giving way to the introduction of the new style, and in many of these façades the thoroughly Domestic features in vogue when Queen Anne and Dutch William reigned have been called into requisition. We have already described the principal buildings in this street, and our back volumes contain views of some of them. An extensive area of ground is now vacant in Piccadilly, near St. James's Church, intended as the site for new galleries for the Institute of Painters in Water-Colours, and also for a concert-hall and shops. In a notice of the last exhibition we gave a description of what the promoters intend; and, with regard to the architectural character of the new façade, we believe we are right in saying it will be in a free Italian or Renaissance style. At the corner of Gilbert-street and Oxford-street we see a block of new shops and chambers, designed in the "Queen Anne," but essentially unpoetic in its spirit. The red brickwork is tuck-pointed, with white joints, the proportions of the upper stories and dormers certainly look out of scale and crushing, and there appears to have been a desire to make the most of every feature. The dormer-gables are very narrow, and crowded at the side, the carved brick stringcourse is quite as heavy and deep as the main cornice, which has festoons in the frieze, and it would have been infinitely better if either the stringcourse or the cornice had been omitted. Swags of foliage are carved over the first-floor windows. The front towards Oxford-street has a stilted-looking gable, with an arched recess and a corbelled flat-curved oriel window; but the manner the shop-front and the angle are treated is unsatisfactory. The windows of the shops have flat arches, cut out of a deep frieze of polished granite of a dark warm colour, and above this a black marble polished cornice cuts off the red work over. The first floor is rather crushed in appearance, which is due to a want of gradation.

The old-fashioned aristocratic squares are here and there invaded by the modern builder. We see in Berkeley-square, for instance, an important block of new mansions just finishing from the designs of Mr. Wimperis. The style we may rather designate Anglo or Neo-Classic than Queen Anne, though the design is evidently conceived in that spirit. There is an octagon turret at the corner finished with a lead

eupola of ogee shape. The lower story of this turret forms an angular entrance, the projecting roof or porch of which we hardly think improves the design. Two brick gables face the square; these are varied, one having carved brick ornament. The terra-cotta balconies have a somewhat disconnected appearance, and we find fault with the circular oriel balcony on its single corbel, but the whole design may be taken as a fair example of a modern version of the brick architecture of the 17th century, shorn of its quaintness and simplicity, and of much of the detail which gives the old work its picturesque character.

In the neighbourhood of the square we note a small church, now building, in red brick, by Mr. A. W. Blomfield. It has a short nave and well proportioned chancel with side aisles (the northern being a passage aisle), pierced with windows of simple Geometric character. There is a large triplet under an outer arch at the east-end, and the west front is relieved by a stone mullioned window, and with bands of stone. At the corner is a tower of brickwork relieved by stone, and intended to be finished with a low roof, the grouping of which will be simple and pleasing. We illustrated the interior of this church Dec. 24, 1880.

DECORATIVE ART.

THERE are two distinct schools of decoration which have been followed by our modern artists and art-manufacturers. One of these schools takes Nature as its standard and tries to keep very close to the natural forms; it is strong in individuality of expression, though its work is oftentimes no better than a feeble kind of "high art" which it affects to rejoice in. The other school, that of the Idealist, while also acknowledging the methods of Nature, denies that he is bound to accept her as his only guide, and seeks to make his art conformable to other laws, which he believes are of equal force in interpreting the object of his design. This school often falls into lifeless platitudes and a spiritless academicism. The two kinds of artists differ practically only as to the limits of nature and the imagination, and we shall find that both the "realist" and "idealist" agree to study Nature. The whole subject of art is, in some measure, involved in the question; but it has a more practical bearing for the artist and manufacturer. It is proper for artists to understand at the outset the fundamental principles upon which they work, partly by habit, but perhaps more from temperament; for it will be a long time before art, as the embodiment of sensuous pleasure, is thoroughly understood to be the result of particular vibrations conveyed to the nerves of the eye and ear, seeing that the most devoted masters and enthusiasts are not yet willing to admit a physical basis for their preferences, even in spite of what Helmholtz has demonstrated with regard to musical notes, and M. Veron and Spencer have shown in their essays on art.

It is at least important to understand, for instance, why the cover of a book is more artistic, when the ornament is of a conventional or non-naturalistic kind, than when it is stamped or impressed with unmeaning wreaths of flowers or leaves; or why our wall-papers and carpets are more in keeping with the dictates of correct taste when their surfaces are relieved by flat patterns dictated by the fabric and by colours which harmonise with the surroundings of the apartment. The geometrical distribution of foliage, especially of that kind which the Japanese artist has taught us in the varied disposition of his diapers and medallion ornamentation, and the harmonious blending of colours such as he has shown in his charming faience and lacquer work,

appear to offer the nearest approach to decoration in which both the principles mentioned have been exemplified. Few of the admirers of naturalism in art can object to a treatment which gives ample play for the imitation of natural forms, and we do not think the conventionalist will be disposed to undervalue the exquisite sense of creative fancy displayed in some of these productions. The Oriental textiles furnish the most beautiful examples of the law of adaptation of natural objects to works of art, and we find one of our leading art-manufacturers of the West-end following this *motif* of design in the production of wall-hangings, carpets, and chintzes, in which flowers, fruit, and foliage of English growth are treated with a naturalness and individuality of type, yet preserving an artificial arrangement of a purely conventional or geometrical character. The chrysanthemum and tulip, the apple and mistletoe, are types we have seen treated in this manner. Since all surface ornament has to be repeated, as in the case of a wall paper, the proper degree of naturalness compatible with this kind of distribution is a matter of the first consideration. It may be taken as a principle of general application that the greater the repetition the less natural ought to be the treatment. A natural type always loses by repetition. Many other reasons may be given for assuming that a conventional or ideal treatment of ornament is one which most strictly follows the method of Nature; and the real issue between the disputants of the two schools of decorative art appears to be that while one copies Nature as he sees it, the other studies her methods and true spirit.

The true characteristics of decorative art can only be understood by distinguishing clearly the limits of these principles—in fact, by defining those modes of arrangement which separate decorative from “expressive” art. Decorative art has been well defined by Veron in his admirable work on æsthetics as being “achieved mainly by arrangement of line, form, colour, sound, rhythm, movement, light and shade, without any necessity for the intervention of idea or sentiment.” “The arts of design are, therefore, not the only ones which may have a decorative character. It is to be found in the dance, in music, poetry, and in rhetoric. Our ballet measures are nothing but decorative dancing, with the one object to please the eye.” The same author, however, seems to place decorative art in a lower category than has been assigned to it, and it is probably the endeavour of late to revive what is called “high art,” that has made decorative artists impatient of the limits and necessary trammels imposed on decorative design. They like to introduce images, ideas, and sentiments into their work and to this extent they fail to give us purely decorative character. Greek art was purely decorative in its feelings, we mean that which has ever remained subordinate to architecture. It was perfection and grace of outline and form which were the aims of the Greek artist; even Greek sculpture was decorative, and the same spirit was rekindled by the artists of the Renaissance. The statues and Greek reliefs in which mythology and heroic scenes were introduced are thoroughly decorative. The attitudes of the figures, the movements and rhythm of the groups and the draperies were all designed with the same feeling. The most perfect physical types of beauty were chosen, and these were idealised, though M. Vernon asserts that such was not the case, that the sculptor copied the figure which he had before his eyes, the human form as he had pictured it. The beauty of a statue depends, says the same author, upon the refined interpretation of a beautiful form; but what is this but Nature idealised? The sculptural assessories of Greek architecture

afford abundant evidence of the theory of such a conception of physical beauty. No doubt the Greek sculptor, in his more expressive works, endeavoured to develop the personal and human form, but we are here speaking of decorative or symbolised sculpture. We are not saying that these works are to be copied implicitly by our artists. This indeed would be to ignore the very principles upon which the Greek artist worked; we should then indeed become the slaves of a despotic academism, which never has produced anything real or spirited. We only contend that the most perfect of natural forms, the central types of the human figure, were taken, and by a consummate mastery of contour, movement, rhythm, light and shade, these forms were made subordinate to the architectural composition. No doubt decorative sculpture has been always more or less symbolic: the Assyrian and Egyptian ornaments are so conceived, and in the Greek figures of Zeus, Athena, Hermes, or of Pan, the attributes of these gods are made prominent and distinctive. The bas-reliefs on the Temple of Theseus, and the pedimental sculpture of the temple of Ægina, are examples of decorative sculpture of the highest and most expressive character. We might instance the decorative art of the Renaissance as having been founded on principles derived from Greek art; but our main object is now to show that architectural decoration, including sculpture, has been long suffering from a confused view of the principles upon which the best examples have been designed, and that our ideals of decorative beauty in design have been solely derived from the antique, without a corresponding ability to use the methods the artists of the antique followed. Without this knowledge, all our copies and academic studies, and all the teaching given in our art schools, will be of little avail. We must train our art-students, especially those who will direct our manufactures, to become decorative artists, not imitationists or dabbles in “high art;” and to do this we must show them how to convert natural types into ornament which shall subserve the objects which it is intended to decorate. But a knowledge of natural types is useless if it leads to no other result than copying or reproducing them; it must be accompanied by an ability to idealise—the power of abstraction, or of seeing things in a sense removed from the visible and concrete manifestations in which they are presented to the eye. The greatest artists have been those who have been gifted with the power of “conventionalising,” as we term it; in other words, of abstracting the elements of natural types, and applying them in a decorative manner. Is it not this quality which has imbued the decorative works of Phidias with such inimitable beauty, which give the creations of Raphael, of Correggio, and Da Vinci their charm—which make us admire the decorative painting of Watteau and Boucher, and all the art of the 18th century? Except perhaps Stevens, we have had few modern decorative sculptors who are possessors of this gift.

THE WATER QUESTION.—XVI.

CONCRETE FOR EMBANKMENTS AND DAMS.

WHERE reservoirs are desired to be made in situations which afford no clay for puddle, and nothing but loose earth and stone for the embankment, the use of concrete may be extended, in forming the bulk of an embankment or dam. Where the range of stone is extensive and massive, and is bedded, it may be more advantageously cut into blocks for setting as proper masonry. The materials of the immediate site, whatever they are, are those only which can be used with economy for the

main portion of a reservoir embankment. Where these consist of stone, in any form, they may be used either by way of setting, in such blocks as can be procured, or they may be broken up for concrete and used for the bulk of the embankment. The material is heavier than earth, and less liable to slip, and for both these reasons it may be used in bulk of less magnitude, with the same degree of resistance.

Concrete may fairly be taken to weigh 120lb. per cubic foot at the least, and much more with some kinds of stone, while 96lb. per cubic foot is a heavy average for earth. The weights of stone of various kinds are approximately as follows, per cubic foot in the solid state, viz.: basalt, 180lb.; granite, 166lb.; mountain limestone, 170lb.; clay slate, 180lb.; trap, 170lb.; sandstone, 141lb. as an average, but some kinds are only 130lb.; chalk, 160lb. When broken up for concrete into pieces of about 4 cubic inches, the space occupied by a cubic foot of solid stone extends to about 1½ cubic feet, more or less as the pieces are moved about amongst each other so that the angles interlock, and the quantity of sand, or fine gravel and sand, with which the interstices may be filled, varies accordingly. The cementing substance required to combine the mass must be such as will set under water. The beds of blue-lias limestone furnish a hydrate of lime which has this property in a degree sufficient for the purpose; and so, indeed, have some parts of the Wenlock limestone and the gray chalk; but in other situations, where the cementing substance must be brought from a distance, Portland cement will be the most proper material, for the reason that the less the weight to be carried to the spot the better, and that Portland cement will bear a larger proportion of sand. River-sand, if clean, is better than pit-sand, but it is by no means safe to assume, as is sometimes done, that all river-sand is better than pit-sand, inasmuch as it often contains vegetable and animal fibre in injurious quantity, which cannot be separated from it by any ordinary or economical means. The only means of separating objectionable matter from sand to be used for mortar or concrete is washing it, and river-sand has already had, before it is procured, more washing than can be artificially given to it, and if the objectionable woody fibre, rags, wool, hair, &c., remain in it where it is procurable, they may be considered as being inseparable; and sand containing these, or any of them, in considerable quantity, is unfit for this purpose. The only way to get rid of the organic matter in river-sand would be to burn it out, but that would be a process too costly to be carried out. Pit-sand, on the contrary, is free from these, but contains too much earthy matter, which requires washing out of it. It is not always possible to do this entirely, with any degree of economy, for in many cases the quantity of clean sand left after the operation of thorough washing would be so small as not to be worth having at the price it would cost; and when neither clean river-sand nor good pit-sand is procurable, crushed sandstone may be used; but it is not a good material for the purpose, inasmuch as that any stone which can be crushed into sand contains much earthy matter. Sand procured in this way is, of course, costly, but even then it is not of good quality, and either of the other kinds is to be preferred to it, when cleansed. There is another source from which the necessary fine material for concrete may be procured. Clay may be burnt as it is dug out of the ground, at an almost small expense, and if well burnt may be crushed into a fine material resembling sand, which, although not so good a material as clean sand, is preferable to some others, inasmuch as it is absolutely clean; its fault is that it is absorbent, and, if not well burnt, too much so for use. Crushed

engine-cinders form another material of similar character, and equally good if procured clean, and consisting of engine-cinders only; house-ashes are, of course, inadmissible under any circumstances.

The immediate purpose for which concrete is intended to be used seems not to be always kept in view in specifying the proportions of its several components. Where it is used as a foundation to carry weight, or more properly to distribute weight over a larger area of foundation, much sand is to be avoided, inasmuch as it weakens the coherence of the materials as a whole. It is better in this case to use the cementing substance for the purpose of the adherence of the parts of the larger material to each other, and instead of driving them asunder by interposing sand, to bring them as close together as possible, and let each piece of the larger material be coated with its due proportion of cementing substance. If, after the larger material had been brought as nearly into contact as is practicable, the space of the remaining interstices could be known, they might with advantage be filled; but, as they could not be known, the probability is that, if filled at all, they would be over-filled, and the larger parts of the material driven asunder, so that it is probably better to avoid sand altogether. It is understood, and is to be insisted upon as a point of the very greatest importance, that the materials with which concrete is to be made must be clean; no good concrete, of any sort whatever, can be made without attention to this point.

But where concrete is intended to be used as a wall to prevent the passage of water, the interstices of the material require filling up, and it is important to know what relation of space they bear to the solid material, or to the whole mass, in order that they may be completely filled. Small angular stones lie closer together than rounded gravel-stones, if means are taken to press them together; but not so without such means. When loosely tipped in a heap, the interstices are larger with angular stones than with gravel, which, without ramming, settles itself to as great a degree of compactness as it is capable of; whereas the other material can be much compacted by ramming. Ramming clean gravel is detrimental rather than useful, inasmuch as it merely displaces the parts of the material without bringing them closer together as a whole. If the material be neither angular nor much rounded, as beach-shingle, it is of intermediate character in this respect, and may be rammed with some advantage.

If the material were perfect spheres the spaces amongst them could be calculated exactly, thus:

The distance, A B, Fig. 1, is the diameter of a ball; A C being half the diameter, and B C the transverse distance apart of the rows of balls, = $\sqrt{A B^2 - A C^2}$, the longitudinal distance being the diameter of a ball. In the vertical arrangement, Fig. 2, the height B C = $\sqrt{A B^2 - A C^2}$ as before, and the cubic space occupied by each ball is $A B \times B C$.

If the balls are 1 in. diameter, the distance B C = $\sqrt{1^2 - \frac{1}{4}} = \frac{\sqrt{3}}{2}$ in. The vertical height is the same, and the space occupied by one ball is $1 \times \frac{\sqrt{3}}{2} = \frac{\sqrt{3}}{2}$ cub. in. The 11 sphere, 1 in. diameter, is 523.6 cub. in., leaving a space around each ball of $\frac{\sqrt{3}}{2} = 0.866$ cub. in., and the ratio of the hollow space to the whole space occupied is 2264 to 523, or 30 per cent.

If the balls are 2 in. diameter, the distance apart of the rows of balls is $\sqrt{2^2 - 1^2} = 1.732$ in., both horizontally and vertically, and the space occupied by each ball is $2 \times (1.732)^2 = 6$ cub. in. The solid sphere is proportional to the cube of its diameter, or

to $2^3 = 8$, and is $5236 \times 8 = 4188$ cubic inches, and the ratio of the hollow space to the whole space occupied is 1812 to 6, or 30 per cent., as before. If the balls are 3 in. diameter, the percentage is the same. The distance apart of the rows is $\sqrt{3^2 - 1.5^2} = 2.598$ in., and

the space occupied by each ball is $3 \times 2.598^2 = 20.25$ cubic in. The solid sphere is $5236 \times 3^3 = 14137$ cubic inches, leaving a space around each ball of $20.25 - 14137 = 6.113$ cubic inches, and the ratio of the hollow space to the whole space is 6.113 to 20.25, or 30 per cent.

These may be compared with some recent trials of the proportions of sand and shingle at the Portsmouth Dockyard Extension works, given by Mr. C. Colson in a paper read at the Institution of Civil Engineers in February, 1881, where 15 samples of shingle of 1 cubic foot each, from various localities—viz., from Langston Harbour, Browdown, and Portsmouth Harbour, were tried, and which showed that it required, on the average of the 15 samples from the above-named localities, 38.4 per cent. of sand to fill the interstices, or 2.630 parts of shingle to 1 of sand. There was 53.3 per cent. of sand in the material as procured and used in the dock-walls and other parts of the work, or 1.875 of shingle to 1 of sand; but in the trials the quantity of sand was reduced to that which was sufficient only to fill the interstices of the shingle, with the above results. At the same time 26 trials were made of the quantity of cement required to fill the interstices of the sand for mortar, which showed a proportion of 36.4 parts of cement to 100 of sand, or 2.715 of sand, to 1 of cement.

Mr. G. F. Deacon, of Liverpool, made some trials of concrete used in the foundations of roadways, given in a paper read by him at the Institution in April, 1879. The concrete consisted of 8 parts of broken stone, 6 parts of gravel, and 1 of cement, making a mass, when mixed and beaten together, of 11 parts of stone and gravel to 1 of set cement; from which it would seem, the cement being included in the 11 parts, that it required 3 parts of gravel (containing half a part of cement) to fill the interstices of the broken stone, there being in the produced mass 3 parts of gravel more than was sufficient to fill the interstices. The percentage of space of the interstices of the broken stone to the whole mass was thus 3 to 11, or 27.27 per cent.

When the quantity of sand and cement is considerably in excess of that required to fill the interstices of the larger material, as in this latter case and in the walls of the Portsmouth dockyard extension, it takes the form of a matrix in which are embedded the larger pieces of material, and thus becomes or resembles rubble masonry, such as is found in the old castle-walls and Roman buildings, in which pieces of rough stone are embedded in a coarse mortar. This is the form which concrete walls should take which are intended to retain water in a reservoir. Concrete has not hitherto been used to form a reservoir embankment entirely, but during the last few years it has been used to protect the puddle walls of earthen embankments.

In the Appendix, No. 7, of the third Report of the Rivers Commission, in 1867,

Mr. Rawlinson recommended the use of concrete to protect the puddle in these words: "The cheapest material which can be safely used will be concrete, made of the best hydraulic lime, and laid thickly over the entire surface of the puddle trench. Concrete, or a thick bed of mortar, should in fact, protect puddle from contact with rock, gravel, clay, or earth at every point."

THE SANITARY IMPROVEMENT OF OUR PAVEMENTS AND FOOTWAYS.

NOTWITHSTANDING the improvements which have been made in our system of drainage, and in the construction of our streets and roadways by the use of asphalt and wood as a metalling, there still remains the unsanitary house area to deal with. In the metropolis, the open-grated area in our pavements is a source of mischief which it would be difficult to over-rate, and it is upon this subject we wish to say a few words. Nearly every street has its open areas for lighting the basements of the houses on each side; in many instances, as in the private thoroughfares, these are inclosed more by iron railings, but where shops exist the necessity of bringing the frontage to the pavement is obvious. In these cases the basement is often lighted by an area covered over by an open grating. It is almost superfluous to say the areas thus made constantly become the receptacles of road dust and dirt, and in course of a few weeks they are filled with refuse and decaying animal and vegetable matter, as every observer must have noticed. To clean the areas out it is necessary either to take off the outer grating and remove the refuse, or to open the basement-window and carry it through the house, the objection to either of which operations is plain enough. We have often wondered why the Metropolitan Board have not compelled the builders of houses in our streets to adopt some better mode of lighting than the open grating affords. Those who have closely observed the condition of some of the basements will have noticed that in a crowded thoroughfare like Fleet-street and the Strand the windows in the basements of the houses are incrustated with dust or mud all the year round, while the areas are receptacles for all kinds of refuse and decaying matter. What the health of those can be who live and work in these miserable basements, whose windows are beclouded with passing crowds, and bespattered with the mud of traffic, it is hard to say; but we think the public have also a right to complain of these foot-traps in our pavements. On public sanitary grounds, we think the subject of basement areas ought to be dealt with, and it is a pity the Metropolitan Board have no power to require, in the reconstruction of premises, some improved form of lighting and ventilation. There is a clause in the Metropolitan Management Act with regard to underground rooms as dwellings, requiring that any room more than 3ft. below the footway of the street, which has already been used as a dwelling, shall have "an area in front of the window to the extent of at least 5ft. long and 2ft. 6in. wide, and be open or covered only with open iron gratings," but this provision does not secure the object we are hinting at. We might, indeed, make out a stronger case of indictment than we have done. Sometimes these areas are 8 to 10ft. deep, and only 2ft. wide, but the basements are not necessarily used for habitation. In some of the streets leading from Covent-garden—Burleigh-street, for instance—the areas are choked up with vegetable and other rubbish, and the light is obscured, while in other instances the open grating becomes a dangerous foot-trap and a cess-pool. As the Board have power to compel

owners of property which projects beyond the general line of the street, to set back in case of pulling down, or of destruction by fire, &c., it is only reasonable to expect these areas will, in course of time, be made to conform to a general rule. But there is a remedy. The excellent prismatic lights manufactured by Messrs. Hayward, which admit light and afford ventilation to these areas, can be readily applied to all existing cases. The glass prisms not only augment the lighting power, but keep the area free from dust and rubbish. For dwellings in basements, the Board should require a structural alteration. The basement-wall of the front might be set back, or the area built as a recess within, instead of being made an external projection beneath the footway. In this case, if height allowed, the open grating might be placed within the frontage line; if not, light and air could be obtained by trimming back the ground-floor joists and introducing a vertical grating or light in the front below the ground-floor window. We have seen basements used as warehouses well lighted by prismatic pavement lights, but the advantage of vertical lights is obvious. It may be urged that the alteration of old areas would be difficult, and entail much expense. A lintel or arch would be required to be introduced at the proper level, after which an opening would be made between the arch and the pavement, and an iron grating or frame of lights inserted. The old window opening could be then stopped up, and instead of light being obtained through the grating, level with the pavement, a direct light might be got in the vertical opening cut out above the pavement, and the ceiling finished as a sloped bulkhead. If an area be required, it is very easy to support the front wall of house and set back the area into the room, though in this case space would be sacrificed. We have only indicated two easy methods of obviating the present basement-area and its numerous sanitary evils. Besides providing a very imperfect light, it becomes a kind of ash-pit, into which all kinds of refuse is swept; in time of heavy rains it is flooded, and there is seldom any drain to carry away water. The grating is dangerous, for the foot is apt to be caught in the openings; and as a sanitary imperfection, which has survived many important alterations, the subject demands attention.

PARKS AND SQUARES IN AND ROUND LONDON.

IF it be curious to note the difference in so infinite a number of ways between the London of 1593, as depicted for us by Pieter Van den Keere, and the London of the "Roman" era, it is certainly not the less so to compare the Metropolis of, say, but fifty years back, with that of to-day, as mapped out by the Post Office authorities. We are indeed in quite different towns, and but for the Tower of London on the banks of the Thames, and some few other well-known and not-to-be-forgotten landmarks, we should not know the very town we live in. And this is not in size alone, in length and breadth, but in *plan* and method of laying-out building-ground, and in the very designing of a new city. In the plan before us of 1593, by J. Norden, there is no indication whatever of any squares or open spaces, grass covered, and with trees, with the exception, here and there, of the open spaces between the blocks of houses and at the backs of them, till you get beyond the city walls and through one of the many "gates." Round the town and outside of its wall, we soon find ourselves in the green fields, with but here and there a house, or short length of houses, but, as we have said, in the town itself there are no green spots. This is curious to note, for the "squares" of London are of

quite modern growth, though we can hardly imagine this huge town nowadays without its "squares."

It is of the squares of London town, and of the parks and open spaces round and about it, that we would now say a few words, for the progress of house-building, all round and about London, north, south, east, and west, is so great, and is proceeding with such rapidity, that but for some little thought and attention in this direction, the open ways and "lungs" of mighty London will be, it is to be feared, altogether forgotten. We are here, too, it will be borne in mind, thinking not alone of the squares of London, but of the parks, now so fast getting to be but large squares in themselves, so to phrase it, for they are as house-surrounded as the smaller squares themselves. In Norden's plan, East Smithfield, and the space to the north of it, was indeed a *park*, as was also Spittle Feildes, with many other now entirely built-over spaces. In looking at this map of old London town, of some three centuries back, before this modern world of ours can be said in any sense to have existed, so different are all things, and bounded so definitely and closely by its wall, it would seem a pity that the plan adopted at Vienna was not thought of, where the "glacis" round the fortified walls of the inner and older city, wherein are the cathedral and older buildings, is not built over, but converted into a garden or grass-covered space, thus forming a park in the very midst of the Imperial city itself!

It is of course impossible to do anything of this sort nowadays, in our modern and huge city, for the very direction of the old city wall and city boundaries are not to be distinguished, except on a map, and only then with some painstaking and trouble. But there is one thing which, as we think, might yet be done, and which would, to a great extent, make up for the loss; and it is to take advantage of the size and number and position of our *present parks*, and to, if possible, *add* to their number, and thus to form a ring more or less complete, of green-covered and tree-covered ground, round huge London—day by day growing bigger and bigger. A somewhat close and careful looking at maps is needful here, and had this been done in the past we feel quite sure that much that is now to be regretted might and would have been avoided and very much would have been done that has been missed, and which is now impossible.

Leaving, then, Norden's plan of three centuries back, we may glance for a brief moment at the map of fifty years back, and before the railways were even thought of. In this map, by Edward Hogg, of Charing Cross, of 1836, the Regent's Park and Hyde Park are fairly out of town. They are surrounded by green fields and wide open spaces—Paddington, and Brompton, and Camden Town, and Pentonville, and Finsbury, to the north, were open fields. And the wide space from Hackney to Stepney on the east of London City were as vacant of buildings and all sign of house and city building as they well could be, and here it was that advantage might have been taken of the vacant spaces, to the north and east of London, and parks as large and healthy as Hyde Park and the Regent's Park, might well have been formed, and thus a circle or girdle of green and grass-covered spaces would have surrounded the north of London. And, in addition to these, if another and as much needed had been thought of for Stepney, between the Mile End-road and the river, London, on at least three sides of it, would have been bordered by those health-giving spaces of open grass-covered ground. A glance at the Post-office map of to-day will show, at a glance, how this fair chance of a good thing has been missed, and what it is that occupies these spaces.

We may then (and it was necessary, for the sake of some clearness, to note what has been) pass on to what is *now* possible; and the very first thing which must strike all who will glance at it is that the once "Sub-urban" Parks are now in the very midst of the huge city itself. The parks are house-surrounded. The Green Park is like a huge London square, and even Hyde Park, and with it Kensington Gardens, are as house-surrounded, and as much in London as any one of the large London squares. And it is right fortunate that this is so, accidental as it has been—for designing and contrivance have done, after all, but little here. And this it is that brings us, after missing much, to the main purport of this slight notice, and it is, to call some attention to the possibility of forming, by degrees, a yet larger circle round huge London of *open spaces*, and to, in some way or other, connect these together by wide and *tree-planted roads*. A glance at the post-office map will indicate what might well, at least, be hoped for, and certainly *begun*. The London of 1593 might, as we have said, been tree-begirt, like the old Vienna, and the London of half a century back have been park-surrounded, of which Hyde Park and the Regent's Park were the key-notes; but these chances being missed, we would suggest that the London of to-day might well be beautified, and the health of its ever-growing thousands added to, by a little timely thought and careful working-out. Without going into details, we would but venture to urge the retaining as open tree-covered and park ground the present market-gardens at Fulham—indeed, the whole of the space formed, or outlined, by the bend of the river here. Much of Hammersmith is yet unbuilt upon, while Wormwood Scrubs, due west of the town, and looking, like Hyde Park, as it did on the old maps, might well be spared, and the bricks and mortar kept out and away from it. Kilburn "Park," as it is named on the map, and the open space about it to the north might, at least in part, be reserved as open and grass and tree-covered spaces; parks, indeed, with wide and connecting tree-bordered roads connecting them. This, with Highgate and Hampstead to the north, takes us to Holloway, a town in itself, but in reality a part of London, and not to be distinguished from it or separated from it. A good park might yet be formed at Highbury, and thus a series or circle of open-spaces might be secured as "parks" north of huge London, so as to partly encircle it, and to form what we may fairly call the lungs of it. It is curious to note here that the Victoria-park, a thing of to-day, is now all but house and street surrounded, and will, in another year or two, be quite so. We must leave the south of London for another opportunity, simply urging on those who have influence and authority to take the whole subject of the London parks and squares into consideration. We might surely urge it on the attention of the House itself, while there yet exists so fair a chance, accidental though it be, of doing a something so useful and right serviceable to the London public—ever on the increase, and needing more and more, year by year, some new artificial and "contrived" compensation for that which their very "progress" must needs, in some way or other, deprive them of.

C. B. A.

THE FURNITURE TRADE CATALOGUE.*

WE have on our table a bulky volume, issued by the publishers of our contemporary, the *Furniture Gazette*, containing designs for every description of modern

* The Furniture Trade Catalogue, containing Designs, with Price-list. London: Wyman and Sons, Furniture Gazette Office.

furniture in the various styles in vogue, with a copious index and price-list. The object the publishers have in view is to provide a general illustrated catalogue of furniture for the use of the trade throughout the country, the designs illustrated being such as can be purchased at any wholesale house. The descriptive index and price-list which is prefixed will enable the retail dealer to fill up his own prices for articles, based upon the information furnished in a "wholesale trade price-list," which has been compiled by a practical and experienced man. These prices state the minimum and average figures, and will be, no doubt, found of great use by many in the trade. The last-named list is published in a separate form for convenience. Turning over the illustrations, which number 165, we meet with a selection of designs for every conceivable article of domestic furniture, beginning with simple matters like hat-rails, and other hall requisites, to drawing-room and bed-room articles. It is scarcely necessary for us to say every taste and style has been brought together, and that the designs aim more at supplying the trade with the prices of ordinary stock patterns of the various styles, than in setting the highest taste in these matters. As a catalogue of designs, the book, therefore, has a distinct value to the trade. With regard to some of the designs, we would rather not express an opinion, and we are sorry they should have been introduced; there are others of infinitely better taste, which suffer from their association. Thus we pass over the first three or four plates to meet with a hall-chair and tables of a superior kind. Many of the hall-chairs and umbrella-stands, as Nos. 16, 17, 31, are spoilt by a weak Gothicsque finish, not in keeping with present taste, though flashy. The chairs on plate 15 are better.

In looking at some of the designs for book-cases, we discover much of the Gothic spirit which prevailed some 20 years ago; while a few of more recent taste show a rather feeble knowledge of detail. We instance the way the pediments spring in designs Nos. 75 and 76. The best examples of sideboards are given in Nos. 95 and 101; the latter is quiet and broadly treated, and other moderate designs are given on plates 44, 45, and 47, which are as superior to those numbered 97, 99, 102, as the real is to the counterfeit. With respect to drawing-room furniture, a similar diversity of style and taste is to be met with. There are many intensely Gothic, others Louis Seize, some Japanese, and Queen Anne. Some of the Anglo-Japanese coffee-tables and the Chippendale shaped tables are neat, and the "occasional" tables and cabinets are numerous and varied enough to select from. The cabinets, Nos. 359, 354, and 360, are the best illustrated. The chimney-piece designs fall short, and are costly in finish, and the chimney-glasses and cornices are tawdry in some instances. The section devoted to bedroom furniture contains a few sensibly treated articles, and the catalogue in this, as in other departments, will be found comprehensive enough for the requirements of all.

PRACTICAL NOTES ON PLUMBING.— XIII.

By P. J. DAVIES, H.M.A.S.P., &c.

TRAPS (continued).

Ω-TRAPS MADE IN THREE PIECES.

THIS is a very old method of making Ω-traps: the bottom Q D F is cast, the dip M L soldered or burnt on, as also the outgo A Q J. A drawing of a trap weighing over 2cwt., lately taken out of an old house in Knightsbridge, illustrating this method, was published (Fig. 72) last week.

* All rights reserved

Ω-TRAP WITH LUGS FOR FIXING ABOVE FLOORS (Fig. 73).

Fig. 73 is a diagram of an Ω or half Ω-trap for fixing above floors, suitable for short or low balloon basins.

This trap may be made with cleansing cap and screw, and can be wiped down to the soil-

pipe at A, or on a straight outgo. This style of trap has been made in earthenware, but the difficulty has been to make the connection with the lead and outgo sound. This difficulty has been overcome by making the trap of lead instead of earthenware.

THE SEMI Ω-TRAP (Fig. 74.)

This is another trap for fixing above the floor line, and excellently well it answers its purpose. The bottom part, D H R, of this trap may be

bossed up on a block or otherwise, and the top or inlet soldered on, so that the lower part R B, forms the water lock. The foot E is also soldered on. Of course this trap can be fixed below the floor-line with the outgo soldered on in the usual way.

THE ECLIPSE TRAP (Figs. 75, 76).

This trap is a good and useful one, having a

F I C. 76.

dip N, with rounded bottom and top; an air-chamber B, which prevents wearing out (the great fault in the Ω-trap).

The Eclipse is cast in one piece of lead. Fig. 76 is the elevation of it, showing that the whole is rounded, which, in the estimation of many sanitary engineers, is a great advantage.

V-TRAPS (Fig. 77.)

This excellent trap is, in principle, part Ω and part Ω-siphon. Z is the cheek; T the

throat; J the top, which also goes down to form the throat, and up, then over to the top to V; the top or inlet-pipe is soldered on last.

The method of cutting out this cheek Z is as follows:—First strike the circle A, W, C, Fig. 78, draw the right line E K, cutting the top of

the circle; next draw the line E, square to the top line, and cutting the circle at B; then measure off the outgo R, with the distance from E, to the extreme periphery of the circle at C; now, with a straight-edge, draw the outgo line R, to cut the edge of the circle, as at C, then draw W D square to the top and the slanted line Y D, taking care to go low enough at the throat in order to have a good dip. Prepare this cheek and solder on the band, as at K G A E, Fig. 77, then the top, and dip in another piece, after which, solder on the inlet-pipe L M. Of course the throat part and up T W Z to R is soldered from the inside, and the part R E after. Messrs. Beard, Dent, and Hellyer make a cast trap somewhat similar to this last described.

Ω-TRAP.

This trap has stood its ground for at least 200 years, and there can be no doubt it had its origin from the dip pipe and bowl trap, then to the shape of the Ω-trap (to be explained shortly), then altered again to its present shape of a Ω.

But, in whatever way this trap first originated, there cannot be a doubt that it has lately got into sad disgrace with many who do not know its merits.

The Ω-trap has been made by many plumbers, who never thought it was wanted for anything more than the keeping back of stinks; they have made it to almost any size and shape, not troubling or caring whether it cleared itself or not.

I shall now show the best method of making it, so that it shall be what is generally known as self-cleansing; at the same time I shall keep within the bounds of that principle, which, I suppose, is universally known to be the beauty of the Ω-trap—viz., the clearing the soil from the inlet to the body of the trap, and its retaining the water-seal or lock; especially against the waving out caused by strong currents of air blowing down air-pipes or up soil-pipes.

Fig. 79 is an elevation of the \square -trap, having a cleansing cap and screw C soldered into the side or cheek; this latter being fixed here, is

more for sink work than for closets—in fact, the proper place for this cap and screw for closet-work is at I. In order to get at it, I have made \square -traps with the dip to screw in and out, but for sink-work it is best at the side or under the bottom, as at D, Fig. 80. This allows you to

take such things as tooth-brushes, &c., out of the dip, which cannot pass into the body of the trap.

Fig. 81 shows the outgo from the inside of the trap.

Fig. 82 shows my geometrical plan for striking out the cheek of a self-cleansing \square -trap.

The novelty of this is obtaining the point J, so that it will make the same angle in any sized trap—viz., the angle of 76° .

To strike this, take a piece of lead, having one straight edge, as from M to J, open the compasses to, say, $4\frac{1}{2}$ in., and scribe the circle D E H, cutting the line at E, then with the square M to K, also cutting the circle at K. Next and most important, place the point of your compasses at the intersecting point M, and with the other obtain the distance to the outside point of the circle, as at H, and as shown at O P arc; then, having obtained this exact distance, set it off along the line M E, as at J. This is the length of the top. Next from the point J draw the outgo line J H, and this will be the proper angle to allow the water to rush and sweep everything from the dip, along the bottom of the band, and out into the soil-pipe.

The next thing to be considered is the depth of this trap for self-cleansing purposes; this is governed by the size of the dip-pipe E (Fig. 80.) Suppose the dip-pipe to be 4 in., and the outgo-pipe the same, then the 4 in. outgo will take up 4 in. of the cheek, that is from the top down to the soil-pipe or outgo, as at K J, Fig. 83, so that this must be 4 in. Then you must have the dip longer than this to get the seal—which should never in any case be less than $1\frac{1}{2}$ in. to 1 in.—here in this case the bottom of the dip is $5\frac{1}{2}$ in. down the trap; then you should have 4 in., or the size of the dip-pipe, between the bottom of the band and the lower edge of the trap. This would be a 9 in. trap, but this is not

wanted, for $3\frac{1}{2}$ in. will be plenty for the space between the bottom of the dip and band, which, on account of being, so to speak, here contracted, the water will have a better scouring action on the bottom of the band, and the band being square or flat, will allow the soil, paper, &c., to go freely away; in fact, although you have only $3\frac{1}{2}$ in. between the band and dip, there is more water-way than through a 4 in. pipe. The next part to be considered is the width: this should

Rules.—Firstly: The depth should be twice the diameter of the dip-pipe, in addition to the necessary depth of the seal, which, in a former paragraph I have said should not be less than $1\frac{1}{2}$ in. to 1 in.

Secondly: The band or width of the trap must be just wide enough to admit the dip.

Thirdly: The outgo soil or waste-pipe must never be less in diameter than the dip-pipe.

Fourthly: That when soldering on the outgo

be, for a self-cleansing trap, only just wide enough to admit the dip, whether 1 in. or 6 in.; therefore, if you use a 4 in. dip-pipe, make the trap only wide enough to admit this pipe.

I have proved, beyond the shadow of a doubt, that if the \square -trap is made according to the following rules, it will never fail in doing its duty as a self-cleansing trap, and supersede all others at present invented.

or waste-pipe, the top of this pipe should be brought up to the top of the trap, as at K, Fig. 83, and be as smooth as possible, and without sharp edges.

Fifthly: Keep the dip-pipe close up to the heel of the trap, as shown at N, Fig. 83.

THE ACTION OF THE \square -TRAP.

Junior plumbers will do well to notice the details of the action of the \square -trap.

On lifting the handle W, Fig. 83, it brings up the lever H, with it the tumbler pin G, and the crank which works an axle having the loose valve F attached; the water then runs the full bore of the dip-pipe into the trap, striking against the band at D; it then flies off at a tangent to the point J, where it again strikes into the soil-pipe X, and down the pipe S; the air-pipe V, allows it to travel onward without dragging air through the trap; but should there be a strong wind blowing down this ventilating-pipe, or upwards from the sewer, &c., the air presses flatly, so to speak, on the surface of the water, and so keeps it steady. Having, I think and hope, made the working of the \square -trap clear to my readers, I must now refer them to Fig. 81, in which I shall endeavour to show the working of the ∞ -trap.

THE WORKING OF THE ∞ -TRAP.

So far as the closet apparatus is concerned, you have the same work as you had in the \square -trap. But the difference in the action of this and the \square -trap is that owing to the shape of the ∞ -trap; the wind, on blowing up the soil or down the ventilating-pipe, plays on the water at K, causing it to rock rapidly owing to the shape of the trap. This possibly goes on for ten or twelve hours, but, perhaps, only a few seconds. This rocking motion of the water causes it to ebb out through the outgo of the trap; thus, the so-called ∞ -trap ceases to be a trap, and becomes only a snare.

This, I venture to suggest, is a sufficient reason for all sanitary engineers to condemn the ∞ -trap, and, until they can find something to supersede it, use the \square , which I must repeat and have already proved publicly, is the best trap yet invented.

(To be continued.)

HOLLOWAY COLLEGE AND SANATORIUM, VIRGINIA WATER.

THE group of curative and educational institutions, between Egham and Virginia Water, now approaching completion, built and endowed at the sole cost of Mr. Thomas Holloway, furnished the subject for a "special" in *Tuesday's Daily News*, from which we make some extracts.

The Holloway Sanatorium is intended for the treatment of middle-class persons afflicted with mental disease, and no patient will be allowed to remain in it more than twelve months. It has been erected from the designs of Mr. W. H. Crossland, of red brick with stone dressings, in an Early phase of the English Renaissance style. A marked feature is a tall tower. The interior decorations have been designed and executed by various hands, under the direction of Mr. George Martin. With the exception of the grey marble top of the balustrade, the whole of the entrance-hall and staircase is painted and gilt over the stone. This was an after-thought. Cold grey columns and walls, even if enlivened by sculpture, would, it was considered, sit heavily on a mind diseased, and it was resolved to make the principal apartments one blaze of gold and colour. The hall is accordingly lavishly decorated with figures and designs arabesque and grotesque. If it be sound doctrine that surfaces of wood or stone should be gilt or painted, as the late Mr. William Burges, A.R.A., and some other authorities have maintained, the rich decorations of the Holloway Sanatorium are correct enough. The great lecture or recreation-hall is remarkable for a splendid gilded roof, and for a profusion of gilding and other decorative work on the walls and behind the platform. Portraits of distinguished persons, by Mr. Grandet and other artists, form part of the decoration scheme, and add interest to it. In the refectory also the apartments consist of a series of paintings in the style of Watteau, forming a frieze, above which are smaller groups in lunettes. In the smaller but still noble parlours and living-rooms the same idea of cherubines and long-strewnness is carried out. There is a model laundry in an entirely separate building, and red brick houses have been built for such of the staff of the establishment as are not obliged to sleep in the main buildings. In the original plan it was intended to use the main building as a place of assembly, but Mr. Holloway has now decided on building a distinct chapel, the designs for which have been prepared by Mr. Crossland.

Thousands of shrubs and young trees already fill the pleasure-grounds. The Sanatorium is planned to accommodate 400 people, and has cost about £300,000.

At a little distance from the Sanatorium, in the direction of Egham, is a still greater institution founded and endowed by Mr. Holloway, a college* for the higher education of women. Mount Lee has a frontage to the high road of about three-quarters of a mile, and contains 95 acres of freehold land. The college buildings, already far advanced, are set back from the road upon an elevated plateau, and surrounded by pleasure-grounds. The designs for the construction of this building were also made by Mr. Crossland, who is now superintending their execution. The style is that of the French Renaissance, in which sculpture entered largely into the design. Mr. Crossland has employed all the resources of his favourite style in so breaking up the masses of red brick and stone with pavilions, tourelles, and pediments as to obviate the monotony of a huge structure. In the pediments and whereon sculptured stone is required M. Façigna has designed and executed spirited groups. The college forms a double quadrangle 500ft. from east to west, and 350ft. from north to south. The main portions, which run from east to west on each side, consist of five floors, each 10ft. 6in. high, all of which (with the exception of the western portion of the lower floor, arranged as storerooms) are devoted to rooms for students, professors, and classrooms, connected by four spacious stone staircases placed equidistant, two in each wing. The building provides accommodation for 350 students, and each student will have two rooms, arranged as bed and sitting-rooms, each 13ft. 6in. by 10ft. 6in., and divided by corridors 10ft. wide and 500ft. long on each floor. The professors and heads of departments will have rooms in the central and corner pavilions, which are slightly larger in area. There are three classrooms also in the corner pavilions, each 28ft. by 16ft., on the ground-floor, together with a lecture theatre 42ft. square by 18ft. high. The three cross buildings running from north to south have been arranged as follows:—That on the west front comprises the chapel, 130ft. long by 30ft. wide and 30ft. high, and a recreation-hall 100ft. long by 30ft. wide and 30ft. high. These two rooms have an entrance-gateway between them, carried up through two floors, and leading into the upper or western quadrangle. This gateway is surmounted and surrounded by suites of rooms for chiefs of departments, arranged five on each floor, with porters' rooms, &c., all approached by stone staircases, the whole being crowned with a clock-tower rising to a height of 130ft. from the ground. The cross building between the quadrangles will contain on one side the dining-hall, 10ft. by 30ft. by 25ft. high, and on the other side the kitchen, 80ft. by 30ft. by 25ft. high, together with cooks' rooms, stores, and surgery, &c. The centre between dining-hall and kitchen is occupied by an octagonal tower, 100ft. high, containing, on the ground floor, a central hall 35ft. in diameter, approached from each quadrangle by flights of steps. The octagonal roof above the roof-line contains two series of low-service cisterns for supply to main buildings and hydrants. The floor under dining-hall is laid out as servants' rooms, and that under kitchen as stores, with large entrance-hall between. The cross building on the east front contains, on the lower floor, the tradesmen's driving gateway in centre, 48ft. by 17ft., on the left of which is a gymnasium and racket-court, each 50ft. by 30ft. by 16ft. high, the lavatories, &c., adjoining, with library on the floor over 100ft. by 30ft. by 30ft. high. On the right of the gateway will be two large music practice-rooms and twelve small piano-rooms, with museum and picture-gallery on floor over, 100ft. by 30ft. by 30ft. high. The driving gateway in centre of this block will have suites of five rooms on each floor over for heads of departments, reached by a spacious stone staircase and the whole surmounted by a bell tower 140ft. high. The three cross buildings are approached from the main buildings at each end as well as from the quadrangles, cloisters, and terraces in centre. The contract with Mr. John Thompson, of Peterborough, was signed on the 30th July, 1879, and the building has now been in course of erection for twelve months, and rapid pro-

* The College was illustrated in the *Building News* for Dec. 21, 1877, by double plate, giving plan and elevation.

gress is being made—the contractor having agreed to have the whole finished and delivered up in four years from that date for the sum of £257,000. This amount is exclusive of fittings, furniture, &c. Extensive plant and machinery are employed on and about the works, and about 800 men are constantly at work. The contractor brings all his materials on the ground by traction engines, two of which he has constantly at work between the railway station at Egham and the site, which are about a mile apart. The mouldings are all cut by machinery.

Mr. Holloway has, during the past season, made quite inadvertently a sensation in the picture market. A mysterious American was said to be buying up some of the best things offered by Christie, Manson, and Woods, and by private dealers. The "mysterious American" seems to have been no other than Mr. Holloway, whose idea is to make a "gallery of gems" for the "girl graduates" of the future. His purchases up to the present moment, all now to be seen at their temporary resting-place at the Sanatorium, are according to the following list with prices attached, from which it will be gathered that Landseer's famous "white bear picture" with the animals rending the Union Jack of a hapless Arctic Expedition, still rules high above even John Everett Millais:—

1. Trentside (Creswick)	£2,100	0	0
2. "Man proposes, God disposes" (Landseer)	6,615	0	0
3. Battle of Reveredo (Clarkson Stanfield)	3,465	0	0
4. Pic du Midi (Clarkson Stanfield)	2,677	10	0
5. Two Princes in the Tower (Millais)	3,900	0	0
6. Princess Elizabeth, daughter of Charles I., in prison at St. James's (Millais)	3,150	0	0
7. Landscape and Cows (Cooper) ..	273	0	0
8. Landscape and Sheep (Cooper) ..	546	0	0
9. Haweswater (Pyne)	273	0	0
10. Travellers in Storm (Copley Fielding)	3,150	0	0
11. Borrowdale (Collins)	2,625	0	0
12. Tomb in the Water (Matter)	2,362	10	0
13. Verona (Holland)	913	10	0
14. Old Cronies	550	0	0
	£32,690	10	0

THE NEW BUILDINGS OF THE BIRMINGHAM AND MIDLAND INSTITUTE.

THE new buildings of the Midland Institute, by the side of the town-hall at Birmingham, are to be opened on the 20th October, having been erected at a cost of between £25,000 and £30,000. The new lecture-theatre is about 65ft. wide, 100ft. long, and rises to a clear height of about 40ft. The entrance is in Paradise-street, and forms a hall 55ft. in length and 22ft. in width. It will be connected with wide staircases and cloakrooms, and with the rooms on the first floor, devoted to the uses of the general department. The theatre is roofed-in with wrought-iron girders, carried on a series of rectangular piers on the two sides and one end of the building. The girders are of great depth, having to carry a span of about seventy feet, and the ceiling constructed between them is deeply coffered, and is now being painted and decorated. The interior walls of the theatre are of brick and stone, there being no plaster. The spaces between the piers that are not filled with windows are panelled to the same design as the windows, and the panels are filled with arrangements of encaustic tiles, specially designed with regard to the colour of the whole of the interior. The windows are filled with stained glass. The floor of the theatre will have a slight slope towards the proscenium, and will afford space for the accommodation of 1,000 persons. The stage will be fitted up for the various uses to which it will be applied, and is to be connected with the rest of the building by a lift, by means of which any appliance may be brought from the general apparatus room, which is on the upper story, without risk or difficulty. Above the stage a room has been formed, which will be used partly as a store-room for diagrams, and also for electrical apparatus. The alterations made expressly for the members of the general department include, on the upper floor, the provision of a news-room, 27ft. wide and 50ft. long; and a writing-room, which is 17ft. wide and 27ft. long. In contiguity are spacious lavatories. On the same floor, but entered from a separate doorway, is a reading-room, about 27ft. by 30ft., for ladies. The In-

dustrial department has been rearranged. The old classrooms have been altered, and new classrooms added. Above the lecture-theatre two sets of rooms have been provided, part of which are devoted to the Institute, and part to the accommodation of the School of Art. The Science department has been remodelled. The laboratory has been more than doubled in area, and two special lecture-rooms have been added. There has also been a large room provided for the scientific apparatus, and a special room for the meteorological instruments and the electrical clocks. The Archaeological section will have a room of its own, in which it can keep its various collections, and where the members will be able to assemble. The School of Art, on its reopening, will be in possession of a set of rooms far superior in all respects to any that it has ever occupied. The rooms are specially lighted from the north, and are lofty and well ventilated. Only a portion of the reconstruction which has been going on for the last three or four years is visible from the street. That part which is now to be seen in Paradise-street is the building containing the cloak rooms, offices for the staff, newsrooms and writing-room belonging to the general department, and a portion of the rooms of the School of Art. The building is of stone, and is in the Gothic style. The principal features of the front are the entrance doorway, to the right of which is a series of windows lighting the ground-floor. The windows are deeply moulded, and all the jambs are square-headed, with corbelled angles. The first floor is lighted by four large groups of windows, each of two lights, but surmounted by a single arch, the foot of which is carved with a design of flowers. In each of the window heads there is a traceried panel, which has been filled with mosaic work, executed by Salviati. The windows are divided by deeply-recessed niches, which are ornamented by gabled and crocketed canopies, running partly into the story above them. It is hoped that at some future time these niches will each hold a statue. The wall space between the niches and the tops of the windows is covered with carved diaperwork. The third story is comparatively plainly treated. The fourth story consists of four large and bold gables, rising a considerable height, each containing a four-light window, with a large head filled with tracery. The spandrels of these windows are carved in a free and bold manner, with panels filled with beautiful floral and foliage designs, including representations of the lily and the vine. The gables are completed with crockets and finials. The parapet is pierced with open tracery, and above all these rises a lofty roof, which covers the upper story used by the School of Art, and terminates in a steep ridge, with two ornamental wrought-iron finials at each end.

The work has been carried out from the plans and designs of Messrs. Martin and Chamberlain. The contractors are Messrs. Horsley, of Newton-street. The carving has been executed by Mr. Barfield, of Leicester, and the wall-tiling is being specially done by Messrs. Minton. The ornamental and other glazing is the work of Mr. Hawkes, of Bromsgrove-street, and the structural ironwork has been supplied by the Horsley Company.

FLORENTINE TAPESTRIES.

IN a letter to the *Times*, "Ouida" calls attention to the cruel fate awaiting the valuable collection of arazzi in the city of Florence. "Many have hung for years in the famous corridor running from the Pitti to the Uffizi; and here they were safe, although the light was execrable, and the dust from the reddened stone floor injurious to them; while the extreme narrowness of the passage prevented full enjoyment of their proportions and perspective. But besides these in this corridor, a very large number (I believe *circa* 600) of yet finer tapestries have been all these years thrown down on ground-floors and underground floors of the Pitti, left on the bricks like so much rubbish, a prey to every insect that chooses to burrow in them. Other tapestries, all of extreme value, historical and artistic, are doubled up and stowed away in chests. When the custodians are asked if the tapestries do not injure in this treatment, they answer merrily '*S'certo!*' as if it were the best joke in the world. Of course, they are injured, but what does it matter? Nobody cares. Now, since the new commission has been appointed to rearrange the galleries of Florence, matters are still

worse. All the tapestries that were safe in the corridor have been taken down and added to the quantities already lying on the floors of the Pitti. As a consolation we are assured that they shall be 'put away in chests.'

"The interest, the preciousness, the beauty of these doomed arazzi, and of the many in the darkness of the Pitti that are slowly rotting away, as if they were bales of damaged calico, cannot be disputed by any educated person, and are undeniably so great that any other nation would have a gallery or museum dedicated to their preservation with scrupulous love and care. The corridor was far from what one could wish, but at least they had walls there on which to hang, and air to keep them from destruction; and further on there is a much wider and lighter corridor now occupied by inferior engravings, in which the tapestries now lost to the public on the floor of the Pitti might be suspended and well seen. It is frightful to know that these arazzi, so incomparable, so full of interest and of instruction for the student and the artist, should be thus thrust out of sight, and doomed no doubt, eventually, to 'disappear,' as so much that is precious has disappeared from the galleries, palaces, and libraries of Italy, without the offenders ever being discovered, or, at least called to account. There is a promise, indeed, in the air, of making either San Marco, or the old Monastery on Monte Oliveto (now a barrack) into a gallery of the arts. I would fain, through your columns, summon all who care for the past and its matchless labours to bestir themselves, and insist loudly that some fitting resting-place be found, and that at once, for the tapestries of Florence. When I wrote to you some two years ago concerning the works upon the Tiber, I received frantic abuse from the Italian and a great part of the English Press; but when I passed this last season in Rome, I found that everyone had come to my opinion as to the madness and futility of those devastations. The very engineers themselves stand aghast before the ruin they have wrought and the breeding-pits of fever they have dug, where a little while since the grand trees of the Farnesina cast their historic shade.

"The arazzi of Florence are certainly of less grave import than the sacrifice of Rome to engineers' crochets and contractors' greed; yet it is one which must profoundly concern all who care for art and history. Some years past one of the greatest capitalists of Europe offered to buy for an enormous sum all these tapestries. Shameful as it would have been for Italy to 'barter her children' by acceptance of such an offer, in the interests of the arazzi themselves it had been better accepted, for the great financier would not have thrown them on brick floors, nor would he have shut them up in chests."

NEW DOCKS AT LIVERPOOL.

THE Alexandra Docks at Bootle, $3\frac{1}{2}$ miles north of Liverpool, which have just been completed from the designs of Mr. G. F. Lyster, the engineer to the Mersey Docks and Harbour Board, were formally opened by the Prince and Princess of Wales on Thursday in last week. The new works add 110 acres of water-space and more than six miles and a half of quay berthing to the accommodation for the shipping trade of Liverpool; and the entrances have their sills laid at a level which gives a depth of 23ft. 7in. on an average neap tide and of 30ft. 10in. on an average spring tide. The entrance to the new dock system is through the Canada Basin, in which the tide ebbs and flows, and which forms a sort of vestibule to the most northern docks which existed before the latest additions. This basin at the mouth of the river has been considerably enlarged and deepened to meet the new requirements, and the width of its entrance from the river has been increased from 250ft. to 400ft. On each side of this entrance are being constructed piled timber jetties or piers projecting into the river. That on the north side is completed, and is a remarkable work. The river-wall here curves outward somewhat sharply, and terminates in a massive, rounded pierhead of granite. The jetty projects backward from this about 40ft., and ends in another pierhead of concrete, whence another arm extends to the river-wall. The main jetty is supported by greenheart posts let into a solid base of granite

to the depth of 17ft. On the north end of the horn pier is a small look-out tower, and beside it is an ironwork standard 80ft. high for the electric light. On the north side of the Canada Basin are two passages by which the newly-constructed docks are reached. The first is the Langton Dock, with a water area of 18 acres and a quay or berthing-space of 4,000ft. in length. Opening from the eastern side of this dock are two graving-docks (each 951ft. long), which may be subdivided into four docks. On the quay between these graving-docks buildings are erected, which contain powerful engines and machinery for pumping the graving-docks. Here, also, are powerful engines which supply the motive power of the hydraulic machinery for opening and closing the dock-gates, bridges, sluices, working cranes, and other mechanism throughout the new system. Over this great engine-house are a number of dwellings built on the "flat" system for the foreman and engine-men. On the quay is also constructed a clock-tower 120ft. high to inclose the accumulator. The group of building is in a free Gothic style of architecture. On the east side of the Langton Dock (and north of the graving-docks) is also a branch dock, with three acres of water area and 2,013 lineal feet of berthing-space. A hydraulic crane to lift 100 tons is being constructed on the south quay of this branch dock for moving heavy boilers and machinery. On the north side of the Langton Dock are two passages which lead to the Alexandra Dock, which is specially constructed for steamers of vast size. This Alexandra Dock is 1,600ft. long from north to south, and opening on its eastern side are three branch docks which extend inshore almost to Regent-road. These branch docks vary in length from 1,100ft. to 1,338ft., and with the Alexandra Dock itself have a water area of 44½ acres, and provide 11,811 lineal feet of quay berthing-space for ships. The dock walls are mostly built of cement concrete faced with red sandstone of the district, and with a coping of granite, while the entrance walls are faced with granite. The steps and slips of the graving-docks are constructed of granite, but in other respects these docks are built of concrete. All the dock gates are made of greenheart timber, which Mr. Lyster considers the most durable wood for this sort of work. The berthing-quays of the new docks are provided with lock-up sheds, 80ft. to 95ft. wide, for the protection of cargo in transit, and these sheds directly communicate by road with the city, and by rail with the stations of the several railway companies who have termini in Liverpool. In the west gable of No. 1 Branch of the Alexandra Dock has been inserted a fine piece of stone carving lately discovered in the interior of the King's tobacco-warehouses, at the south end of the docks. It represents the arms of Great Britain before they included the shamrock, and is supposed to have been in the old tobacco-warehouses erected in the reign of George III. On the east side of the main entrances by which vessels enter this new group of docks a solid block of buildings—a free adaptation of the Domestic Gothic in style—is being erected to provide residences for officers. North of the Alexandra Dock is being constructed another new dock, with 16 acres of water area and 4,000ft. of quay berths. The river-wall extends to the southern limit of the estate, and in time the promenade, 21ft. wide, already open for a considerable distance, will extend across Bootle to Seaforth. The whole of the docks northward from the Prince's Dock are completely inclosed either with a wall 11ft. high or with loftier buildings, thus protecting the ships and quays from depredations.

TESTING FULL-SIZED BRIDGE COLUMNS.

A SERIES of experiments has lately been made to determine the strength of wrought-iron columns manufactured by the Phoenix (Pa.) Iron Company, and known as Phoenix columns. These tests were made in the Government machine at U. S. Arsenal, Watertown, Mass., and upon full sized columns of from 12 to 18in. sectional area of metal and from 5in. to 25ft. in length. Twenty-two samples were submitted to ultimate compression strain. The elastic limit and deflection and the total compression are given in a table published by the American Society of Civil Engineers,

from which it appears that they are stronger than theoretical formulæ heretofore used have made them; for example, a column 28ft. long, 8in. diameter, or 49 diameters in length, having a sectional area of 12in., was compressed 0.19 of an inch under a load of 300,000 pounds, and gave way under 421,000 pounds, or 35,159 pounds per square inch of section. Another sample 25ft. long, of 18.3in. sectional area, was compressed 0.115in. under 300,000, and was crushed at a load of 659,000 pounds, or 36,010 pounds per square inch of section. The shortest sample, about one diameter in length, 11.9 square inches sectional area, showed only 0.008 of an inch compression at a load of 300,000 pounds, and was crushed at 680,000 pounds, or 57,130 pounds per square inch. The loads sustained at various states of deflection were also observed and tabulated by Mr. James E. Howard. It is a new and important departure from old methods to test full-sized, complete members of engineering structures, in lieu of small samples of the material proposed for their construction—the only available way before this enormous machine was built by the United States Government.

WEST WINDOW FOR ZANZIBAR CATHEDRAL.

WE have been invited to inspect a west window for this cathedral to be inserted in connection with the Universities Mission to Central Africa. The design has been made by Mr. Murray, of the firm of S. Belham and Co., 155, Buckingham Palace-road, S.W., who have executed the work under the directions of Mr. C. F. Hayward, architect. The window is circular, its diameter being 15ft., and the design is of Geometrical character, with circular piercings. The principal openings occur in four groups of circular lights arranged round a centre with pierced lights between of triangular shape. The design is simple and conventionally treated. From a central sun, radial branches diverge in four directions, and the main circles have been arranged as terminals, in each of which a folial design with flowers is introduced. The foliage is freely drawn, and is coloured green in varied tints on a rich ruby ground. The borders to the medallions are largely relieved by blue, and the triangular perforations are filled with colours which do not distract the eye or lead it away from the leading design. The whole of the window has been executed in richly coloured antique glass. It may be of interest to say that the glass is inserted in tracery constructed of concrete, in which red coral, abundant in the locality, is introduced.

WHITBY ABBEY.*

ON the 5th inst., a section of the members of the British Association paid a visit to Whitby, where they inspected the abbey and the church, under the guidance of Mr. Charles Noel Armfield. At the former building, Mr. Armfield delivered an address, in which he said that the building of an abbey on that site was begun about the year 658. That abbey was commenced and completed by Lady Hilda. Of that abbey, however, we have no remains, and the magnificent building of which they now saw the ruins was the work of a later period. The abbey which Lady Hilda built was not, as many supposed, built of stone, but of wood and thatch. The original abbey of St. Hilda, being built of such slight material, could not be expected to last long, and, consequently, it was rebuilt, and here was placed the first stone of which we have any record, and upon which was erected the building which we see this day. When the first stone of this abbey was laid we have no record; but it is supposed that this abbey gave the name, or suggested the name, of Whitby, because of the whiteness of the stone. One historian says that it could not be the bay itself which suggested the name, for the sea and the cliffs south of the harbour are black, and the more appropriate name apparently would have been Black Bay. The building of this abbey, the ruins of which

they were now standing among, was commenced about the year 1220, and it is worthy of remark that it was built almost entirely in one style. It was not an abbey that had been built at different ages, and it is probable that it was completed in the year 1300, after which, later work was inserted. In the general plan of the edifice there was one remarkable point, and that was, that whereas the axis of the nave of the church points due east, the axis of the chancel points five degrees more to the north, instead of being in a straight line. Mr. Armfield related, in a simple and entertaining way, the two traditions which are supposed to explain the cause of this. Continuing, Mr. Armfield said that the architecture of the church contained the purest type of Early English, and the purest type of Gothic, that there are in the whole world, and he pointed out where these in particular occurred. Mr. Armfield made the remarkable statement that the church had never been vaulted, notwithstanding some historians and antiquarians had written as though such had been the case. He gave his reasons for forming such an opinion, amounting to conviction in him, and pointed out the peculiarities of the tops of the walls, which, he said, showed that it was impossible that the edifice could have been vaulted. While the building had so many choice pieces of architecture in it, it was one of the worst-constructed in the world. He pointed out where the magnificent tower was erected in the north transept, and stated that it fell on the 26th of June, 1830, on the spot where they were now standing. He pointed out an inscription, in Latin, on one of the pillars, which, in effect, was "I, John of Brunton, built this altar to the glory of the most blessed Virgin Mary." Dr. Young, in his History of Whitby, says that this is all nonsense. With all due respect to Mr. Young, he, Mr. Armfield, begged to hold a different opinion, as he was certain that the transept was dedicated to the Virgin Mary. In the church of Rome they always made the Lady-chapel the most blessed place, and it was no wonder that this inscription, seeing that it is on the most beautiful part of the building, was put there as a dedication to the Virgin Mary. Standing there as they now stood, in the sight of that magnificent pile, they saw, taking all in all, the most lovely specimen of Gothic architecture in the whole world—there was nothing like it in France, Germany, or Spain. Whithy had reason to be proud of its specimen of Gothic art: people might come to Whitby to study that, as they went to Athens to study Greek art. Mr. T. Hayter Lewis, late of University College, London, expressed his entire concurrence with Mr. Armfield's address, having been over the edifice and carefully examined it.

EXAMPLES OF DOMESTIC ARCHITECTURE.*

PART I. of a recently published work under this heading illustrates a series of executed designs by Mr. Thomas Hartas, architect, of King's Chambers, Manchester, in which the author claims to have applied a new system of geometric proportion. The part before us contains four photo-lithographic illustrations of detached houses recently executed by the author, with descriptions, though there is little in the designs to suggest that "numerical principles of geometric proportion derived from the laws of music" had been consulted. The author, in his preface, says: "Each of the houses has been built at a price at which it would be absolutely impossible to carry out any equally effective design, in which these new principles of form harmony are not applied." What the system is to which Mr. Hartas alludes it is difficult to say, as there have been so many theories based on numerical ratios. We are quite willing to admit that the harmonies of sound, colour, and form are closely analogous, and if Mr. Hartas has discovered simple rules for the application of these ratios to every-day architecture, he has achieved a success which other painstaking engineers in the same field have failed to accomplish. The author, at least, claims to have reduced theory to practice, and he mentions the works of the late Mr. D. R. Kay, of Edinburgh, who is well and deservedly known for his scientific investigations in to har-

monic ratios. By a few simple geometrical rules, the author says "it is possible to transform a monotonous street tenement into a pleasing architectural composition; which, while it cannot claim to be a specimen of high art, is yet devoid of all that offends the eye." The application of these principles, the author has further proved, greatly "increases the commercial value of the houses which he has designed."

Having thus, in the author's own words, explained the object of the work, let us take the designs, as indicating in a practical form the value of the theory. The first is a design for a cottage erected near the Broadway, Salford, for Mr. T. Bebbington, registrar. In the plans there is certainly very little to lead us to suppose that the laws of harmony had been brought to bear; there is nothing in the arrangement which appears to have been arrived at by geometrical means. The elevation shows a corner window and oriel turret at one corner and a gable at the other. The style is a kind of Gothic, and the house is built of dark red stock bricks relieved by stone dressings with roof of Westmoreland green slates. The contract, taken by Messrs. Hibbert, was for the sum of £713, certainly a moderate price. With respect to the design, we cannot say that the result is such as to prepossess us in favour of Mr. Hartas's system; the proportions and details are not perfect, and we might even be disposed to think that the empirical formula for design usually adopted by architects can be made to yield equal if not more pleasing elevations. The house in Melton-road is decidedly open to criticism—the centre bay partly placed beyond the divisional wall,—to say nothing of the upper arrangements,—is, to say the least, awkward; and the bay externally, square below, octagonal, and square again at the top, is rather too acrobatic to be pronounced harmonious. Large detached villas at Mansfield, and a farmhouse, Stretton, Derbyshire, are other designs; the last is simple and unpretending, and is more satisfactory to our minds than all the others. The ingenious theory through which the author has introduced his designs have induced us to examine them more carefully than we otherwise should have been disposed to do. To propound a system of design is very well; but to profess to have rules which are unknown to the profession savours too much of charlatanism, even though the author's motives are the highest.

THE BEER QUARRIES.

THESE ancient West Country quarries were visited, by invitation of the directors, by a large number of the principal architects and builders of Devonshire last Monday. The works have recently come into the hands of a new company, and it is hoped that these fine quarries—which in mediaeval times were so extensively worked, but which, for want of energy and available capital, have for many years been comparatively idle—may once again come to the fore. Beer is a romantic fishing-village, near Under Seaton, upon the south-eastern coast of Devon, and the quarries are of immense, yea, of unlimited extent. The stone itself consists of carbonate of lime, silica—25 to 30 per cent.—and lime; it is finer in texture than Bath-stone, and much whiter than Caen, and is delivered in London at 1s. 4d. a cubic foot. The strata of stone cover a space of 3 by 2½ miles, of which, during the last 1,000 years, not more than three quarters of a mile square have been opened out. The party left Exeter Station in saloon carriages, amongst them being Messrs. Ashworth, Rowell, Keats, Pinn, Crocker, Peters, Bridgman, Webb, Medley, Fulford, Jerman, Wills, Packham, Boulnois, and other architects; Messrs. Harry Hems, W. R. Cumming, H. Phillips, and so many gentlemen interested in the stone trade. The quarries, which lie in combes amidst wild scenery, consist of two distinct portions, one part being worked open, and the other tunnelled. The blocks of stone raised are similar in size to those obtained in the well-known Bath quarries. The present underground workings cover 13 acres, and were illuminated for the occasion. The effect of many hundreds of candles, lighting with uncertain and flickering rays the vaulted roofs of the tortuous, winding caverns was weirdlike and curiously fascinating. Particularly interesting were the old Norman workings. These have not been touched since the days when the Cathedral at Exeter was

* This abbey has been illustrated in the BUILDING NEWS by the following drawings:—Perspective of interior of north transept, by Mr. E. H. Spence, Oct. 29, 1881; sections of mouldings, by the late Mr. Edmund Sharpe, Aug. 25, 1871; exterior of north transept, by Mr. J. Langdon, June 25, 1875; and measured elevations and sections by Mr. A. P. Gunston, July 2, 1880.

* Examples of Domestic Architecture. By THOMAS HARTAS, architect, Manchester. Price 1s. Published by the author.

built, of which time old manuscripts still exist, showing that the stone came from these self-same quarries. Further on are the portions worked in the 14th and 15th centuries. In those days, Beer stone was used universally throughout nearly all the ecclesiastical and secular buildings of Devon. After carefully inspecting these quarries, the party drove to Beer Church, a handsome building, erected recently from Messrs. Hayward and Son's designs, at the expense of the Hon. Mark Roile. This edifice is built largely of Beer stone, and was much admired; the excellent masonry and the carving (by Mr. Harry Hems) being a fair sample of the capabilities of the material. Adjourning to the Clarence Hotel at Seaton, the visitors sat down to an excellent repast, and in responding afterwards, Mr. Edward Ashworth (Exeter), Mr. J. W. Rowell (Newton Abbot), and Mr. J. Keats (Plymouth), testified to the satisfaction they had derived, as architects, from a long use of Beer stone in their buildings, and expressed their intention to continue to specify a material which they found, in its working and lasting powers, to be at once economical and satisfactory.

A NEW CHINESE LIQUID INK.

IT has long been the aim of artists' colourmen to supply a really good Indian ink in a liquid form, free from sediment and film, and so meet an established want experienced by most draughtsmen. In this way several preparations of lampblack and Indian or Chinese inks have been produced, each in turn claiming to have solved the problem. The continued general use of the old-fashioned stick ink, notwithstanding the waste of time which its rubbing down involves, may, however, be taken as a very fair evidence that the desideratum thus described has not hitherto been manufactured. The necessity of rendering the ink indelible seems to have been the chief difficulty in the way of such a production, coupled with the equally desirable quality of absolute blackness as well as an absence of sediment or film. Within the last few days, Messrs. Wolff and Son, the well known pencil manufacturers, have sent us some specimens of the new Chinese liquid ink, of which they are the makers. We have subjected this ink to several tests, with most satisfactory results. It seems to answer all the requirements above-mentioned, and it has certainly all the sheen and also smell of the better kinds of stick ink. We have likewise tested it from a small quantity exposed to the air for twenty-four hours, and in this rather severe ordeal it has shown its indelible qualities. Ordinary Indian ink, as is well known, will wash up if used from a palette in which it was mixed and in which it has stood since the day before. Wolff's ink has thus a decided advantage. It flows freely from the pen, and allows of the finest lines. It dries quickly and is capable of being graduated to any degree of blackness, from a shade of delicate grey as may be required, by diluting it more or less with water. Washes of colour do not disturb it, and even burnt sienna does not cause it to run. The makers say that it will keep good for any length of time. For outdoor sketching as well as office work it seems equally suited, and thus may be recommended to our readers for trial.

OUR COMMONPLACE COLUMN.

PANEL.

FR. *panneau*, through Latin *pannus*, a piece of cloth.—In Late Gothic, the "linen pattern" was a favourite design; it is also seen in Elizabethan woodwork such as dados. Traceried panels and shields are also common in Gothic of the Perpendicular period. Early English panels are ornamented with cusped circles, quatrefoils, circles, which become more elaborate and subarcuated towards the Later style. Bosses of foliage, portcullis, lilies, Tudor roses, &c., were common enrichments in the 16th century.

PANTAGRAPH.

An instrument for copying plans. The copy can be made to any scale. The instrument consists of four rods jointed together. When one point is fixed, the other points can be made to describe similar figures, the outer point describing to a larger scale than the centre one. The

points are determined by the ratio of proportion the scale of the copy bears to that of the original. One point is weighted and made the centre of motion, and the central point holds a pencil, while the outer point is used as the tracer of the original drawing. The last-named tracer is made to travel over the outline of the original, and the pencil-point makes a copy to the required scale. By exchanging the positions of the pencil and tracer, a larger or smaller copy can be made. The instrument depends upon the principle that the two triangles which have for their angular points the fulcrum, the pencil-point, and a joint, and the fulcrum, tracer-point, and a joint, must always preserve their similarity. A recent French application of the pantagraph has been made, by which sculptures can be copied, enlarged, or reduced to any proportion, in which case the instrument is placed in vertical planes.

PAPIER MACHE.

PULPED and moulded paper is said to have been in use for more than a century in Europe. In India, China, and Japan papier maché has been long known, and is employed for trays and snuff-boxes. Its first application has been stated to have been the manufacture of snuff-boxes by a German in 1710. As a material for architectural and decorative purposes, it has been extensively employed. The ceilings of several Elizabethan mansions, and those of Chesterfield House, are made of it, and when stucco-workers raised the price of their labour some time ago, papier maché took the place of stucco in house-ornamentation. Carton-pierre is a similar material, and is made by combining stucco and paper. The high polish given to papier maché articles is obtained by coating them with successive layers of asphaltic varnish, which is submitted to heat in ovens till the volatile part is dissipated. It can then be polished. Inlaid mother-of-pearl is produced by applying thin flakes of the shell on the varnish, and afterwards ground down and polished.

CHIPS.

The permanent bronze bas-reliefs for the Temple-bar Obstruction have been modelled by Mr. C. H. Mabey, and cast by the ironfounders, and in the course of three or four weeks the London rough will have the opportunity of breaking pieces from the real bronze panels, instead of impelling his liberty by practice upon the plaster models.

During the restoration of Matherne Church, near Chepstow, a stone coffin has been discovered, which is supposed to be the one in which was buried Theodoric, or Tewdric, King of Glamorgan, afterwards hermit and martyr, who was mortally wounded in battle, A.D. 560. The coffin has been found lying lengthways in the chancel, and immediately under a tablet on which was written a long descriptive epitaph by Godwin, Bishop of Llandaff, 1601-17, who tells us that he opened the coffin and saw the body of Theodoric. The coffin is 5ft. 5in. long inside, 6ft. 9in. outside, 16in. to 20in. broad interior, and 6 1/2 in. deep. The stone is native and in good preservation. In the coffin there were found human bones and portions of skull in fair preservation. Near to the foot of the coffin there was found also an urn, in which it is supposed that the heart and bowels of Bishop Miles Salley were interred, as the said bishop directed that these portions should be so buried.

The surveyor of Bournemouth, Mr. W. H. Andrews, has been reprimanded by the town commissioners for having violated the terms of a sewage-outfall contract by permitting the substitution of thinner pipes than those contracted for. His salary was also reduced from £300 to £250 a year. It was at first proposed to dismiss the surveyor.

The Docks Company of Falmouth, at their meeting last week, resolved to expend £11,000, subject to the sanction of the Public Works Loan Commissioners being obtained, in deepening the large graving-docks and the entrances, and in providing a 30-ton power crane, as recommended by their engineer, Mr. J. B. Tilly.

The *City Press* states that the destruction has already begun of one of the most picturesque portions of Lincoln's Inn. The chambers now being cleared away from the west end of the chapel were built about 250 years ago, and presented some fine specimens of old Jacobean brickwork. The mural tablets on the chapel staircase—including one in memory of Spencer Perceval, who, at the time of his death by the hand of Bellingham (May 11, 1812), was treasurer of Lincoln's Inn—are now removed into the chapel.

ARCHITECTURAL & ARCHEOLOGICAL SOCIETIES.

WARWICKSHIRE ARCHEOLOGICAL SOCIETY.—This society visited Napton on Wednesday week, after having inspected the church of St. James, Southam, on their way. The members were met at the church of St. Lawrence by the vicar, the Rev. J. Baldwyn Pugh. The exterior of the north wall of the chancel was pronounced to be of the Early Norman period. The principal window of the north aisle—of the Early English style—was then examined. The next window on the same side was considered to be as recent as the 17th century, but in its surroundings there were traces pointing to the latter part of the 13th century. The porch was of great age, but it was regretted that the old arches at the sides had been filled. Portions of the oak carving of the former rood-screen (dating from about 1450) are inserted in the modern pulpit. In the wall above the pulpit on the south side were found traces of the doorway of the vanished rood-loft. Beneath this is a small hagioscope looking obliquely into the chancel. The south aisle was probably the chapel for which a licence was found to have been granted by the Bishop in the 16 Richard II. unto one John Adams, of Napton, that he might have divine service celebrated therein. In the north aisle, a mortuary chapel of the De Naptons are two vaults, one of which was accidentally broken into some years ago, and a body encased in leather was found and re-interred. Mr. Matthew Helbecke Bloxam, of Rugby, said it was the custom at one period, about the 12th century, to encase a corpse in bull's hide. The party also inspected the earthworks in the vicinity of the church, supposed to have been a stronghold of the ancient tribe of the Dobuni. In the afternoon the churches of Upper and Lower Shuckburgh were visited.

CHIPS.

A college for 260 boys, to be known as Kingsley College, is in course of erection at Westward Ho, and will be opened in January next.

The foundation-stones of new local-board offices, mortuary, and other buildings were laid with public ceremony yesterday (Thursday) at Hornsey, N.

The exterior of the ancient chapel of the Castle of Vincennes having been found to be in a much decayed, if not dangerous, condition, it has been resolved to remove the *clochetons* of that edifice, transport them to Paris, and re-erect them in the garden of the Musée de Cluny.

The negotiations for the transfer of the Royal Institution, Manchester, to the corporation of that city have been concluded on the eve of the opening of the annual autumn exhibition of pictures. The proposal of the proprietors was to hand over their land and building in Mosley-street, with its pictures and statuary, to the municipal body, free of all cost but the payment of chief rent (about £100 a year), and a guaranteed endowment from the city rates of £2,000 a year for the purchase of pictures to enrich the permanent collection. This public-spirited offer has been agreed to, on the understanding that the endowment should be limited to the next 20 years, anything contributed after that to depend upon the public opinion of the time. The art gallery will be open free to the public on such days of the week as the committee shall determine. The building thus acquired for the public was erected from Sir Charles Barry's designs; the front is of stone, and has a handsome Greek portico, but suffers from half a century's exposure to the soot and sulphur from Manchester smoke.

The memorial-stones of a new Wesleyan chapel were laid at Treeton on the 8th inst. The style is "semi-Gothic," according to a Sheffield newspaper; the cost will be £700, and seats will be provided for 150 worshippers. Mr. F. J. Jones, of Treeton, is the honorary architect, and Mr. Earnshaw, of the same village, is the sole contractor.

The corporation of Birkenhead have resolved to erect a cast-iron covered tank, holding 66,000 gals., over part of the recently-completed reservoir. The work will be carried out from the plans and under the superintendence of Mr. W. A. Harrison, C.E., water-engineer to the corporation.

Captain Hildyard, one of the inspectors of the Local Government Board, attended at the Guildhall, York, on the 8th inst., for the purpose of inquiring into the application of the York Corporation for authority to borrow a sum of £20,000 for street improvements.

SAINT ETIENNE, ABBAYE-AUX-HOMMES, NORMANDY. THE MONASTIC ARCHITECTURE. — ELY GRANGE, FRANT.

OUR LITHOGRAPHIC ILLUSTRATIONS.

SAINT ETIENNE, CAEN.

SAINT ETIENNE, the church of the Abbaye-aux-Hommes, is illustrated in Pugin and Le Keux's "Normandy." The present illustration of the nave will be found to supplement Pugin's in several particulars. It will be seen that actual measurements were obtained for the whole work up to the crown of clerestory windows. The main vaulting-ribs were put in from sketches and observation, and will be found to differ slightly from Pugin's drawing. The carving in the capitals is slightly varied, but the prevailing types are illustrated. The triforium and clerestory are given in Viollet-le-Duc's "Dictionnaire de l'Architecture," Vol. IX., p. 302.—J. A. G.

BUSINESS PREMISES, 31, NORTH-STREET, MANCHESTER-SQUARE.

THESE premises, in the occupation of Messrs. T. Jennings and Son, engineers and lift-makers, consist of entrance-space and storage-rooms, on the ground and basement floors, and show-room on the first floor, the space above being used as a dwelling. The main workshops form a separate building in the rear. Attention has been paid to the method of dealing with the heavy goods of the business, as regards loading and unloading. The vans can drive inside the building, or the iron derrick, shown on the drawing, will lift from a cart standing in the street, and either lower on to a small truck running on a tramway right into the workshops at back, or will lower directly into the basement, through an opening left by the light, in front of shop-window, travelling back on wheels. The brackets terminating in heads, on the upper part of front, can be used for raising goods, and in addition for slinging a cradle, kept on the premises, so that painting or repairs can at any time be done to the front without ladders or scaffolding. The walls are of Bent's white bricks, with red rubbers for the herring-bone work, and glazed at the top. The ornamental tiles on the front are red, but the roof is covered with Red tiles. The building has been carried out by Messrs. Jennings and Son themselves, and the work done on the premises by machinery. The whole has been executed from the drawings of Mr. Walter Henman, and has cost about £10,000. Our illustration is reproduced from the drawing of the premises hanging in the late Royal Academy Exhibition.

THESE premises, in the occupation of Messrs. T. Jennings and Son, engineers and lift-makers, consist of entrance-space and storage-rooms, on the ground and basement floors, and show-room on the first floor, the space above being used as a dwelling. The main workshops form a separate building in the rear. Attention has been paid to the method of dealing with the heavy goods of the business, as regards loading and unloading. The vans can drive inside the building, or the iron derrick, shown on the drawing, will lift from a cart standing in the street, and either lower on to a small truck running on a tramway right into the workshops at back, or will lower directly into the basement, through an opening left by the light, in front of shop-window, travelling back on wheels. The brackets terminating in heads, on the upper part of front, can be used for raising goods, and in addition for slinging a cradle, kept on the premises, so that painting or repairs can at any time be done to the front without ladders or scaffolding. The walls are of Bent's white bricks, with red rubbers for the herring-bone work, and glazed at the top. The ornamental tiles on the front are red, but the roof is covered with Red tiles. The building has been carried out by Messrs. Jennings and Son themselves, and the work done on the premises by machinery. The whole has been executed from the drawings of Mr. Walter Henman, and has cost about £10,000. Our illustration is reproduced from the drawing of the premises hanging in the late Royal Academy Exhibition.

removed. The walls and chimneys are of red brick, and the old tiles are used for the roofing and weather-tiling. The internal fittings will be of varnished pitch-pine. Brokenhurst is a village prettily situated in the middle of the New Forest, and is on the line of the London and South-Western Railway, which has a station very near the building illustrated. It is a favourite resort of naturalists and admirers of forest scenery.

ST. PETER'S CHURCH, PLYMOUTH.

ILLUSTRATIONS of the exterior and interior (looking east) of the above-named church, appeared in the BUILDING NEWS of Nov. 12, 1880, from drawings shown in last year's Academy Exhibition. The present illustration is reproduced from a drawing hung at the Academy this year. The view is taken from the sanctuary looking west. In the rebuilding, the sanctuary and vestries had to be retained. The sacristian being low, and the fault of the site being want of length, it was thought best to keep the sacristian as such entire and form a chancel under the nave-roof. The continuity of the nave-roof and the main lines of the building being thus unbroken from west to east, more apparent length is obtained. In order to give special firmness to the chancel, the arches on either side are filled with early tracery and a low-pierced stone screen divides the chancel from nave. It is proposed to surmount this low chancel-screen with an elaborate iron and brass one, for which the design has already been prepared by the architect. A somewhat novel but rich effect has been gained by placing stone figures of the Apostles in the niches formed in the wall immediately above chancel and transept arches. The whole of the interior walls are faced with unpolished Devonshire marble, the colour of which is extremely beautiful; the columns, strings, and dressings are of Corsham Down stone. The effect gained by the contrast of the warm grey Devonshire marble and the rich, yellow sandstone is pleasing. Considerable difficulties were found to exist in connecting the new and old work, and also in making good the foundations, but these difficulties have been overcome, and the church is now nearly completed, and it is hoped will be opened in October. The work, as previously stated, is being carried out from the designs, and under the directions of Mr. Geo. H. Fellowes Pryne, A.R.I.B.A., of 11, Adam-street, Strand, W.C., the builder being Mr. Alfred Guy, of London.

ELY GRANGE, FRANT.

ELY GRANGE is a property at Frant, three or four miles from Tunbridge Wells, and belongs to F. H. Kay, Esq., for whom the house and lodge illustrated have been erected. The materials are Hooker's red bricks from Dunton Green, Corsham Down stone, local tiles for hanging, and Broseley tiles for the roofs. The chimney-stacks are of rubbed bricks. The exterior woodwork is generally of a dark claret, the balusters being painted white. The house has been planned with a central hall, top-lighted, with a gallery at first-floor level round three sides, and a high chimney-piece against the unoccupied wall. On the main staircase off one corner of the hall is a large stained-glass window, which aids in lighting and ventilating it. The doors, linings, dados, and chimney-pieces to principal rooms and hall are either of oak or walnut, the dining-room and hall ceilings of timber, those of the drawing-room and morning-room of moulded plaster. The work has been carried out by Messrs. George Mansfield and Son, of Tunbridge Wells, from the designs and under the direction of Messrs. Ed. Salomons and R. Selden Wormin, architects, London. The small plan given with the others shows the distribution of the rooms in the entrance-lodge, of which building we hope soon to give a view, as well as ground-plan and details of the Grange itself.

St. Paul's Church, Brixton, S.W., was consecrated on Friday, July 23rd. It is situated in the Ferndale-road. It was built by Mr. Jones, of Gloucester, from the designs of Messrs. H. Herchaw and Fawcner, of Bloomsbury-square, who have made the very best use of the limited space they had to deal with. The lighting arrangements are very effective. They were carried out by Jones and Willis, of London and Birmingham, and we understand the same firm supplied the other interior fittings.

ARCHÆOLOGICAL.

GUATEMALA.—The Royal Museum of Berlin has just received some sculptured stones from Santa Lucia de Consumalapan, in Guatemala, the excavation of which has occupied the attention of the Prussian Government for the past five years. After the visit of Prof. Bastian to the spot in 1876, Dr. Berendt, one of the first authorities in American archaeology, was commissioned to explore the ruins. But, after a short time, he died from over-exposure; and his place was taken by Herr W. von Bergen, the German consul-general in Guatemala, who has at last succeeded in excavating the sculptures and shipping them to Germany.

CHIPS.

We regret to hear that the wife of Mr. James Piers St. Aubyn, F.R.I.B.A., architect, of Lamb-buildings, the Temple, died at their residence in Cambridge-street, Eccleston-square, W., on Wednesday. Mrs. St. Aubyn was in her 67th year.

A monument will probably be erected in Dunfermline Abbey to the memory of Dean Stanley, a committee having been formed for this purpose.

At the half-yearly meeting of the Helston Railway Company, the first held since the passing of the Act, the directors were authorised to enter into a contract with Mr. Maddison for the construction of the line. Mr. S. W. Jenkin is the engineer.

The foundation-stone of a new church was recently laid at Northam, near Southampton. It will be Early English in style, and built of Swanage-stone with Bath-stone dressings. The internal walls will be of stone in chancel and faced with stucco in nave. The church will consist of nave 71ft. 6in. long, and chancel 42ft. deep to east wall of apse, and sittings will be provided for 610 persons. The architect is Mr. Woodyear, of Grafton, near Godalming; the builders are Messrs. Bull and Sons, Southampton, the clerk of works is Mr. Vennell, and the foreman Mr. Dibben. The total estimated cost is £3,794, but only the first section of the building, including the nave and chancel, is being carried out at present.

The boring operations at the Channel Tunnel experimental works near Dover have been suspended for a short time to admit of the removal of some of the machinery. The boring at the Abbott's Cliff heading having been successfully carried to the distance contemplated, the machinery is being removed to the other heading at the Shakespeare's Cliff shaft. Up to the present time, it is stated, the progress of the work has been of the most satisfactory character.

A corona of polished brass bearing 24 burners, has been placed in the chancel of St. Mary's Church, Bury St. Edmunds. It was supplied by Messrs. Benham and Frond, of London.

A new police-station and court-house, erected in the Quay-road, Bridlington, were recently opened. Messrs. Smith and Broderick, of Hull, are the architects, and the cost has been £2,500.

At the half-yearly meeting of the Swindon, Marlborough, and Andover Railway Company, the engineers, Messrs. W. J. Kingsbury and J. R. Sheppard, reported that the first section, that from Swindon to Marlborough, had been opened, and that of the second section, from Savernake Junction to Andover, 71 per cent. of the total earthworks, and 81 per cent. of the bridgework, had been completed, and a portion of the line near Andover completed by the contractors, Messrs. Watson, Smith, and Watson, who had also obtained the contract from the South Western Railway Company, for widening their lines, and effecting a junction with the new line at Andover. It was also reported that the Swindon and Cheltenham extension bill having received the royal assent, that work would soon be commenced.

An inquiry was held at Bedford on Thursday, the 1st inst., before Captain Hildyard, an inspector of the Local Government Board, respecting an application from the town council for sanction to borrow £5,520 for works of paving. It was stated that it was now proposed to pave the footways of the outlying districts, the central thoroughfares having been paved under a former loan, and that after much discussion it had been resolved to use York flags, and not Staffordshire blue brick, as originally intended, as the borough surveyor reported that the greater initial cost would be more than recouped by the better wear of the former material. In several parts of the town blue bricks had been tried, but had been taken up and replaced by York stone. It was suggested in the course of the inquiry by members of the council that blue bricks would be good enough for the smaller streets, but the inspector said the experience of bricks at Brighton had been very unsatisfactory.

Building Intelligence.

BELFAST.—The new U.P. Church in Clifton-street was opened on Sunday week. The style is Scottish Medieval, adapted to meet the requirements of modern churches. The roof is in one span, 41ft. wide and 68ft. long, this dimension being increased to 77ft. above the vestibule. The ceiling is formed with three sides plastered between the semicircular principals. The Clifton-street entrance includes two doorways, each five feet wide, under a moulded and carved series of arches resting on columns of polished red granite. The church is lighted by traceried windows, five at each side, between which are buttresses. The large window above the main doorway is of five lights, with elaborately traceried head, and with moulded jambs. A tower, to be hereafter capped by spire, of important dimensions, is carried up to the level of sill of belfry-windows. The pulpit, pews, and other joinery are of pitch-pine. The pews are arranged in a series of concentric curves, so as to insure an uninterrupted view of the preacher. Behind the pulpit is placed, in an arched recess, canopied stalls and session-room. The walling of the church is of rubble, with cut-stone dressings of Scrabo sandstone. The church is heated with hot water, and the lighting is effected by means of two of Stode's sunlights, which have been executed by Mr. John Dowling, King-street, Belfast. The contractor is Mr. John Smith, who has worked from the plans and under the superintendence of Messrs. Young and MacKenzie. The cost will be about £4,000.

BIRMINGHAM.—The Church of St. Nicolas, Lower Tower-street, which has been repaired and redecorated, was reopened on Sunday. New seats of English oak have been placed in the chancel, and the chancel itself has been extended farther into the nave, and inclosed with a low freestone wall laid with marble panels. The screen, which is of Gothic character, rests upon this, extends the whole width of the chancel, and rises to a height of about 20ft. The western screen has been continued across the south aisle. The church has been redecorated by Messrs. J. R. Lee and Co., of Ann-street, the decorations consist chiefly of bands and pattern-work stencilled on a greenish-grey ground. The plastering between the rafters of the nave has been finished in a salmon colour, and that between the aisles and chancel rafters has been coloured a bluish-grey. Texts have been written upon the walls, and the spandrels of the nave, arcade, and of the windows have been filled in with stencilled pattern-work in Indian and Venetian red and black. The east window has been partly filled in with stained glass, by Messrs. Camm Brothers, the design representing the Crucifixion. The organ has been reconstructed and enlarged by Messrs. Stringer, of Hanley. A new roof has been put to the organ-chamber, and the roofs of the side aisles and vestry have been retiled. The structural alterations have been executed by Messrs. C. Jones and Son, of Belmont-row; and the whole of the work has been carried out from the designs of Mr. John Cotton, architect, of Temple-row, Birmingham. The outlay has been about £350.

EASTBOURNE.—The sea-wall of Eastbourne is being extended, at a cost of £34,000, from the Anchor Hotel to the eleven-gun battery or great redoubt, along the coast in the Pevensey direction; while at the west-end of the Grand Parade the Duke of Devonshire has carried and is carrying the broad promenade, which is now two miles and a half in length, far up the cliff on the way to Beachy Head.

SOUTHPORT.—A new wing to the Palace Hydropathic and Spa Hotel was opened on Friday. It communicates with the main edifice by means of a wide corridor, from which access is gained to the new dining-room, which measures 40ft. by 30ft., and is lighted by windows coming down to the floor-line. Beyond this is the recreation-room, which is 80ft. long, 40ft. wide, and 25ft. high. It is seated for between 300 and 400 persons, has a stage, also available for platform or orchestra, at one end, and a coved ceiling; pilasters of composite design divide the walls into panels. This room will be used for concerts, amateur theatricals, and other amusements. At the end of the corridor a door gives access to a second corridor, lighted from above by means of coloured glass. Leading off from

from this passage are ten gentlemen's baths, all of marble. To each bath two dressing-rooms are attached. At the end of the corridor is the Turkish bath, a room terminating at one end with an apse, into which stained-glass lights are introduced. Attached to this bath are dressing-rooms and a cosy smoking-room. The ladies' baths, which are similar in style to the gentlemen's are reached from a corridor on the opposite side of the wing. Powerful pumping-engines, tanks, filtering-beds, and 1,700 yards of pipes have been laid down for the supply and distribution of the sea-water, which is obtained from the channel at a point facing the hotel. Messrs. Mangnall and Littlewoods, of Manchester, were the architects, and Messrs. Bridge and Son, of Burscough, the contractors. The hotel and new wing were illustrated in the BUILDING NEWS for Aug. 27, 1880, by a general plan and bird's-eye view.

SIDBURY.—Holy Trinity Church, Sidbury, a village six miles south of Bridgnorth, was recently reopened after restoration, from plans and under the direction of Mr. R. Griffiths, of Stafford. The general fabric was found to be in a very dilapidated condition, the whole of the roof having been stripped, and the mortar removed from all the exterior walls. The stonework has been repaired, and partly rebuilt in herringbone to correspond with the old work. The old timbers in the roof (where required) have been removed, and the space between the rafters plastered and left visible, including the bold oak principals. The roofs are covered with tiles obtained from the Billingsley Brickyard. The chancel has a pitch-pine boarded ceiling, formed in panels with moulded ribs. The old timbers of turret have been properly reconstructed, and new louvre-boards to holly windows; new roof to the same provided, covered with tiles, and the apex finished with a wrought-iron ornamental finial. The old porch has been taken down, and a new one built to correspond with the other portion of the work. A new window has been added to the north side of nave, and the whole of the jambs to doors and windows have been cleaned down. A chancel arch has been added, with label and carved bosses. The old stone paving has been removed, and the aisle and chancel are paved with Messrs. Maw and Co.'s encaustic tiles. The whole of the seating in the chancel and nave is in pitch-pine, with moulded bench-ends, the front portion of the seats having traceried fronts. The pulpit and reading-desk have been reconstructed with the old oak framing, with carved panel-fronts. The ancient font has been restored and cleaned. The windows have been reglazed with cathedral glass by Mr. John Davies, of Shrewsbury. The whole of the work has been carried out by Messrs. Nevett Brothers, contractors, Ironbridge, at a cost of about £500, exclusive of stone, which was a special gift. The rectory and outbuildings have been restored in the Elizabethan style by the same firm.

WESTON-SUPER-MARE.—The new Masonic hall erected at the corner of the Waterloo Boulevard and Longton-grove road, by the St. Kew lodge, was opened on Monday with an art exhibition. The hall has been built from the designs of Messrs. Hans Price and Wooler, architects, of Weston, Brother S. Taylor Harvey, of the same town, being the builder. It is in the Late Tudor style, and is faced with Bath stone, laid in irregular and narrow courses. At the corner nearest the boulevard is a tower having a projecting embattled and panelled cornice, resting upon bold corbels. Above is a low, half-timbered roof, terminated by a flat-pitched spire. The windows throughout the building are large, and are divided by stone mullions and transoms. The upper parts are filled with coloured glass in dull tints, geometrically arranged. In sunken quatrefoil panels, along the upper part of the facade facing Longton-grove road, are shields bearing various Masonic emblems. The two entrances are moulded and carved, particularly the main one. Over this is a recessed and canopied niche, whereon stands a sculptured figure, in Ketton stone, of the patron saint, St. Kew. This statue is the work of Brother Harry Hems, carver, of Exeter, by whom also all the ornamental carving in stone and wood throughout the building has been done. St. Kew, who is rather under life-size, is represented in the dress of a Somersetshire recluse of the 15th century. The carved work on the building is all in the local Perpendicular style of Gothic ornament. The lodge-

room itself has an open-timbered roof, ornamented by carved wood bosses, which have a double duty to pay, for they are at once ornamental stoppings to the mitres of the timbers and serve as ventilators. In the billiard-room is a carved stone mantelpiece. The whole of the interior wood fittings are stained deal, framed on to pitch-pine panels. The front, facing the boulevard, is separated from the road by an embattled wall. Almost immediately opposite to it is the new Church Institute, which has also just been erected from Messrs. Hans Price and Wooler's designs.

WHITFIELD - COURT.—Extensive alterations have been carried on at Whitfield-court, South Herefordshire, the seat of Mr. and Lady Katherine Clive, during the past 2½ years, from the plans and under the superintendence of Mr. Cheiako, architect and county surveyor. Viewed from the outside, the most conspicuous change in the mansion consists of its enlargement by the addition of a new block on the south-west. The principal apartment added is a drawing-room, measuring 41ft. long, by 24ft. 6in. wide, with a height of 22ft. in the clear, in addition to an octagonal bay window. The walls of this block are 3ft. thick, faced with stone from the estate, worked in their courses, and lined with brick inside, so as to guard against damp or uneven temperature. The approach from the library to the drawing-room is through a secret book-door, and behind a triple arcade, opening immediately into the drawing-room. This arcade consists of three arches, resting upon twisted columns with caps and bases, the latter being supported by a carved plinth. There is also an entrance from the first landing of the principal staircase to the drawing-room through a richly-carved door, which Mr. Clive purchased in Florence. This door was sent to Whitfield, and designs made for having it encased in jambs to match. This portion of the work, as well as the book-shelves and the arcade from the library, was executed by Signor Berrani Piazza, Santa Maria, Novella, Florence. It is worked in Italian walnut, polished, with the mouldings relieved by gold. The floor of the drawing-room is of parquetry, and was constructed in Venice and sent to England in pieces of about 2ft. by 2ft. All the rest of the woodwork is teak, with the exception of the chimney-piece, which is constructed in wainscot oak. The fireplace is open for burning wood, having Portland stone moulded inner jambs and head, with richly-coloured tiles and cast-iron ornamental back. The hearth is laid with inlaid tiles of mosaic design, and is furnished with antique brass firedogs. The ceiling is executed in plaster, with moulded and enriched ribs, forming panels adorned by foliage decorations. Underneath this ceiling is a moulded cornice and enriched frieze, which have been decorated from the design and under the superintendence of Lady Katharine Clive, while the cove, executed by her ladyship's own hands, represents 26 cherubs, with double sets of wings, the interspaces between each pair of cherubs being filled in with wreaths of fruit and leaves. A new principal staircase has been constructed in wainscot oak, with open-timbered roof above it, of oak grown on the estate. Balustrading has been placed upon the parapets, going round the entire building. The gardens have been rearranged, the terrace extended, and a new carriage-drive formed. On the sheep-walk, a reservoir holding 25,000 gallons of water has been constructed. The water supply arrangements have been carried out by Messrs. Easton and Anderson, Whitehall-place, London, whilst Messrs. Rosser and Russell, of Charing-cross, London, have furnished the heating and hot-water supply to housemaids' closets, baths, &c. Mr. James Bowers, of Hereford, has been the contractor for the whole of the works. The carving was intrusted to Mr. Robert Clarke, of Hereford, and the bell-hanging, gun-metal casements, and other works of this kind, were executed by Mr. W. Letharen, of Cheltenham. Mr. Clive has, within the past few months, caused to be erected in the neighbouring church of Wormbridge, a new chancel arch and east window (the latter being filled with fine stained glass, in memory of the late Mr. and Mrs. Clive), and has otherwise beautified the church from the plans of Mr. Cheiako; the immediate restoration of St. Devereux Church is contemplated by those interested in the parish, and the same architect has prepared plans and specifications for carrying out the works.

COMPETITIONS.

DUBLIN SCHOOL OF ART MUSEUM.—The Commissioners of Public Works for Ireland announce that they are prepared to receive competitive designs from architects for the museum of science and art, which it is proposed to erect in a site adjoining Leinster House, Kildare-street, Dublin. A block plan of site, with a statement of the conditions of competition, has been published.

FULHAM WORKHOUSE INFIRMARY.—The building committee of the Fulham board of guardians examined on Tuesday thirty sets of designs sent in for the new infirmary, but came to no conclusion upon them, except to recommend the board to call in as professional adviser the President of the Royal Institute of British Architects (Mr. G. E. Street, R.A.). The board were to consider this suggestion at their meeting yesterday (Thursday). After a decision has been arrived at, the designs will be publicly exhibited.

MANCHESTER.—A premium of £50 is offered for the best plans and concisely-written suggestions for covering over the Irwell, having regard to utility, beauty, and economy, showing the best arrangements of the open space, the best approaches and gradients to the new station, the best utilisation of the Salford land up to the Salford Bank for a station, with the least injury to Chapel-street, stating advantages, and giving approximate cost.

OLDHAM.—The time for sending in designs for the Oldham Free Library and Museum has been extended to the 5th October. The limit of cost is £5,000.

WOODSTONE CEMETERY.—The premium of five guineas offered by the burial board of Woodstone, near Peterborough, for plans and specifications for fencing in the new cemetery in Woodstone-lane, and for erecting thereon a boardroom, has been awarded to Mr. J. R. Naylor, of Derby. The estimated cost of work was not to exceed £130.

CHIPS.

The Liverpool Corporation, as part of a water-scheme, are about to erect a water-tower at Norton, Cheshire, and from thence nine miles of 42in. cast-iron socket-pipes will be laid to Prescott, Lancashire. The total weight of iron in the mains is estimated at 12,000 tons. Mr. Thomas Hawley, of Westminster, is the engineer-in-chief, and the work will be carried out under the superintendence of the engineer to the corporation, Mr. G. F. Deacon.

A quantity of relics, which bear marks of Roman origin, have been found in an ancient grave at Oensingen, in Solothurn, Switzerland. Among them are swords, daggers, round and flat buttons, painted glassware, and a number of ornaments made of a substance supposed to be fossil gum, but probably a composition. The graves, only two of which have been opened, are lined with masonry and vaulted. The appearance of the ground gives reason to suppose that it was once the site of a cemetery, and that it contains many more graves, which it is proposed to open and examine.

The new High School for boys at Oxford was to be opened last (Thursday) evening by Earl Jersey. The school is erected in George and New Inn Hall streets, with the chief frontage to the former thoroughfare. The style is Renaissance; the architect is Mr. T. Graham Jackson, M.A., of Devereux-court, the Temple, W.C., whose designs were selected in competition. Mr. Claridge, of Banbury, is the builder, and Mr. Meekford the clerk of works. We illustrated the principal facade of the school on Feb. 13th, 1880.

Horncastle is about to be provided with a new water-supply from springs at Cawkwell, which are estimated to furnish a minimum supply of 60,000 gallons per day. Mr. Teague is the engineer, and Mr. Thorpe the surveyor.

The town-council of Newcastle-on-Tyne resolved, on Thursday week, to construct the southern portion of the sheep-market, with wrought-iron pens and cement flooring, at an estimated cost of £1,300, and the finance committee were authorised to accept the lowest tender for the work, which will be carried out under the supervision of Mr. A. M. Fowler, borough engineer.

A commencement has been made with the extension of the tramway system at Newcastle-on-Tyne, from the borough boundary on the Moor Edge to the village of Gosforth. The work is being executed by Messrs. Ridley and Co.

"To a practical man with a taste for mechanics, and the bumps of construction fairly well developed, we can conceive no more mentally tiring than a couple of hours spent over the June numbers of this truly marvellous publication the *Eng. Archt.* In a hundred and fifty odd pages that make up the bulky mass of the paper, there is recondite information on almost every conceivable subject, ranging from how to construct a mouse-trap, to the latest method of calculating the phases of Orion."—*The Architect*. Price Two-pence of all newsmen, or post free 2d.—3, Tavistock-street, Covent-garden, W.C.

TO CORRESPONDENTS.

We do not hold ourselves responsible for the opinions of our correspondents. The Editor respectfully requests that all communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondence.

All letters should be addressed to the EDITOR, 31 TAVISTOCK-STREET, COVENT-GARDEN, W.C.

Cheques and Post-office Orders to be made payable to J. PASSMORE EDWARDS.

ADVERTISEMENT CHARGES.

The charge for advertisements is 6d. per line of eight words (the first line counting as two). No advertisement inserted for less than half-a-crown. Special terms for series of more than six insertions can be ascertained on application to the Publisher.

Front Page Advertisements 2s. per line, and Paragraph Advertisements 1s. per line. No front page or paragraph advertisement inserted for less than 6s.

SITUATIONS.

The charge for advertisements for "Situations Wanted" is ONE SHILLING for TWENTY WORDS, and SIXPENCE for every eight words after. All Situation advertisements must be prepaid.

Advertisements for the current week must reach the office not later than 5 p.m. on Thursday. Front page advertisements and alterations in serial advertisements must reach the office by Tuesday to secure insertion.

TERMS OF SUBSCRIPTIONS.

(Payable in Advance.)

Including two half-yearly double numbers, One Pound per annum post free to any part of the United Kingdom; for the United States, £1 6s. 6d. (or 6dols. 40c. gold). To France or Belgium, £1 6s. 6d. (or 3fr. 30c.). To India (via Brindisi), £1 10s. 10d. To any of the Australian Colonies or New Zealand, to the Cape, the West Indies, Canada, Nova Scotia, or Natal, £1 6s. 6d.

Cases for binding the half-yearly volumes, 2s. each.

NOTICE.

Now Ready.

Vol. XL. Price 12s. A few bound volumes of Vol. XXXIX. may still be had, price Twelve Shillings; all the other volumes are out of print. Most of the back numbers of former volumes are, however, to be had. Subscribers requiring any back numbers to complete vol. just ended should order at once, as many of them soon run out of print.

"BUILDING NEWS" DESIGNING CLUB.

J. HOLLGATE. (The award will be published shortly.)

Correspondence.

FULHAM INFIRMARY COMPETITION.

To the Editor of the BUILDING NEWS.

SIR,—It is rumoured that some drawings sent in for this competition are likely to be excluded, on the ground that they are "coloured drawings," and consequently not in accordance with the terms of the competition.

I am desirous of asking your opinion whether a light wash of colour over the whole area of the land to be devoted to the use of the infirmary (including airing-yards, &c., &c.), and laid on simply to show that no buildings are beyond the restricted boundary of the land set apart from other land belonging to the Union has been encroached on by the Infirmary building; the plan of the buildings, yards, &c., being wholly drawn in Indian ink line, and the walls etched—can be considered or construed into a coloured drawing.

A reply in your issue of this week, if possible, may be the means of preventing an injustice being unintentionally committed by the Guardians, who will have the matter under consideration next week.—I am, &c.,

A COMPETITOR.

EXTRACT FROM INSTRUCTIONS.

No. 8.—Those drawings are to be made to a scale of 1 inch to a foot, and are to be finished as line drawings with Indian ink only.

No. 10.—All drawings to be mounted on plain strainers. No framed or glazed drawings, and no perspective drawings, will be received.

[Having regard to the clause No. 8 of the Instructions, we certainly think a plan tinted in the manner our correspondent describes is excluded by the terms.—Ed. B. N.]

EXPANSION OF CEMENT AND CONCRETE.

SIR,—That Portland cement concrete is subject, in a certain degree, to change of form through variations of temperature is a fact; but my experience differs in the results from some others of your correspondents. Mr. Petrie instances a case where the concrete paving-flags of a street were moved out of position by a rise in temperature, and of steps being split across the ends through the worn centre portions being cut out and refilled with cement. But the latter method of repairing worn steps has been done in thousands of cases, and personally, I have never noticed a similar result. A continuous concrete floor on iron girders, 10ft. from the ground and 142ft. in length, which was constructed about two years since, has, up to the present time, certainly not disarranged the perpendicular line of the end walls in a perceptible degree; and this should be a good test of the behaviour of concrete in the slab form. The fact is that cement, in most cases, is used too fresh from the manufacturer's, but if sufficient time were allowed for the coarser-ground particles to slake (should the user be unable to obtain it ground sufficiently fine to avoid this necessity), no very bad results would ensue. The expansion and contraction of concrete are probably about the same as brickwork, and if the material were usable in the same way as bricks, the changes would be equally as unnoticeable. The fine cracks found on cement after it has been applied, might be avoided if a sufficient time were allowed for it to rest before use, or if it were passed through a fine-mesh sieve so as to eliminate the coarser particles. The use of the strips of wood to divide concrete paving or concrete floors (when laid *en masse*), into compartments, and afterwards filling up the crevice when the wood is withdrawn, with cement or lime mortar, is an advantage. I have tried this for a long while, and find that when shrinkage does take place the result is a straight crack, and one open joint is certainly preferable to an infinity of small cracks. That the poorer the concrete, the less the signs of contraction or expansion, is certainly not my experience; the more necessity there was for avoiding change of form, the greater the proportion of cement I should use. On the other hand, the worst specimens of concrete I have seen have been those where the proportion of cement was a small one. It is against all theory, but the concrete walls least liable to crack are, I find, those where blue lias lime and no cement whatever has been used; and this applies to walls a hundred feet in length or more. Is it owing to there being less rigidity and more elasticity in lime concrete than in cement concrete? Where blue lias lime is used as a matrix very great care is necessary. The nature of the aggregate has a good deal to do with the change of form concrete is liable to, for I have found the least signs of contraction and expansion when slag from iron ore has been used, and the most when river or pit-gravel of too great uniformity of size, and its angles rounded by attrition, has been employed. While on the question of the contraction and expansion of limes, can any reader state what lime and sand were used for the mortar of the brick inclosure wall of the new Military Barracks at Devizes, built about two years since, and which appears ready to fall at any time? A cross section of the same, instead of appearing perpendicular, and straight, would more resemble that of a dome. This peculiar curve must be surely due to the expansion of the lime, as no settlement would produce such a result.—I am, &c.,

Alresford, Hants.

THOMAS POTTER.

UNTRAPPED GULLY-HOLES.

SIR,—I can vouch for the accuracy of what I said on page 282. What proves pretty conclusively in my mind that the sewer-gas was the cause of the typhoid fever is that both persons caught it at the same time.

I wish every person who takes the trouble to carefully ventilate his own drains would, at the

same time, attach a ventilating-pipe to the sewer side of his trap. If this were done at every house the effluvia from the sewer would be very much less obnoxious. Attention has often been drawn, in the *BUILDING NEWS*, to this way of ventilating the sewer; but it is not to be expected that people will go to this expense "pro bono publico" without being compelled to do so by Act of Parliament.

It strikes me as being rather anomalous that we should have an Act of Parliament with regard to the building of our houses, but not one having regard to the draining of them. Surely the latter is quite as important a point; and seeing how various, and very often mistaken, the notions are concerning sanitary matters, it seems to me the sooner we have some law on the subject the better.—I am, &c.,

C. F. M.

61, Bedford-gardens, Kensington, W., Sept. 6.

DAVIES' O-TRAP.

SIR,—Your correspondent "H. B." has written in your last issue a letter which, in justice to myself, calls for a reply.

I refer to that part wherein he says there is but a trifling difference between my method of striking the O-trap and the proper (?) method in general use—viz., 12in. across the cheek, &c. First let me ask what is the proper method? as, until I first struck the O-trap with the compasses and the right line about 25 years ago, I knew of no method of striking it excepting by rank rule of thumb. I, of course, knew then that my system was far from perfect, as I could not depend upon the length of the outgo in different-sized traps.

This last addition is my complete geometrical trap, and is, I believe, as near perfection as possible. I am quite aware that at least 80 years ago plumbers had a mania for striking traps geometrically; but what did they do? Simply struck a rounded bottom with heel and outgo perpendicular to the top line. If this is what "H. B." means, of course he must then have a 12in. circle; still, I cannot think he intended this. Does he call my rule of first striking 9in. circle and 12in. from heel to outlet, with the outlet line striking the belly at a true tangent, the proper method? If so, he cannot be aware that this system was mine originally, and I first put it on record in 1858, and that he is consequently paying me the greatest compliment I ever received.—I am, &c., P. J. DAVIES.

SIR,—I went to the discussion on Mr. Hellyer's lectures, at the Society of Arts rooms, on the 13th of August last, and saw Mr. Davies test his model O-trap. I have also read with great interest the correspondence published in your columns, between Mr. Emptage and Mr. Davies upon the subject. Mr. Emptage describes this model business as being "most misleading." I think this is too mild a term: to my mind it is insulting (although not intentional) to our common-sense as practical men, because it supposes that we do not know the difference between a small draught trap placed beneath a lavatory basin, and a full-size soil-trap beneath a w.c. I know Mr. Davies personally and have great confidence in his abilities, and I feel sure he would not have been led into this mistake had not Mr. Hellyer himself set him the example. I have spoken to several working plumbers upon this matter, and find they entertain the same opinion, and are, like myself, watching the course of the arguments.

I only know Mr. Emptage from the paper which he read at the discussion, and his subsequent letters. These, however, are to my mind quite sufficient to show that he is fully up in this matter, and I would suggest to him the desirability of discontinuing this toy play, which is most bewildering, and give us the results of some real work, for by so doing he will be giving useful information to many.—I am, &c.,

A PRACTICAL PLUMBER.

Kensington, September 12th.

SIR,—I have tested my model O-trap, made after Mr. Davies' plan, and with it, at the same time, Dent's 2in. T and S-siphons. My arrangements were the same as Mr. Davies used at the discussion, viz., pail, with 2in. valve, and 1½in. pipe, with 9in. fall into trap. I put into the body of trap a handful of pebbles, 114 in number. Three pints of water cleared them all

out; two pints would not do so. I tried this six times, and the most I sent out at one time was 14. Now, I was curious to know how Mr. Davies had managed to clear them, as he says, with one pint of water. I therefore placed in dip-pipe a funnel 13in. long, 4½in. diam. at top, and 1½in. at bottom. With one pint thrown down this funnel I cleared all out but 20, and this was the best I could do. With two pints I could not clear all out, but left in three or four. I put in a piece of flannel, which took three separate pints to send it through.

I now repeated the same tests with Dent's 2in. T and S-siphons. I could see no difference in the effect between these and the O as regards the gravel test, but with the flannel there was a marked difference, ¾ pint clearing as well as did one pint with the O. On looking at and thinking over these arrangements, I was struck with the folly of trying by such means to ascertain the action of a w.c.-trap: for instance, under what conditions is it possible to fix a w.c.-trap that there shall be a direct fall of 3ft. between the basin and the seal of the trap? Again, the w.c. basin is always flushed by a discharge from a pipe to the arm of the basin, and not by a pail of water thrown in.

I, therefore, determined to put the small traps on one side, and to carry out my trials with my proper w.c.-traps. This I propose to do in the fullest manner, in order to clear up this long-standing dispute as to the superiority of the O over the O-traps. I have fitted up a flushing tank 6ft. above w.c., with 1½in. pipe to arm of basin. This will enable me to compare flushes in the ordinary way with that of pails thrown in. I intend to test the traps fixed below valve-pans and direct-action closets, and will forward to you the results.—I am, &c.,

DANIEL EMPAGE, S.E.

Danehill Sanitary Works, Margate, Sept 12th.

TERRA-COTTA.

SIR,—I notice an extract from the *Guardian* in last week's *BUILDING NEWS*, and am pleased to find terra-cotta so well approved. But having manufactured the material for both works mentioned—viz., the Natural History Museum and Messrs. Christy's, No. 1, Old Bond-street, must protest against the assertion of its alarming (money "no object") cost. Terra-cotta will bear very favourable comparison on this point with any material for facing buildings (setting aside its undoubted durability), and should a repetition of parts occur, is at a still greater advantage, particularly so if the repeated parts are enriched, and this will be confirmed by any architect who has had experience with it. Hoping this will show terra-cotta as more available than your paragraph would suggest,—I am, &c.,

CHAS. WHITFIELD,

Manager for Gibbs and Canning, Tamworth, Sept. 13.

VENTILATION OF SOIL-PIPES.

SIR,—In regard to the ventilation of waste-pipes a good deal depends upon the position of the appliance, and how the ventilation is carried on, as also upon how the ventilating-pipe is joined. As Mr. Davies on page 345 refers to sinks specially, and to their discharging into or over disconnecting traps, I shall simply deal with them here. One plan which I understand Mr. Davies disapproves of is putting in the waste-pipe without a lead siphon-trap, and its outer end exposed to the open air. This I join in condemning, because the waste-pipe then acts as a stinking air inlet-pipe to the house. This plan is apt to cause sore-throat and blood-poisoning to the inmates. Another plan is to use the lead siphon-trap close under the sink with the outer end of the waste-pipe discharging over the grating of a gully-trap outside. This does very well so far as the sink is concerned, although it often happens that around the grating of the gully-trap tealeaves and pot and dish washings will be seen exposed to view in a nasty, dirty-looking manner. I do not like this style. Another plan, and still using the lead siphon-trap inside, is to make the waste-pipe discharge under the grating as into one of my disconnecting ventilating drain-traps. This is the plan I generally adopt myself, and I think I lately observed Mr. Rawlinson, C.E., also stating he preferred the waste-pipe to discharge "under" the grating.

In these last two plans some put in a ventilating pipe from off the top of the out-go of the trap to prevent gases lying in the waste-pipe. Mr. Davies seems to think this will cause the water in the trap to freeze much more easily. That depends upon circumstances. If there is only one sink I do not

think it will matter much. The hole where the waste-pipe passes through the wall not being tightly built, is ten times more apt to cause freezing than the air-pipe. When the air-pipe is being joined it should be so pointed as to direct its air in case of a back-draught away from the water in the trap and not right on to it, as is often unthinkingly done. In the case of only one sink near an outer wall, and the waste-pipe discharged 2ft. under the grating, the frost from the small air-pipe can have little effect. If wished during a long frost the top of the grating could be temporarily covered with a bit of old carpet, &c. This is much better than having a month's accumulation of slops flowing all over the ground, as I have sometimes seen with exposed waste-pipes discharging over gratings. Lastly, as to the plan Mr. Davies speaks of—viz., not using a lead siphon-trap, but instead dipping the outer end of his waste-pipe below the surface of the water in the outside disconnecting-trap. This plan is better than having no trap inside, although inferior to having the lead siphon-trap inside. The outer end of the waste-pipe should only dip slightly under the water—the less the better; for this reason, that less than ½in. of cover is sufficient to prevent blow-in, whilst with only a small cover, when the water is discharged from the sink, it may easily force this outside seal before it, and so push out the bad air that may have accumulated in the waste-pipe, whereas with a deep outside seal this may not be managed, and so stinking air may more readily be smelt. This is one reason why "the further the end of the pipe enters the trap the more objectionable it is."

The unsanitary inspector's plan of no trap on waste-pipe is very bad. Mr. Davies' plan of dipping its outer end under water is an improvement upon that, especially if the dip is small. The proper plan is to have a siphon-trap as close as possible to the appliance, and the outer end of the sink's waste-pipe discharging under the grating of a properly ventilated and set disconnecting-trap. If wished, I will give sketches of the plans above described.—I am, &c.,

W. P. BUCHAN.

SIR,—Mr. Emptage declares "the necessity of an efficient orifice: this is, in fact, all my contention. Thus the controversy between us is narrowed to the question, What is an efficient orifice? Hitherto I have maintained that any size of orifice, small or great, is (in proportionate degree) efficient, and that a ½in. pipe is satisfied and economically effective. This is, only in part, contradicted by the results of the interesting experiment described by Mr. Emptage. If that description is correctly and accurately recorded, I must conclude that something larger than a pin's-point puncture is necessary to prevent siphonic action. I purpose closely testing the suggested experiment in different sizes of pipes, from ½in. to 4in. bore, and will report the result of my investigations in a future letter.—I am, &c.,

MICHAEL DEURY.

VICTOR EMMANUEL MEMORIAL.

SIR,—It would appear from a letter from Baron Heath, the Consul-General of Italy, in the *Daily News* last week, that the monument about to be carried out in Florence has nothing to do with the competition in question. This will explain the mistake, which, however, is not mine, and I do not know that I need apologise for drawing attention to the matter.

The original misleading announcement in the *Daily News* was given officially, and with many circumstances and detailed particulars in confirmation.—I am, &c.,

12th Sept.

COMPETITOR.

LEAMINGTON SPA COMPETITION.

SIR,—Has any decision been arrived at respecting the proposed public buildings at Leamington Spa, for which designs were invited some months ago? Surely it is time some announcement was made public.—I am, &c.,

Sept. 11th.

OBSERVER.

There was a large attendance and a spirited competition for the front lots at Mr. R. J. Collier's sale last week of building-land at Eufield. The total sale was £2,431.

During the first six months of the year the London and North-Western Railway Company spent £19,175 on improving and increasing the accommodation at its London stations, £52,133 on that of its Liverpool stations, and not less than £123,150 on additional accommodation at its Manchester stations. The expenditure at all the three great centres of the Company is being continued during the present half-year.

At Tuesday's meeting of the Dunfermline town council, the account of Mr. French, the contractor for the recently-completed waterworks, was presented and proved to be £3,389 1s. 3d. in excess of the price which Messrs. Leslie, of Edinburgh, the engineers, had recommended should be paid. The account was returned for details to be added.

Intercommunication.

QUESTIONS.

[6532]-Nuisances within the Law.-A man proposes to bring cement works near to a residence. How near may such works or a brickkiln be brought within a dwelling without infringing the law?—W. B. AND L.

[6533]-Monuments.-Would any of your readers kindly inform me whether the designer of Sir Walter Scott's monument in Edinburgh was a mason or joiner?—R. H.

[6534]-Dimensions of School.-In designing schoolrooms, what is the usual number of square feet to allow for each child? Also, what is the best proportion of length to breadth for a standard school?—A. S. S.

[6535]-Museum Roof.-Does any reader know of a thoroughly good museum-shaped roof without the beams or collars, and not constructed on a flat? If so, would he kindly explain the construction?—S. S.

[6536]-Round Timber.-Will some reader be good enough to give me the name of a good book on conversion and uses of round timber, and oblique?—P. H. G.

[6537]-Architect's Prospects in Australia.-Is there any chance of a person who has been two years in an architect's office and measured the buildings in a similar office in Australia? If so, which would be the best city to go to—Melbourne, Brisbane, Sydney, or Adelaide? 3rd. What is the salary likely to be?—N. Y. Z.

[6538]-Ventilation.-Being about to erect a ball-room on the ground floor of a small building, I would feel very grateful if any of your numerous readers would kindly give me in plain words what would be the best method of ventilating the room. The room is 20 ft. by 10 ft. and the walls are 12 ft. high from floor-level to window-sill. There are two windows in the side wall, and one in the front, each 6 ft. by 4 ft. The roof is supported by a row of posts in the ceiling. The height from floor-level to ceiling posts is 10 ft. 6 in. —R. G.

[6539]-Sandial-Plate.-Can any reader of this column tell me how I can obtain an engraved plate for a sandial?—S. S.

[6540]-Plasterer's Work.-In measuring up plasterer's work, should one only should the cornice be measured in the ceiling and walls, and how would you measure run of cornice?—W. G. G.

[6541]-Science and Art Exam. in Architecture.-Would some correspondent who has passed the above give me some information concerning it, and mention where I could get copies of past examination papers? Also the best book for pursuing the necessary knowledge of the subject.—J. F. T.

[6542]-Roads.-Will any of your readers inform me the price per yard super. of the Val de Travers compressed asphalt pavement, as laid in the metropolis, and also of the improved road pavement, both to include the concrete foundations requisite?—T. S. S.

[6543]-Road Material.-Will Hugh MacLachlan or any other influential reader inform me how many yards or loads of ball core and of ballast a 40 ft. road will require per lineal foot or otherwise, the hard core to be 18 in. and the ballast 4 in. thick?—T. S. S.

[6544]-Disinfecting Stoves.-Will some kind subscriber inform a constant reader of this journal who manufactures the best disinfecting stoves suitable for various wards, such to be sufficiently large for fumigating lods as well as wearing apparel?—B.

[6545]-Rain, &c., Penetrating into Building.-I have just erected an Elizabethan building, the timbers composing the framework being grooved to receive the panels, which are formed of strong lath-and-plaster, coated over with cement. In extreme weather the rain penetrates through the joint between the panels and framework to the inside. In order to remedy this I had thought of raising out the joints, and pointing with putty and white lead. Can any of your readers suggest a better plan?—B.

REPLIES.

[6532]-Baptistery.-It may be made from 6 ft. to 8 ft. long, by half that width, and having a depth of 6 ft. and about, with water sufficient for baptismal services from 2 ft. to 2 ft. 6 in. deep. Five or six steps will be necessary to lead down into the bath and fixed inside it. The walls should be of at least 1 1/2 bricks thick built in Portland cement, and backed up by the earth round. The floor may be of concrete, or of brick, and covered with glazed tiles laid in cement, and the walls of the same, instead of lath and plaster. It should be fitted with a 1 in. or 2 in. service pipe with key outside, and drain and overflow pipes, an 1 1/2 in. diameter. The service pipe should lead off from the bottom of the bath. The whole should be covered when not in use by strong framed and locked covers in the form of a door, to be lifted when required by means of stout counter-sunk drop-handles of iron or brass.—H. H. MacLachlan.

[6533]-Pencil Sketches.-As to these I have found nothing better than ordinary paper. I happened once to use a sheet of water in slightly shading a pencil and sepia sketch, and then found it fixing the pencil work. I have washed the sheet with beer to start with.—W. K. B. B.

[6534]-Architect's and Valuer's Licence.-The information given by "W. B." in the Secretary of Inland Revenue at Somerset House shows that an appraiser's licence is necessary for a valuer, but it does not answer the question, if it is so many architects and surveyors measure and value work every day without a licence? There is no doubt that the profession in general ignores on this point, and custom at least has sanctioned the practice of surveyors without licence valuing the work, so that if a licence is necessary at all, nine-tenths of the valuations made on buildings have been made

without legal sanction. I am inclined to think the opinion given is hardly satisfactory till the above facts have been explained, and I am alluding chiefly to architects and surveyors who often value work. If the valuation is made of their own works, I do not think a licence is required. Of course, for those who practise as valuers and arbitrators, it is necessary.—G. H. G.

[6535]-Books on Construction.-I consider the little work by Dobson, "The Art of Building," to be one of the best, notwithstanding the mistakes in the theoretical part of it; it is one of Weale's series. Tarn's "Science of Building," published at 8s. 6d., will make good the defects of the last. Perhaps the best work is Rankine's "Manual of Civil Engineering," but the student thereof must be well acquainted with mathematics. There are other works on construction by Aschpitzel, Eckert, and Dobson, which I believe will be found useful, though have only an acquaintance with the first. It also considers the styles of architecture. I am doubtful of any works on construction approved by the Science and Art Department; they are generally prepared by men with little or no practical acquaintance with the subject. I do not condemn the work recommended by Mr. Freeman, but would not invest therein until I had looked well into it. I took in Scott Burn's "New Guide to the Country," when it came out about seven years ago in parts, and consider the money as good as wasted. Tredgold's, though an older work, is to be preferred, and I believe is Nicholson's. Pacey's "Gothic Moldings" gives advice on their measurement, with other most valuable information, and illustrations on the subject. The best way for student to learn architectural sketching is by practice. I believe there is no good work on it; read the last "B. N." leader on "Holiday Work." For Gothic architecture Mr. Hickman's work, recommended by Mr. Freeman in his answer to No. 6528, should be read; also works recommended in my answer to No. 6529. "The Principles of Gothic Architecture," by P. H. M. is now very antiquated, even the latest editions. "Architectural Student" should also look up answers to "B. N." last volume.—Hugh MacLachlan.

[6536]-Government Berths.-If "A. J." would write to Mr. Henry Tanner, H.M. Office of Works, Whitehall, asking him to oblige; I believe he could ascertain what he requires.—Hugh MacLachlan.

[6537]-Fumigating Oak.-Oak is fumigated by liquid ammonia, strength 880, which may be bought at any wholesale chemist's at five shillings a gallon. The wood must be placed in a dark and air-tight room or compartment, and plates or dishes of ammonia stool upon the ground. This done, shut entrance and secure cracks with pasted strips of paper. Remember, the ammonia does not touch the oak; the gas acts in a wonderful manner upon the tannic acid in the material, and browns it so deeply that a shaving or two may be taken off without removing the colour. The grain is not raised in the least, and the depth of shade will entirely depend upon quantity of ammonia used, and the time the wood is exposed. Try an odd bit first, and then use your own judgment.—H. H. G.

[6538]-Work Expected from Ex-Pupils.-They should, at least, be able to trace and copy drawings well. B. sides this, many ex-pupils are able to work out ordinary details, prepare working drawings from sketches, write simple specifications, and even to design. It will depend upon how long the ex-pupil has been articled, whether for three or five years, the opportunities of learning, the advantage he has taken of them, how hard he has worked, and his natural abilities. The wages would, of course, likewise vary, say from ten shillings to two guineas per week. I expect there is not much difference between English and Scotch offices, and know several who, brought up in the latter, are now in London offices.—Hugh MacLachlan.

[6539]-Work Expected from Ex-Pupils.-"Scotch Youngster's" question cannot be fully answered without knowing his capabilities. As a general rule, a pupil who has served his time is expected to be able to draw pretty well, to be able to get out plans from rough sketches, to make elevations with tolerable accuracy from sketches, also sections. With regard to wages, he must not expect much at first, though this will depend on the progress he has made, and his power of drawing. Generally speaking, if he gets in the first office, say 15s. a week, he may be content, and a considerable master will not grudge to increase this wage after the first year. A pupil just out of his time, however, often goes as an independent, and expects to give his services at a nominal salary for the experience he gains. In a good London office he might get 30s. a week, or more; he can make himself useful. The difference between a Scotch and English office is trifling, except as regards draughtsmanship is mainly required, but it would be better to go into an office where general work is done at first, and an office in a large provincial town is preferable for gaining general experience.—G. H. G.

[6540]-Land Agent.-One of the best and most comprehensive treatises I know of is Ryde's "Handbook for Architects, Surveyors, Valuers, &c." For calculating value of estates, Hudson's "Tables for Land Valuers" is a useful compendium of tables, and also "The Appraiser, Auctioneer, House and Estate Agent's Pocket Assistant," by Wheeler. The latter contains inventories and prices. We may also recommend a very useful guide on "House Property," by E. L. Turbuck; Inwood's "Estate Tables," all of which books are published by Crosby Lockwood and Co. There is also a work on "Auctioneering," published by the same firm.—G. H. G.

[6541]-Powers of Urban Sanitary Authorities.-Of course they have power to refuse. "D. H. V. T." would not think of so building over the ground of a neighbour, and he has equally no right to build over public ground without permission, it is not his own. If the authorities were unable to refuse, narrow streets or ways might be so bridged across, or stry pointed over story as in the middle ages, that the streets would both be deprived of daylight and ventilation. Permission is sometimes given, in which case a favour is conferred by them; but such permission can be considered as a precedent for a claim, and so might lead to abuse, therefore authorities are rather chary in such favours. I cannot imagine anyone contesting the point with them, and certainly know of no cases tried.

though grumbling at refusal is no common occurrence.—Hugh MacLachlan.

[6542]-Powers of Urban Sanitary Authorities.-The urban sanitary authority have power by their by-laws to prevent overhanging structures such as balconies. I am not able to refer to a case that has been tried.—G. H. G.

[6543]-Iron in Structures.-Smith's work includes the fixing and setting up of iron work in buildings, though the terms "Ironfounder" or "Engineer" would be more appropriate in describing such work in the specification. The firm which supplies the ironwork usually undertake to fix it in the building, and they employ men for that purpose.—G. H. G.

[6544]-Skew Bridge Construction.-A good work on above is "A Practical and Theoretical Essay on Oblique Bridges," by George Watson Buck, M. Inst. C.E., third edition, revised by his son, J. H. Watson Buck, M. Inst. C.E. (London: Crosby Lockwood and Co.) This book was spoken of in the BUILDING NEWS, Jan. 21st of the present year.—FRED. J. FREEMAN.

[6545]-Skew Bridge Construction.-"D. M. B." would do well to obtain Buck's "Oblique Bridges," published by Lockwood and Co. I know of no other practical work, or one a workman can comprehend.—G. H. G.

[6546]-Skew Bridge Construction.-I would recommend as one of the simplest which treats on this abstruse subject, Dobson's "Masonry and Stonecutting," in Weale's Series.—Hugh MacLachlan.

[6547]-Removing Whitewash.-Two processes are given in BUILDING NEWS, June 21, of this year; the second would, in all probability, be found applicable to the case in point.—Hugh MacLachlan.

[6548]-Removing Whitewash.-"Landlord" does not say whether the 18th century dwelling-house is built of brick or stone. However, try the following:—Scrub the walls with sand and water, being previously acidulated with 100 of hydrochloric acid. The common acid will do very well, and may be bought at 5d. or 6d. per lb.—FRED. J. FREEMAN.

[6549]-Restaurants.-A list would occupy too much space, restaurants and coffee-taverns being very numerous in London. Perhaps the best restaurants are those of Gatti, in Villiers-street. Strand, and in a short street at the east end of the church of St. Martin-in-the-Fields, close to the last-mentioned. More imposing restaurants are to be found in Regent-street and the neighbourhood of Golden-square. They are to be found mostly in the Strand, Regent-street, Oxford-street, and adjoining neighbourhoods, and are, as a rule, kept by Italians, Swiss, and other foreigners. Coffee-taverns will be found more at the east end of the town, at Knightsbridge, and in fact, now nearly all parts where large numbers of working men are to be found, a few even in the City. Note the cooking and bar arrangements, also the small marble tables and small compartments with other details.—Hugh MacLachlan.

[6550]-Ventilation of Soil-Pipe.-I should advise "T. P. F." to call in a practical man from a good firm of plumber's, who would, no doubt, tell him the real cause of the sewer-gas ascending the w.c.'s. Putting an "Empress" ventilating cowl on top of the air-pipe, as he proposes, would have but very little or no effect in carrying off the sewer-gas.—J. S.

[6551]-Ventilation of Soil-Pipe.-"T. P. F." might stick all the ventilating cowls in the market on top of each other upon the 2 in. ventilating pipe of his soil-pipe, and do no good to the evil he speaks of. A pan closet in many houses stinks from itself and from the inside of its own large container, independent altogether of the soil-pipe. Sometimes, when close to an outer wall, the putting in of two 1/2 in. ventilating pipes off the top of the container stops the complaint. "T. P. F." does not say if his soil-pipe is trapped and ventilated at its foot. Is such done, and how? Further, is he sure there are no holes in his soil-pipe, or that siphon action does not take place? Lastly, any ventilator which is movable, and especially with screw blades in it, upon a soil-pipe is an inferior appliance to use. It should be a fixed one, acting upon the induced current principle.—W. P. BOGANS.

[6552]-Ventilation of Soil-Pipe.-The only remedy for the bad smell of which you complain in connection with your pan w.c. is the removal of the apparatus. No amount of ventilation will cure it. A good direct-action closet, such as Phillips' sanitary or Hellyer's artisan, is the best thing to fix; but they require properly fixing and ventilating. If there is any doubt as to this, you had better fix a good Bramah pattern valve closet, which will answer very well. A cowl on top will make no difference.—DANIEL EMPELLE.

A new church of St. Mary is about to be built at Hawshaw, near Tottington, Lancashire, from the plans of Messrs. Maxwell and Tukey, of Manchester and Bury.

Dr. Frankland, of the Royal College of Chemistry, writes to the Times that he has received from H. M. consul at Jeddah, a sample of water from a sacred well of Zemzem, Mecca. Analysis proves this water, of which large quantities are sent out as gifts to all Mussulman lands, to be of the most abominably polluted character, containing no less than 570 grains of solid matter per gallon. It would, he adds, be scarcely possible to provide a more effective means for the distribution of cholera poison throughout Mohammedan countries.

Mr. Frederick Bailey has been appointed manager of the Retford gas and water undertakings, both of which belong to the Corporation, at a salary of £400 per annum.

The memorial-stone of a new wing now being added to the industrial boys' school in Marygate, York, was laid on Tuesday week. Mr. Demaine is the architect, and Mr. Dennison the contractor.

STATUES, MEMORIALS, &c.

ROTHERHAM.—A large font and canopy have just been erected in All Saints' parish-church at Rotherham, as a memorial to the late vicar, the Rev. Wm. Newton. The work has been carried out by Mr. Harry Hems, of Exeter, from the designs of Mr. J. P. Seddon, of Queen Anne's Gate, Westminster. The new font, which is placed near the south-west porch, is octagonal in plan, and is made of red Corsehill stone, quarried near Dumfries. The steps and general approaches are in the same material. The base, supporting the bowl, consists of eight detached and flying buttresses, resting upon a central support. The bowl is rich in carved work; the carving upon the old capitals in the neighbouring nave serving as suggestive types for the work. The embattlement above, all around the top of the bowl, is also similar to that upon the abaci of the capitals. The canopy is movable, and works up and down by a balancing weight. It is 12ft. high, and is of well-seasoned English oak. At each of the eight angles are chains of electro-gilt, connected with the lifting apparatus. We illustrated the design as now executed on Feb. 20, 1880, and its publication led, it may be remembered, to an animated correspondence in the *BUILDING NEWS*, it being asserted that the former black oak font of the church had been lost during Sir Gilbert Scott's restoration—a statement which proved to be unfounded. One result of the controversy was that a quaint Jacobean font-cover, which had been removed from Rotherham to the neighbouring chapel of ease at Greaseborough, was returned by the vicar of the latter parish, and now stands in the south chancel aisle. This old cover was illustrated from measured drawings by Mr. Charles Hadfield, of Sheffield, in our issue for April 9, 1880.

GOSPORT.—A monument has been erected in Haslar Cemetery, to the memory of those lost by the capsizing of the *Eurydice*, off the Isle of Wight in March, 1878. The memorial is 10ft. high, and 23ft. by 17ft. at the base. It is of novel design, representing a rough rock with seaweed thereon, and the sea pouring over it; whilst the original anchor and chain of the ill-fated ship surmount the whole. The base, which is of polished granite, and records the names of the 319 officers and men who went down, was prepared by the convicts at Chatham, while the superstructure was prepared by the convicts at Portland, with stone from the neighbouring quarries. The memorial was designed by Colonel Pasley, C.B., Royal Engineers, Director of Works, and it has been erected by the Works Department of the Navy.

On Wednesday week, Mr. Robert Morgan, C.E., one of the inspectors of the Local Government Board, held an inquiry at Penistone into an application for the local board to borrow further moneys for works of water-supply. The board has been constructing works of water-supply at Hornthwaite Bank, in Thurlstone, the water to be obtained from a deep well by pumping. The original estimate was for £5,000, and another £2,500 had been granted; and this was an application for a further sum of £2,500, making £10,000 in all. In almost every item of the last estimate a considerable excess of expenditure had been incurred; and one of the members of the local board asserted that economy had not been used, that money had been wasted, that the engineer had been dismissed, and that the work was now being carried on under the supervision of the waterworks committee and a clerk of the works, who knew nothing of the work, and were not competent to carry it out. The chairman of the local board defended the board's action, stating that the engineer had caused them great expense by his bad advice, and that the board had acted wisely in getting rid of him.

Great progress is being made with the large fort which is being constructed at Borsal, near Rochester, for the defence of Chatham Garrison and the Dockyard. The whole of the labour is being carried out by convicts, some 600 or 700 being daily employed upon it. Another fort, the ground for which has been laid out, will be constructed on the Maidstone-road, about five miles from Chatham; whilst a third will be constructed on the Canterbury-road, about four miles from Chatham. The convicts who have been employed in carrying out the extension of Chatham Dockyard are being drafted for work at Borsal, for as the Dockyard extension approaches completion there is not work for so many men as formerly, as many as 1,700 convicts having at one time been employed upon the extension works.

An observatory of iron is to be erected at Boston, which will, it is stated, be the highest building in the United States. The shaft is to be cruciform on plan, with a well 3ft. square in the centre. The "column" will be secured by "guys" of steel wire, and a couple of cars will be provided for elevating visitors to the galleries, whence they will "observe" the surrounding country.

STAINED GLASS.

HALIFAX.—**MILITARY MEMORIAL.**—A two-light stained-glass window has been erected in the north aisle of the old parish-church of Halifax by the officers of the 33rd (Duke of Wellington's) Regiment, as a memorial to four of its late officers deceased during service—viz., Major A. J. Weeding, Captain E. S. Wason, Lieutenant R. S. P. Robinson, and Second Lieutenant J. B. H. Carmichael, the two last having been victims of the landslide at Naini Tal, India, Sept. 18, 1880. The subjects (from Acts x.) are—1. The "Angel Appearing to Cornelius," with legend, "Thy prayers and thine alms are come up for a memorial before God." 2. "Peter Visiting and Raising the Kneeling Cornelius"; legend, "But Peter took him up saying, 'Stand up. I myself also am a man.'" As Cornelius was a Centurion the selection is evidently intended to vindicate the consistency of a religious spirit with military service. Each subject-group is surrounded by a canopy. The colouring and ornamentation, though effective, pure and but moderately rich, the enframing window and tracery being of severe 15th-century style. In the bases of the lights are respectively the crests of the Duke of Wellington and of the regiment. A surrounding riband bears the names of the battles inscribed on the regimental flag. The window, by Messrs. Powell Bros., Leeds, was erected under the superintendence of Mr. Jackson, architect, Halifax.

WATER SUPPLY AND SANITARY MATTERS.

THE UPPER INNY DRAINAGE WORKS.—The Commissioners for Public Works in Ireland have just issued their consolidated award with reference to the repayment of the loan obtained from Government for these extensive works. More than 11,000 acres are included in the award as having been saved from the injurious effects of flood waters, but the area actually benefitted is far larger than this. The works, which extend along 80 miles of rivers and tributaries, passing through four counties, are the largest yet completed under the Drainage Act of 1863, and have included the erection of many bridges of large span, and of weirs and sluices, together with two very large self-acting regulating weirs. The works were designed by and carried out under the direction of the chief engineer, Mr. James Dillon, M.I.C.E., of London and Dublin.

The Middlesbrough and Stockton water board proceeded on Monday to elect a general manager for their waterworks, at a salary of £500 a year. 119 applications had been received in reply to the advertisement, many of the candidates having had extended experience in connection with waterworks. Notwithstanding some protests, the board, by seven votes to two, appointed Mr. D. D. Wilson, of Middlesbrough, a late member of the board, to the office. Mr. Wilson, who was unsparing in his criticisms on expenditure when he sat at the table of the board, is, no doubt, absolutely the best qualified man that could have been selected for the post; but, that being so, it appears somewhat unnecessary for the board to have invited strangers to send in their testimonials and applications.

The church of St. James, New Mills, Derbyshire, erected about three years since, was, after undergoing decoration to internal walls and roof, reopened for service on Sunday last. A novel detail is the introduction, within four pointed-arch wall recesses in the nave, of as many groups of spirit fresco painted figures, embracing the subjects of Christ Blessing Little Children, the Sermon on the Mount, Feeding the Five Thousand, and the Final Commission to the Apostles, with suitable text legends beneath. These groups are in dark outline, relieved by a dull Indian red background, with here and there a little gold. In the ornamented bases are emblems of the Four Evangelists. These recessed frescoes are, in their individual entirety, further relieved by the diapered vellum-tinted walls, rising above dado of two shades of deep red, which surround them. The artists, and of the whole decorations, are Messrs. Powell Bros. (Leeds), Mr. W. Swinfen Barber, of Halifax, being the supervising architect.

A stained window has just been placed in the north transept of Wistanstow Church, Salop, in memory of members of the Hoggins family. The subject chosen is "The Ascension." The stonework of the window is of the Early Decorated style, with three lights, and trefoils in the head. In the centre light the figure of Our Lord appears ascending, surrounded by a halo of light, while two disciples kneel beneath. In the two side lights other disciples are seen in postures of adoration. In the head of the window are angels and the figure of a dove descending, the background being pale blue studded with stars. It has been executed by Mr. John Davies, of the Wyle-coop, Shrewsbury.

LEGAL INTELLIGENCE.

DANGEROUS STRUCTURES.—At Marlborough-street on Sept. 7th application was made to Mr. Newton by Mr. H. W. Napier, representing the Metropolitan Board of Works, for the removal of the inmates of No. 30, St. Martin's-court, on the Salisbury estate, which had already been partly pulled down as dangerous by the Board's contractor on the magistrate's order. The district surveyor (Mr. R. Walker) proved the dangerous condition of the property, the back wall of the house having been pulled down. A woman—one of the occupiers—attended to defend the case, and said, her rent having been demanded, she had paid it up to the 29th of September, and she produced her rentbook to show the fact. Mr. Newton expressed his sympathy with her, but told her that it would be better for her to remove than possibly to be buried in the ruins, and he hoped she would tell the other inmates of the house what he had said. The order asked for was made.

IN RE A. M. COHEN.—Bankruptcy Court, Sept. 13th, before Mr. Registrar Brougham.—This was a first meeting. The bankrupt was a builder, carrying on business in Portsdown-road, Maida-vale. He had filed a petition for liquidation, but the proceedings became abortive, and an adjudication was recently made. The statutory accounts were not filed, but proofs of debt for about £700 were admitted, and the creditors appointed Mr. Solomon Barnett, of Brondesbury-road, Kilburn, builder, to the office of trustee, together with a committee of inspection.

CHIPS.

Mr. Arnold Taylor, an inspector from the Local Government Board, held an inquiry on the 7th inst., at Ovenden, as to an application to borrow £1,200 for street purposes by the local board, £300 being required for widening Holdsworth-lane and £900 for making a new road from Shay-lane to Moorside, through land belonging to the Ovenden Worsted Company.

The Smack-boys' home, at Ramsgate, was opened on Tuesday week by the Marchioness Conyngham. Mr. A. R. Pite, of Bloomsbury-square, is the architect, and Mr. W. Martin, of Ramsgate, the builder. The cost has been £2,000.

It has been decided to complete the façade of St. Petronis, the principal church in Bologna. The plans of a young architect, Signor Guiseppe Ceri, have been adopted, and appeals have been scattered by the committee broadcast for the required funds, about £50,000.

The directors of the Warwick and Leamington Tramway Company have entered into a contract with Mr. John Fell to lay their lines for £14,800, and the working of the line is expected to commence in October.

A new Primitive Methodist chapel is to be erected at Walbottle. Mr. T. Southron, of King-street, South Shields, is the architect.

Messrs. Bedford, of Phoenix Mills, Boston and Sleaford, have been making large additions to their Boston Mill, more than doubling the size, and adding new machinery to their plant. Mr. W. M. Cooper, corn merchant, has also been building a second large granary, and close to the railway at Boston. Both works have been carried out by Mr. John Lucas, builder, of Boston, and on Saturday week the men employed on the two buildings supped together at the Guildhall.

The tenth annual exhibition of the Kirkcaldy Fine Art Association was opened on the 8th inst. by the Earl of Glasgow.

The Stockbridge local board, last week, adopted a scheme by Mr. Crowther, their engineer, for the extension of the waterworks.

It is proposed to construct a new railway from Sheffield through Newark and Sleaford to Boston, joining the L. and N. W. system at Newark, and the Great Eastern at Boston. Mr. Parry is the engineer.

The foundation-stone of a new church of St. Peter was laid at Sicklinghall, near Weatherby, Yorks, on Monday. It will seat 150 persons, and will cost £800. Mr. Parkinson is the architect.

The Skipton rural sanitary authority, on Saturday, elected Mr. John Varley, builder, Gargrove, as clerk of works, to superintend the carrying out of the Gargrove water scheme, under Mr. E. Filler, C.E., the engineer in charge. There were 76 applicants for the post.

New schools attached to the Roman Catholic Mission of Our Lady of Mount Carmel, Corby, have been opened. The architects are Messrs. Goldie and Child, of London, and the builders, Messrs. Story and Son, of Swinstead.

The foundation-stone of the new Free Library and School of Art at Newport, Mon., was laid on Tuesday by the mayor of that borough.

Our Office Table.

WE record with regret the death of Mr. Thomas Jeckell, of St. George's-terrace, Queen's gate, Kensington. He was certainly an architect of considerable ability, and perhaps better known for his admirable skill in designing both wrought and cast ironwork. Messrs. Barnard, Bishop and Barnard's well-known slow-combustion grate-fronts were designed by Mr. Jeckell, and for many years he was extensively engaged by the same firm in working out ornamental ironwork designs of all kinds and of every degree of richness. Usually, a thoroughly Japanese-like character is noticeable in the decorative forms employed in Mr. Jeckell's work, which had a manner peculiarly its own. He was among the first English artists who grasped the spirit of that style and turned his knowledge to a practical account. Among the more recent of his designs we may name the costly and richly-detailed wrought-iron pavilion, executed by Messrs. Barnard, Bishop and Barnard, at Paris, for the International Exposition in 1878, which has recently been permanently erected in the Chapel-field, Norwich. Some of the cast-work consoles or trusses to this structure are perhaps equal to anything of the kind that we have seen; notably so for giving figure-subjects in low relief at once adapted to the material used. For some time the deceased had suffered from a mental derangement, and he died at Norwich on the 30th of last month, at the comparatively early age of 54 years.

A NEW town-hall is about to be erected at Cork; but from a report just sent us of the Town Council meeting, there is some disagreement among the members about the advisability of such a project. "Let us improve and purify the back lanes of the city first, and beautify it afterwards," was the not un sensible remark of one member, provided, of course, that the very desirable sanitary work here referred to be carried out. Mr. John L. Robinson, of Dublin, had prepared plans, but the mayor said the designs would cost them nothing, as their author had sent them unsolicited and free of charge. Some correspondents have written us in consequence on the subject, objecting to the reported action of Mr. Robinson, who, it will be remembered, was the architect of the Kingston town hall, illustrated by us some time ago; and we are requested to expose and condemn such unprofessional practice. There are, however, always two sides to every question, and, in this instance, we have only one account of the story before us. Architects are often asked by private members of public bodies to furnish designs informally, specially when the building contemplated is only the scheme of a section rather than the project of the whole body, and it appears that a request of this kind was made in the present instance, the list of required offices being furnished by the City Engineer, and the two sites proposed for the contemplated building being shown at the same time. Anyway, we read that Mr. Robinson has received the official vote of thanks from the Cork town council for the trouble he had taken in the matter, and "for his very admirable sketch."

THE largest stone slab ever quarried in the United States has recently been placed before the new residence of Mr. W. H. Vanderbilt, on Fifth-avenue, New York City. The stone measures 25ft. 2in. by 15ft., and is 8in. thick. It weighs about 41,000 pounds. It was quarried at Barreville, Sullivan county, N. Y., and the block from which it was cut is described as perfectly level, and about 90ft. long and 19ft. in width. From this surface the block was cut out and then raised by wedges. In this instance the seam was so open that the stone was raised without difficulty, and what was unusually gratifying to the contractors was the perfectly clean and level bed below, which required comparatively little dressing. The block could have been made 35ft. in length, but the great weight would have made its transportation very risky. As it was, a great deal of difficulty was met in bringing it to New York.

MR. J. KENWARD, F.S.A., announces that in cutting a drain through a carriage-drive, in Park-lane, Harborne, near Birmingham, he has discovered a cylindrical well dating from the

Roman occupation of Mid-England, and not later, therefore, than the fourth or fifth century. It is about 4ft. in diameter and 20ft. in depth, constructed of large blocks of local sandstone, solidly put together with breaking joints and bonding tile; the mortar is compounded of lime, pounded tile and gravel. The well, Mr. Kenward adds, is exactly of the Vitruvian type, occurring in other districts, such as at Stanwicks (Abballaba) and Housesteads (Bor-covicus) on the Ficts' Wall, where the diameter is also between 3 and 4ft., while the material is freestone in large blocks. No coins, pottery, or other relics have as yet been found in or near the well, of which no record exists. The site is about one mile west of the Icknield-street, where it skirted Harborne in its way from Droitwich (Salinis or Saline) to Wall (Eto-cetum), and it is at about the same distance from the remarkable camp which, if not made by the Romans, was occupied by them in Metchley Park. The old well will be retained, if not in an open, at least in an accessible condition, as a memorial of good Roman work in a district of the Flavia Cæsariensis which has very little of that era to show.

THE *Salisbury Journal* asserts that steps have already been taken, doubtless under the sanction of Sir Edmund Antrobus, towards the "restoration" of Stonehenge. "The only remaining outer trilithon on the north-eastern side of the rings has been bolstered up by means of a gallow-like wooden erection, very similar in construction to that which supported Temple Bar during the last month of its existence. This is placed transversely beneath the upper stone; and, as it is of a very substantial nature, it completely destroys the picturesque effect of that side of the ruin. The huge pillar which inclines inwards on the south-western side will, presumably, be next taken in hand; for, since the work has been commenced, it is but natural to suppose that it will be completed, and that all the stones will ere long be safely buttressed by a number of unsightly props and scaffoldings." Mr. William Cunningham, F.S.A., now residing at Clapham, S.W., but well-known in connection with excavations into "pre-historic" mounds in Wilts and Berks, writes to say that this is a complete misapprehension of the works at Stonehenge. Sir E. Antrobus, the owner, is, Mr. Cunningham explains, "about to replace in an upright position two of the stones of the outer circle, with their impost, which are now in much danger of falling, to the great peril of visitors. There is no fear that anything will be done to injure the building or to mar its picturesque appearance. At the same time, it is to be hoped that, as much of the earth will necessarily be moved, the opportunity will not be lost to search for fragments of the old rocks, and to elicit any facts connected with the building."

MR. JAMES LOVEGROVE, surveyor to the Hackney District Board of Works, has just published his annual report of the works carried out in the twelvemonths ended March 31st last. Building operations have, he says, increased, and gone on far beyond what was anticipated at the commencement of 1880. Three miles, 1,000 yards of new streets, 23 in number, were approved by the Board, and are estimated to have cost over £23,400. The hard core sifted from dust-bin rubbish is unsightly, but it forms, in the author's opinion, one of the best available materials for the formation of new roads, while its use keeps down the cost of dust-collection. Of new sewers 2,378ft. of 3ft. by 2ft. brickwork have been laid, as well as 864ft. of 15in. pipes, 2,810ft. of 15in., and 4,230ft. of 12in. The Metropolitan Board of Works have resolved to construct a new storm overflow sewer, to commence from the River Thames in the neighbourhood of Ratcliff Cross, to connect with the Great Northern High Level Sewer in Mare-street, opposite the Anhurst road. Suggestions are made by which Mr. Lovegrove thinks the extent of floods could be considerably reduced, by passing the water into the River Lea and the old river. During the year the North Metropolitan tramway system has been extended from Stamford-hill to Edmonton. A large amount of asphalt foot-paving has been laid, principally by the Stiebel, the Limmer, and the French asphalt companies.

NO 1, STANHOPE-PLACE, W., is being decorated by Messrs. Holland and Sons, of Mount-street, Grosvenor-square. We have seen the admirably-

executed and handsome satinwood mantelpieces just completed, with ebony and walnut inlay work, the ornamentation being executed chiefly in carved boxwood, with quiet and good effect. The sculptured frieze panel of boy figures is exceptionally pretty. Large oval silvered glasses, inclosed with fluted double pilasters and pedimented cornice over, occupy the entire width of the chimney-pieces, and are in harmony with the style chosen. Used together, these two fireplaces will thus give an air of size and brightness to the drawing-room, for which they are intended. The brass basket-grates are handsome pieces of work, though, perhaps, scarcely elaborate enough in detail for so richly treated an apartment. The general walls are divided out by pilasters tinted in quiet warm colour, and a series of panels with dado and light frieze are thus formed.

"To Builders' Men," is the title of a characteristic letter which has just been printed by the Rev. J. W. Horsley, the well-known chaplain of H. M. Prison, Clerkenwell. The writer evidently has had no little experience of the class he addresses, while his knowledge of human character has enabled him, in a few pointed words, which are both well-timed and chosen, to give some home-thrusts in a manly and honest style. There is no cant about his letter, and it may, with profit, be read by thousands of whatever creed, or even by those who have none. "Let us be men," writes the author. "Build up a tower of manly life," to quote the words of Tennyson, "four square to all the winds that blow," "laying well the foundations of Prudence, Justice, Temperance, and Fortitude." These are the virtues selected by Solomon, the great Temple builder, and by Socrates, as the basis of all good honest work, and Mr. Horsley has done well in thus practically enlarging upon them in language specially adapted "to Builders' Men."

At the end of 1879 Victoria possessed 1,125 miles of railway; New South Wales, 736; South Australia, 559; Queensland, 503; and Western Australia, 72. In all the three first mentioned, considerable additions have been made since the commencement of 1880, and New South Wales and Queensland are both pressing for great trans-continental lines. Both countries propose to construct these and other lines for opening up the country by land grants to capitalists who will undertake the work. For similar purposes New South Wales has already alienated 16,357,000 acres of land out of a total of 208,000,000, leaving 191,643,000 still unalienated. Queensland contains 428,492,800 acres. Of this, 3,442,389 acres have been alienated, and taking the estimated capital required for the new railways at £4,000,000, and reckoning the land worth 6s. 8d. per acre all round, 12,000,000 acres would have to be alienated to construct the line, leaving about 199,000,000 acres untouched. The chief railways proposed are a trans-continental line from Roma to Point Parke in the Gulf of Carpentaria, and a grand trunk line to New South Wales.

THE annual value of property charged with the inhabited house-duty in Great Britain is now estimated at upwards of fifty-five millions sterling, the duty on which the last official year of the returns amounts to £1,815,170. These figures, however, are far from indicating the total value of houses and buildings, since the houses not liable to duty by reason of their low rental, or from their not being used as dwelling-houses, together with hospitals, schools, work-houses, Royal palaces, and houses occupied by foreign ambassadors, which are also exempt, are estimated at over fifty-seven millions; or more than half the entire value of our house-property.

THE following report from Mr. Wilson, head gardener to the Manchester Corporation, will be of service to those charged with planting trees in or near great towns:—"The planting has been done at two periods—March, 1879, and March, 1880. At the second period the poplar, ash, and thorn only were planted, this kind having been the most successful in 1879. The trees were specially selected and well rooted. At the Infirmary 117 poplar, ash, and thorn were planted, and the number dead up to the present time is 19. At All Saints 227 trees—ash, lime, poplar, and sycamore—were planted, and 87 were now dead. In St. George's Churchyard 234—ash, poplar, thorn, willow, and shrubs of alder and

privet—were planted, and 75 are now dead. It thus appears that out of 578 trees, 203 are now dead. Since the trees have been planted they have had my constant supervision, and all possible means have been taken with a view to their preservation. I may say that the sort of trees appearing to thrive the best were the common ash, Ontario poplar, and the plum-leaved thorn, but I am of opinion that until our atmosphere can be relieved from the noxious gases now existing, tree-planting in Manchester will be very unsatisfactory, if not a failure."

THE Court of Quarter Sessions for Kent have drawn up the following regulations, with the view of insuring protection against fire at places which shall henceforward be licensed for music and dancing, or music only, in Kent, outside the jurisdiction of the Metropolitan Board of Works:—All doors and barriers to open inwards; all gangways, passages, and staircases intended for the exit of the audience to be kept free from chairs and other obstructions, whether permanent or temporary; an ample supply of water, with proper appliances for extinguishing fire, to be provided on the premises; all fixed and ordinary gas-burners to be furnished with guards; no white-metal gaspips to be used. The report of the county surveyor, or other person accredited by the Court, that the above rules have been complied with must be produced, and no structural alterations made without the sanction in writing of the justices of the petty sessional division in which the building is situated.

THE Trade Union Congress is being held this week in St. Andrew's Hall, Newman-street, London, W. The business was opened on Monday by an address from Mr. Crawford, of the Durham Miners' Association, in which the principal topic was the attitude which trade unions should take up in order to influence legislation. Mr. Edward Coulson, secretary of the Operative Bricklayers' Society, was elected president for the year, and delivered on Tuesday his inaugural address, in the course of which he remarked that the trades unionists were not willing to tolerate any reverting to the old nonsense of protection—a remark which was greeted by prolonged cheers. He recommended the Congress to concentrate its strength on advocating the abolition of the law of conspiracy. The Congress discussed the Employers' Liability Act, and passed a resolution instructing the Parliamentary Committee to take steps for procuring the amendment of the Act, in order to remove from it the power of parties to contract themselves out of the Act. At Wednesday's sitting a variety of subjects were discussed, including the administration of justice at petty sessions and the immediate codification of the criminal law. Mr. Inderwick, Q.C., M.P., addressed the Congress upon the last-named subject, and Professor Beesley upon the law of conspiracy. A somewhat excited discussion occurred in the afternoon in connection with the credentials of the delegates. In the evening the Lord Mayor and Lady Mayoress received the delegates and their wives at the Mansion House.

MR. THOMAS BRADLEY, of New York city, has patented an improved machine for sweeping streets, gathering the sweepings, and delivering the material gathered to carts at one operation. The object of this invention is to save the use of horses and men, especially for the sweeping machine, by furnishing a machine adapted for attachment behind the carts used to convey away the sweepings, so that the sweeper can be attached, drawn along, and, when the cart is filled, the machine disconnected and left for the next cart.

ABOUT eighty applications from various parts of the country have been sent for the vacant office of Borough Engineer and Surveyor for Leeds, the salary offered for which is £600 per annum. The applications were considered on Tuesday by the Special Committee appointed for this purpose by the Town Council, and the following were selected for final choice, viz.:—Mr. James Jowett, Manchester, district engineer and surveyor; Mr. R. L. Mestayer, Salford, deputy borough engineer; Mr. J. Cartwright, Bury, Lancashire, borough engineer; Mr. W. J. Morley, Bradford, architect and surveyor; Mr. Thos. Hewson, Rochdale, borough surveyor; Mr. Garrett J. Barry, Liverpool, engineer.

THE Rev. Robert W. Eyton, the distinguished

antiquary, and author of "The Antiquities of Shropshire" and other works, who died last week at Winchfield House, Hants, was the son of the Rev. John Eyton, vicar of Wellington and Eyton, Salop, by his marriage with Anna Maria, only child of Edmund Ploeden, of Ploeden, Salop, and was born December 21, 1815. He was educated at Rugby and at Christ Church, Oxford, where he obtained a second class in classics and graduated in 1839. He was rector of Ryton, Salop, from 1841 to 1863, during which time he composed his great work, "The Antiquities of Shropshire." The minuteness and extent of his researches into the history of his native county will be appreciated when it is stated that, although he has not carried his history further down than the reign of Edward I., the work extends over 12 volumes. Unlike most county histories, which deal almost entirely with genealogical and local questions, Mr. Eyton's work is a valuable contribution to the history of the feudal and judicial systems of the country for the first two centuries following the Norman Conquest. Mr. Eyton was also the author of "Digests of the Domesday of Dorset, Somerset, and Staffordshire," and of the "Itinerary of King Henry II." His latest work has been the editing of the "Pipe Rolls" and early charters of Staffordshire for the William Salt Archaeological Society. In Mr. Eyton, says the *Times*, the country has lost an antiquary who for accuracy and fulness of research could hardly be surpassed.

WE have had sent to us by Mr. Alfred Widcomb, of Thorougham House, Gloucestershire, a photograph of an interesting carved oak mantelpiece at that old house, from York-place, the palace of Cardinal Wolsey till his disgrace and fall in 1529. It is said to have been given by Henry VIII. to Abbot Parker, the last mitred abbot of Gloucester. The mantelpiece is divided into three oval medallions or panels, each having a carved subject. The shell carving at the top and bottom of the panels, and especially the figures, faces and draperies, are carved with wonderful expression. This work is supposed to have been done at Rome about 1520, though from the style we should think it is later.

CHIPS.

The local board of Widnes, having considered alternative schemes of sewerage, prepared by Major Cross, C.E., and by their surveyor, Mr. J. T. Higginson, have adopted the former plan. The estimated cost is about £38,000.

Extensive linendraper's and house-finisher's premises in Wine-street, Bristol, were reopened on Monday, after rebuilding. The work has been carried out from designs of Messrs. Fripp and Saunders, of Exchange Buildings, Bristol, and has involved the destruction of a carved 14th-century wooden gateway leading into Guard House-passage. Messrs. Cowlin and Sons were the builders, and Messrs. Colley and Son executed the carving.

M. Gambetta, and M. Tirard, the minister of Commerce, were present on Tuesday week at Honfleur at the ceremony of opening sluices that had been constructed in order that the outflow of water might deepen the harbour, which is threatened with being silted up with sand. The experiment was completely successful, and it is believed that the harbour was deepened by 10 to 12 ft.

On Tuesday week an additional line, constructed by the directors of the Great Western Railway, in order to accommodate their increasing suburban traffic, was opened between Uxbridge and West Drayton, under the supervision of Mr. A. Higgins, divisional superintendent of the London district.

Tickhill Church has just undergone extensive restoration under the direction of Mr. J. D. Webster, architect, of Sheffield. The chancel, nave, and south aisle have been freshly roofed, and the parapets to the nave and chancel, which were in a very dangerous condition, have been taken down and re-set. An oak reredos, manufactured by Messrs. Dutton and Evans, from designs by Mr. Webster, has been placed in the church, and a new method of heating has been adopted. Owing to want of funds, the restoration of the north aisle has been left to a future occasion.

It has been proposed to hold an international exhibition at Manchester next year, the profits to be applied to the establishment of a local museum on the South Kensington model.

At the last meeting of the town council of Lincoln, some discussion arose as to the proposed size

of the ventilation shafts, several members contending that 4 in., as specified by Mr. Mansergh, was extravagantly large. The Mayor said the Special Sewerage Committee thought the ventilating shafts very large, but the Local Government Board would sanction nothing less, and so it was not in their power to allow a smaller pipe to be used. In answer to a question as to whether 4 in. ventilating pipes had been used in other places, it was explained that the idea was a very recent one, being only about four years old.

The will of Mr. John Collier, late of Wychwood Lodge, Putney, architect, who died on June 3rd last, was proved on the 29th ult. The personal estate amounts to over £9,000.

At the last meeting of the Tunbridge Wells local board two tenders, amounting together to £21,944 1s., were accepted for the construction and asphaltting of the water storage reservoir, out of thirty received, and Mr. Peter Todd was appointed assistant surveyor.

The death occurred last week, at Cheshunt, of Mr. Frank Shaw, articled pupil to Mr. F. Chambers, architect, of Queen-street-place, E.C. Deceased was a youth of considerable promise and ability.

Mr. C. L. Eastlake, keeper of the National Gallery, and for some years secretary of the R.I.B.A., is preparing to publish a series of illustrated volumes designed as guides to the great Continental picture-galleries.

The heritors of Dailly, Ayrshire, have resolved to erect a new parish-church, the present one being old and inadequate. Messrs. Wardrop and Reid, Edinburgh, are to be the architects.

Extensive alterations have been made to the workhouse at Rogby, and are now almost completed. Mr. Manning is the architect, and Mr. Coleman the contractor.

The former residence and counting-house of the great family of the De la Poles, the original founders of the House of Suffolk, situated on the east side of High-street, Hull, opposite Blackfriargate, so long familiar by the ancient, grim-looking figures affixed to its exterior, has just been demolished, and is to be replaced by a building to be erected from the designs of Messrs. Smith and Brodick, of Hull. Two marble statues, by W. Keyworth, jun., to the memory of William and Michael De la Pole, have recently been placed in the entrance-hall of the Hull Town Hall.

The Edinburgh and District water trustees, on the 8th inst., appointed Mr. Alexander Jarvis as inspector of the works now in progress at Rosebery reservoir, from the plans of Messrs. J. and A. Leslie, of Edinburgh, engineers to the trust; the salary is at the rate of £250 a year.

Mr. John Studd, architect and surveyor, late of Hong-Kong, died very suddenly when at South-sea, on the 7th inst. Deceased was in his forty-eighth year.

The German Sanitary Congress was opened at Vienna on Tuesday.

A new Primitive Methodist school is about to be erected at Wingate, Co. Durham, from plans by Mr. Joseph Shields, architect, of Durham city.

St. Saviour's Church, Falkner-street, Liverpool, was reopened on Sunday after renovation effected under the supervision of Mr. Hartley, architect, of Lord-street, Liverpool. The contract for painting and decorating was carried out by Messrs. Hensham and Son, of the same city. The cost of the work has been £400.

An infectious hospital is approaching completion at Sittingbourne, and is being roofed in this week. Mr. W. L. Grant is the architect, and Mr. W. J. Beaumont the contractor.

A Local Government Board inquiry was held at Skipton on Friday before Mr. J. T. Harrison, C.E. inspector, into an application from the local board for sanction to borrow £1,726 15s. for street improvements and extras incurred on the sewage farm.

A trade and mining school is about to be built in Unity-street, Bristol. A local newspaper states that the first premium in the recent competition was awarded by the Merchant Venturers to Mr. Stuart Colman, of Bristol, but that the school will, however, be built from the plans of Mr. Robins, of London.

A stone coffin, 6 ft. 6 in. in length and a foot in depth, was found on Wednesday week during some excavations at Ipswich in Messrs. E. F. and F. Turner's ironworks, which adjoin St. Peter's churchyard, and occupy part of the site of the college founded by Cardinal Wolsey, and previously occupied by the priory of SS. Peter and Paul. The coffin, which contained crumbling human remains, was placed with head to west and had no lid, so that no clue exists to the identity of the remains. The coffin has been placed in the recently opened museum in High-street.

The corner-stones of a new church to be erected in Lawkholme-lane, Kighley, were laid on Saturday week. The architect has adopted the Early English style of architecture. The church will seat 730 people, and the cost of the nave, aisles, and transepts—all that is being built at present—and the boundary walls will be about £3,000. Mr. J. B. Bailey, of Kighley, is the architect.

Extensive works of sewerage are about to be carried out by the Altrincham Local Board of Health, from the plans of Mr. John Stokoe, their surveyor.

The water was admitted on Friday to the wet dock at B'n-ss on the Forth, which has been in course of construction for three years, and is 7½ acres in extent. The sluice was turned on by Mr. Jopling, resident engineer, and Mr. Houston, contractors' engineer. Messrs. Thom, Meik and Son, Edinburgh, are the engineers in chief. The cost of the work has been about £180,000.

Doddridge Chapel, Northampton, was reopened last week, after the completion of extensive internal alterations and improvements. Messrs. Woodford and Sons, of Bath-street, Northampton, were the contractors.

Two fountains are in course of construction in the circular well lights at the east and west ends of the market roof in the Waverley-gardens, Edinburgh. The work is being carried out by Mr. Morham.

A memorial font was placed on Monday in the parish-church of Aston, near Birmingham. It was designed by Mr. Chatton, architect of the church restoration, and carved by Mr. John Roddis, of Aston.

Mr. Gilbert R. Redgrave has been appointed secretary of the Royal Commission on Technical Education; the first meeting was held on Tuesday at South Kensington Museum.

Mr. Thomas Fraser, borough engineer of Edinburgh, who has been in the service of the town council over 26 years, resigned office on Wednesday on the ground of failing health. The town council, while accepting the resignation, appointed Mr. Fraser as consulting engineer at a salary of £200 per annum.

An organ-screen is being erected in Eton College chapel, as a memorial of the Etonians slain in the recent campaigns.

The foundation-stone of the new grammar-school at Carlisle was laid on the 6th inst. by the Duke of Devonshire. The architect of the building is Mr. Geo. D. Oliver, of the firm of Hetherington and Oliver, whose design was recently selected in competition. The contractors are Messrs. Beay Bros. for brickwork and masonry; and Messrs. H. and R. Court for carpenter and joiners' work. The total cost will be upwards of £10,000.

Mr. J. F. Tunc, C.E., died on Tuesday week, at his residence in West Jesmond, Newcastle. He was engineer to the Blyth and Tyne Railway before its amalgamation with the North Eastern Railway Company; and, associated with the late Mr. Joseph Laycock, he surveyed and superintended the construction of the several lines in connection with the smaller undertakings. He also performed a similar duty in the case of the Border Counties line, previous to its absorption by the North British system.

An inquiry was held at Warwick on Friday, before Mr. J. Thornhill Harrison, C.E., on behalf of the Local Government Board, respecting an application to borrow £1,000 for sewerage works in West-street. Mr. Broughton, borough surveyor, explained the scheme, which was approved by the inspector.

The Queen has presented a stained-glass window to St. Mary's Church, at Bury St. Edmunds, to the memory of Mary Tudor, daughter of Henry VII., often called "Mary, the French Queen," as she married first Louis XII. of France, and afterwards Brandon Duke of Suffolk.

The commission for piercing Mont Blanc is said to be of opinion that, with a sum of 100 million francs, the boring of the tunnel and the hues of access could be made. The engineers, Lepinay and Gault, show that it is possible to arrive at Ivrea as south exit, and at Bonneville as north entrance, with out serious difficulties.

At a meeting held at Brighton town-hall on Monday it was decided to hold in that town, in December next, a domestic sanitary and scientific exhibition, including foods, their economic preparation and use, with cooking and other apparatus. A competitive exhibition of the electric light is also contemplated.

The memorial-stone of a new Congregational Church at Rutherglen, Glasgow, was laid on Saturday. Mr. Matters is the contractor.

An important work in tiling at the School-board offices, Leeds, costing over £1,000, has just been completed by Webb's Worcester Tiles Company, Limited, Worcester.

Tenders were opened on Friday for the erection of the Gibson Memorial Hospital at St. Andrew's, N.B. By the trust disposition and settlement the amount to be expended in buildings and furnishings was restricted to £1,000, and it was found that the gross amount of the estimates for the building was £3,200, leaving a margin of £200 for extras and furnishings. It was resolved forthwith to proceed with the erection of the hospital. The architects are Messrs. Hall and Hendry.

Mr. Thomas Wait, builder, of Peasmarsh, near Rye, an elderly man, went to the village public-house on Saturday evening to cash a cheque. On his return home he was waylaid by some hooligans and so brutally assaulted that he died in a quarter of an hour.

A medal has been gained at the Sanitary Exhibition, Eastbourne, by Mr. Henry Chalk Webb, of Worcester, for his new diachromatised wood pavements. The peculiarity of this invention is that the pattern, in any number of colours, is perfect through the wood blocks, 1½ in. thick. A special medal has also been awarded this invention by the Sanitary Institute of Great Britain.

The galleries of the Royal Academy, Burlington House, are now being redecorated by Messrs. Holland and Sons, under the directions and from the designs of the Royal Academy Surveyor, Mr. R. Phene Spiers, F.R.S.B.A. The cornice is to be ornamented in its frieze with stencilled patterns, rather Arabesque in character. The general wall-colours, we believe, will be carried out as before.

St. Luke's Church, Sheffield, was reopened on Sunday, after a thorough restoration and redecoration; also the addition of a stained-glass window, by Mr. A. Gibbs, of London, in chancel; the subject being a "Jesse window." The reredos immediately below is decorated with the emblems of the Four Evangelists, and two panels on either side being filled with the passion-flower, wheat, vine, and lily. The other portions of the church are decorated with diapers, texts, emblems, &c. The architect was Mr. H. D. Lomas, of Sheffield. The decorations were executed by Messrs. Johnson and Appleyards, of the same town, from designs of their artist, Mr. E. Baillie Smith.

At the half-yearly meeting of the Leominster and Bromyard Railway Company, the engineer, Mr. William Clark, C.E., of Westminster, reported that the line would be completed from Leominster to Steens-bridge by the end of the present year. The contract for the last section, that from Steens-bridge to Bromyard, has not yet been let.

A new mission church in connection with the parish of St. Michael's, Hulme, Manchester, which has been erected at the junction of Victoria street and Tomlinson-street, Stretford New Road, was opened on Sunday. The structure has cost £2,200. It is of simple Domestic Gothic architecture, containing chancel, vestry, organ-chamber, and classrooms. Provision has been made for 300 sittings. The warming and ventilating apparatus were supplied by Mr. E. H. Sherland, of Manchester.

A statue was inaugurated at Boulogne-sur-Mer, on Monday, to Frédéric Sauvage, to whom is attributed the invention of the screw propeller. The statue has been erected facing the bridge leading from Capcécure, and in front of the Hotel Christol, and is of bronze; it represents him in a standing attitude, with one hand resting on a screw-boat.

The Walsall town council have agreed to purchase Reed's Wood, within one mile of the bridge, and containing 46 acres, offered by Earl Bradford, at the nominal sum of £1,200, of which £880 is expected to be recouped by the sale of a portion. The cost of inclosure and laying out is expected to bring the outlay to about £7,000.

At St. Michael's Church, Maidstone, the small windows of the baptistery have just been filled in with the baptismal types of the Old Testament, and three other windows are now in course of preparation, viz., one for the south of the chancel, to represent St. Michael the Archangel, which is being prepared by Messrs. Heaton, Butler, and Bayne; and two for the south aisle, to illustrate the expulsion of Adam and Eve from the garden of Eden, and Abraham offering up Isaac, both of which are to be executed by Messrs. Hardman and Co. It is intended to fill in the whole of the windows in the church with Scriptural subjects referring to the ministry of angels.

The new church at St. Michael, Bolingbroke-grove, Wandsworth-common, was dedicated on Saturday afternoon by the Bishop of Rochester. The church has been built at a cost of £1,500, and will seat 700 persons.

It is proposed to reseat and decorate the Unitarian chapel, Kendal. The ceiling will be paneled and ornamented in plaster, and the new seats will be of pitch-pine. The cost of the works, including new organ, will be about £1,000. Mr. Eli Cox, of Highgate, Kendal, is the architect.

The restoration of Kirkleavington parish-church, near Yarm, has been commenced. The contract has been secured by a Whitby firm. The cost will be over £1,000.

A new grain-elevator, which has for some time been in course of fitting up at the extensive warehouse of Messrs. Bush, in Prince-street, is now complete. The machine is so constructed that it will deliver grain direct from the edge of quay at any floor that may be desired. It has been manufactured by Messrs. Spencer and Gillett, iron-founders, of Melksham, and is worked by an eight horse-power Otto gas-engine. It is the only apparatus of the sort fitted up in Bristol.

The reopening of Gwyddelwern parish-church, Merionethshire, after restoration, took place on the 8th inst. The structure, from being in a most dilapidated and miserable condition, has been completely restored, renovated, and beautified at a cost of nearly £3,000.

An exhibition of artistic productions was opened on Tuesday in Lyme Hall, Cheshire, the object being to raise funds for the enlargement and improvement of the organ of Disley parish-church.

A traussept is being added to All Saints Church, South Lambeth. Mr. Sidney Smith, A.R.I.B.A., is the architect, and Mr. William Sheppard, of New-road, Bermondsey, the contractor.

The new portion of St. Paul's Church, Walkden, near Manchester, is now near completion, and will be opened on November 1, All Saints' Day.

A fire broke out on Tuesday on the premises of Messrs. Alexander Young and Sons, organ builders, Eldon-street, Chorlton-on-Medlock. An organ in course of construction for Worsley Parish Church and four or five second-hand instruments were consumed, together with a large quantity of valuable timber. The damage is estimated at between £1,500 and £2,000.

Trade News.

WAGES MOVEMENT.

NORTH WALES SLATE TRADE.—The North Wales slate trade, especially as regards the Bethesda and Llanberis quarries, still continues very dull. At the latter quarries the men engaged by Mr. Assheton Smith are working at a reduction of wages, while at Lord Penrhyn's extensive Bethesda quarries the output is still limited to four days, but there is a prospect of full time being shortly resumed. In Nantlle and Festiniog there has been a brisk summer trade, especially for export.

Lamplough's Pyretic Saline is refreshing, most agreeable, and the preventive and curative of FEVERS, BILIOUSNESS, SMALLPOX, SKIN DISEASES, and many other ailments. Sold by chemists throughout the world, and the Maker, 113, Holborn Hill. Use no substitute. See Medical Testimony.

Holloway's Ointment not only heals sores, wounds, and relieves external ailments, but, rubbed upon the abdomen, it acts as a derivative, and thus displays the most salutary influence over stomachic disorders, derangements of the liver, irregularity of the bowels, and other intestine inconveniences which mar man's comfort.

Douling Freestone and Ham Hill Stone of best quality. Prices, delivered at any part of the United Kingdom, given on application to CHARLES TRASK, Norton-sub-Hamdon, Ilminster, Somerset. —[Advrt.]

McLACHLAN & SONS, 35, St. James's street, S.W. Builders, Decorators, and House Painters. Designs and Estimates.

General Repairs and Alterations Executed: Experienced Workmen always in readiness, and sent to any part of the country. —[Advrt.]

BATH STONE.
BOX GROUND,
THE BEST FOR ALL EXTERNAL USE
CORSHAM DOWN

CANNOT BE SURPASSED IN BEAUTY OF APPEARANCE FOR INTERIOR WORK.

PICTOR & SONS, BOX, WILTS.

TENDERS.

* * Correspondents would in all cases oblige by giving the addresses of the parties tendering—at any rate, of the accepted tender—it adds to the value of the information.

AYLESBURY.—For the erection of four semi-detached cottages in New-street, Aylesbury, for Mr. T. Phillis. Mr. G. Luckett, Aylesbury, architect:—Darvell, R., Aylesbury (accepted)... £500 0 0

THE BUILDING NEWS.

LONDON, FRIDAY, SEPTEMBER 23, 1881.

LINCOLN'S INN CHAPEL.

A CORRESPONDENT in the *Standard* draws attention to what he calls an act of vandalism at Lincoln's Inn. It appears that the benchers of the Inn are enlarging their chapel, a well-known building in not the purest phase of Gothic, erected from the designs of no less an architect than Inigo Jones. As we may imagine, the very fact of this master of revived Classicism having had a hand in a Gothic building, does not say much for the correctness of the style, and yet there is a strange if not rich medley of details in this debased type of 17th-century Gothic, which makes it dear to the student of English architecture, if for no other reason, because it shows what so illustrious a master of Italian in this period of Gothic degeneracy did in a style which was then being everywhere deposed in favour of its successor. The chapel was built in 1621-3, and frequenters of this rather secluded spot know its features well. The existing chapel was three bays in length, and is 40ft. in the clear of the walls. Externally, the principal feature of interest is the groined basement, the walls pierced by four centred arches of wide span between the buttresses, and used now as a kind of store for all sorts of debris and fragments of masonry. The groining is massively treated, with large moulded ribs and traceried panels, and the style of the detail of the period is remarkable for the curious admixture of Classic and Gothic features. The outer-arch mouldings rest upon engaged columns with Tuscan capitals and other vagaries are noticeable.

Buttresses of considerable projection, having several deep set-offs, and pierced below by small archways, strengthen the upper walls of the chapel, and their use has evidently been dictated by the best considerations. The height of the walls, which rest on the series of piers of the basement, and the wide span of roof, which has only a collar near the ridge to tie it in, has justified certainly the employment of lateral support. The buttresses are cemented over, and the walls between them, pierced by windows of Perpendicular design, appear to have been constructed in a loose manner with old rubble and brickwork. The end gables have large pointed Perpendicular windows filled with stained-glass. The chapel, as everyone knows who has any acquaintance with Lincoln's Inn, was partly concealed by old chambers on the east side, and its large window was little noticed. A rather interesting feature at this end of the chapel was the old staircase which led to the chapel, described by the correspondent in his letter as a "beautiful groined staircase of Inigo Jones." It was square on the plan, with a centre square newel of masonry, and the quarter-spaces were groined in the same heavy manner as the crypt, with corner pendentives and moulded cusped ribs of massive section; the arches and pendentives sprang from massive corbels, semi-circular on plan and deeply moulded. Those who know Inigo Jones's work will not be surprised to find that these ribbed groined ceilings were anything but good specimens of constructive masonry. The principle of the arch is absent, and it is rather surprising to observe that the weight of the thick stonework was held up simply by the cohesiveness of the masonry, without any key. A piece of timber thrown across over the ceiling, suspended the middle pen-

dant, and the whole seems to have received support from this means. The curious way one of the corner pendentives sprang from the flank of a flat Tudor archway below may be noticed as an instance of the want of constructive knowledge of its architect, as no mediæval or modern mason would ever have thought of weighting the weakest part of a flat-pointed arch. This staircase has been taken down, and the stonework is, we are informed, to be carefully preserved. In the process of demolition, many curious instances of the want of knowledge of Gothic has been brought to light. The jointing of the stones of the ceilings we have been describing is one: no radial jointing is seen, and the arched form was given by small wedge-shaped pieces of stone, or a sort of "closer," which was used to fill up the joints. The stones are of shapes that show complete ignorance of stone-cutting of this character. It was also found that there was no stone sill to the great east window, which is being partly restored; the stone mullions were discovered to have rested simply on some very rotten brickwork, and no care at all seems to have been taken to give a good foundation to the pier, which is carried on a flat arch of only one half-brick rim. From what we have said, the staircase was not such a "beautiful" work as the correspondent of our contemporary stated it to be; and its loss is chiefly to be deplored because it robs us of a somewhat curious example of the age.

Entering the chapel, the chief objects of interest are the unique carving to the oak pews, the arched screen at the entrance end, the oak pulpit, the stained-glass windows, and the plaster groined ceiling. The pews are constructed out of solid oak plank, not framed into panels, and are in a capital state of preservation, dark with age; but the admirer of the grotesque carving of this period will be glad to learn that it is not proposed to remove the exceedingly rich bench-ends. These are designed with much playful fancy, and the scrolled tops are particularly interesting. The screen we have referred to, which crosses the entrance, and has a very pleasingly-designed arcading, open at the top, is quite Elizabethan in style. The west gallery supports, consisting of pilasters, seem to be in a similar style, but the carved pulpit is one of the choice things seen in the chapel. The ceiling, groined in plaster with ribs, is a meagre and poor specimen, and its cross-section or curve, a flat-pointed arch, is badly proportioned and unpleasing. The timber-roof, which is rather flat, is composed of principals tied by a collar just above the apex of the ceiling, and the lower angles are strengthened by pieces of timber bolted to the principals and collar to prevent spreading. This construction, as the reader will see, is very imperfect, and gives no direct tie, the cross angle-pieces being simply useful in carrying the ceiling-joists.

The alterations proposed, which are being carried out from the designs and under the supervision of Mr. S. Salter, architect, of Woburn-place, may be briefly described. The present east end, with its old staircase, is to be taken down and removed one bay further outwards, to lengthen the chapel. The plans show a new porch or entrance, with staircase to the chapel, which will form a projection from the end, and be finished with a flat under the old window. The details of this erection are designed in a Late Gothic style, preserving, as much as possible, the original character. There are two flanking pinnacles shown in the elevation for this end, which will rather emphasise the building. At the altar end the present railing is to be taken down and extended; but, we understand, the whole of the fittings of the old chapel will be re-used. The extension of one bay in length will, undoubtedly, add to the appearance of the interior; but of

the absolute necessity for enlargement the Benchers are the best judges. If, as one writer says, the chapel is more than large enough for the congregation which now worships within it, these alterations are a needless interference with at least an interesting relic of Old London, and the objections that have been raised have some reason. Although we do not agree with those who are led by the "craze" not to touch or improve a building, however much it may require it, we are bound to say a needless tampering is a kind of aggravated assault on a building of this description, which the benchers will be called upon to justify. We wish, however, to point out that the writers in our contemporary have interpreted in a wrong spirit that which has been done, and that their admiration for this work exceeds justification. Whatever may be the interest attaching to this chapel as the work of our greatest Italian revivalist, no one with any knowledge of Gothic architecture will pronounce it a work of art, or will say that its intrinsic merits deserve all the praise awarded to it by over-zealous antiquaries.

THE PROPOSED DEEP-WATER DOCK AT TILBURY.

A VERY considerable addition to the dock accommodation of London is in contemplation, which will overcome the tidal difficulties in the way of a speedy embarkation and disembarkation of large vessels of the ocean-carrying class. It is well known that the existing docks on the Thames are inaccessible at certain tides, and that ocean steamers, for example, the *Orient*, the *Austral*, and *City of Rome*, are increasing in dimensions every day. Such vessels require a large water area and greater depth than at present exist; and unless they can enter docks without delay, the greater speed they are made to attain is lost. Not only are the present docks inadequate, but the Thames above Gravesend is exceedingly shallow, and large steamers have now to anchor till the tide enables them to float to their destination. The river is also narrow and full of bends, so that a large vessel like the *City of Rome*, which measures 585ft. in length, cannot turn.

The proposal emanates from the directors of the East and West India Dock Company, who have under consideration a scheme which, if fully carried out, will make the Port of London independent of existing arrangements in providing for the large vessels engaged in Transatlantic passenger traffic. The directors have long been trying to increase their accommodation; they have found it impossible to cope with the growth of the steam-trade of the Port, and the rapid increase in the size and draught of vessels; and to enable them to retain the existing trade they have accepted and approved of a plan for the construction of a deep-water dock at Tilbury, opposite Gravesend, on about 450 acres of land or marshes, partly below water, between the London, Tilbury, and Southend Railway and the river. The situation offers facilities of the most unexceptional character; indeed, we do not think it possible to find in the course of the Thames a more eminently advantageous position, avoiding as it does the shallow reaches above Gravesend, and the narrow and tortuous bends of the river. It is well known by nautical men that the river is too shallow to allow of vessels of any great tonnage or size to lie in it higher up than the east end of Long Reach, partly owing to the gradual formation of mud-banks, which have been increasing since our sewage has been emptied down the river, and partly to the formation of the channel itself, its narrowness and tortuous course. The highest point of the river accessible to large vessels is Gravesend

Reach, at which point the new dock is intended, and here the width of the river is about half a mile, and the depth is greatest; that is to say, at the lowest possible tide—the lowest spring tide—the depth is, we find, 35ft. Such steamships for ocean-carrying trade as the *Oront*, and *City of Rome*, could not, under the existing state of the river, get higher than the point we have noticed, but the new deep-water dock will afford them an ample berth, and enable them to "swing" easily.

From an inspection of a large plan and model of the intended dock, we find it will occupy an area within the port of 62 acres of water, and that the conditions of the tide at this point will enable steamships of the vast dimensions and great draught engaged in the East India and Colonial trades to enter or leave the dock. If the plan as projected by Mr. A. Manning, the engineer to the company, and Mr. F. C. Ahlfeldt, the manager of the East and West India Dock railways, is realised, the port of London will be independent of tide, which now operates against other great ports, and will be placed in the unique position which the short passenger communication between London and the dock will give it. The directors in their report to the proprietors urge the advantages of the scheme without exaggeration. They point out the merits of the situation opposite Gravesend, the well-established point of arrival and departure of all vessels trading with London, within protection of the forts on the Thames, and at a position in the river up to which the largest vessels can navigate at all states of the tide, there being 35ft. of water at low-water spring tides; that vessels will thus be able to discharge at the docks at once, without the delay and expense of an anchoring at Gravesend to wait for the flood tide as they do now; that all river towage and pilotage and risk attending navigation above this reach will be saved, and that the present Tilbury Railway will allow goods and passengers to reach Fenchurch-street in less than forty minutes, thus bringing the dock into communication with all the great trunk lines of railway and the company's present warehouses.

These general views are borne out, we may add, by the actual facts, and we are indebted to the courtesy of Mr. Manning, the engineer, and also to the explanation of Mr. Ahlfeldt, the manager of the E. and W. India Dock railways, for much of the practical information we are now enabled to lay before our readers. First with respect to the position of the dock, which is between Tilbury and Grays. It is a matter of considerable moment that those gentlemen have hit upon a point on the river, really the entrance to the port of London, and within easy access of it under all conditions of the tide. The docks themselves have been planned to give every facility to large steamships entering; the main axis of the proposed dock bears a little in a north-westerly direction from the river, not at right angles to it, and thus avoids a fault in the plan of the contemplated dock at Dagenham. The plan of the deep water dock at Tilbury shows a main dock of 16 acres, about 1,500ft. long by 750ft. wide, and a uniform depth of 35ft. of water, with three parallel branch docks, each about 250ft. wide and about 1,500ft. long. The largest of the dry docks will have a total length of 825ft., and a sill 27ft. below high-water mark, thus enabling the largest type of vessel to enter. According to the synopsis of the scheme prepared by Mr. Ahlfeldt, "the quay berthing accommodation will comprise a length of 15,000ft., with a uniform depth of 35ft. of water, and thus there will be no necessity to remove a vessel of the greatest capacity and draught for the completion of her loading to the outer or tidal basin." The tidal basin has an area of

16 acres, and is 41ft. deep at high-water spring tides, and at the lowest tide there will be a depth of 26ft. It will give accommodation to the largest vessel afloat. One of the greatest difficulties, that of loading in dock, will be thus overcome. It is often necessary for a ship to finish loading in the tidal basin, which necessitates not only delay but expense in the removal of goods, as well as occupation of the basin. By the present scheme the tidal basin is in readiness at any moment for the entrance of large vessels. The tidal basin is of an irregular pentagonal shape, with an entrance from river of 200ft. wide, and is connected with the main dock by a lock 700ft. long, 80ft. wide, and a depth on the sill of 40ft. The area of the graving-dock, with caisson provision, is large enough to afford berth to a vessel of 825ft. in length, or to two of the ordinary dimensions of 400ft. The docks have ample warehouse provision along the quays in easy connection with the Southend and Tilbury railway, which will have a new station at the north-east corner of the dock, and a junction for goods from the railway sidings of the quays. Coaling berths, cattle lairage, shears, &c., are provided round the dock. With regard to the accommodation of the new dock, it is calculated that working berths for 30 large steamers, averaging 100ft. in length, will be given.

The inland railway traffic, especially grain, has been consulted in the plans of the new dock, and granaries and elevators with lines of railway have been proposed, so that cereals and food-stuffs from America can be dealt with in a manner equal to the requirements of the growing trade. Steamers will be coaled simultaneously from both sides by the arrangements. A powerful floating derrick and shears are to be erected, and the expeditious transit of goods and passengers will be aided by the railway route, the junctions near Barking, Bromley and Bow on the Tilbury line. The railway will traverse the landing-stages. We understand the estimated cost of these great undertakings, including purchase of land, which admits of easy extension of the dock to twice the present area on the west side, is £1,100,000, and the directors estimate a nett profit of more than 10 per cent. will be secured without depriving the existing docks of trade.

The Peninsular and Oriental Company are already making preparations for making the Gravesend tidal dock their port of departure and arrival, and other companies must follow, if the central position of Gravesend and time in transit count for anything. The new scheme will make the large trading and shipping companies independent at least of the natural advantages even of tidal harbours such as Southampton, one of the finest in the kingdom; and we may here refer to the peculiarities which have made that port what it is. A glance at the map will show that Southampton stands at the head of an inlet of the sea known as the Southampton water, and that at this point the estuaries of two rivers, the Test and the Itchen, enter it. This tidal estuary of the sea is about two miles in breadth and extends eight miles in a south-easterly direction to Calshot Castle, where it joins the Channel opposite Cowes roads. A rather singular thing in connection with this water is that there are four tides every 24 hours, a phenomenon due to the obstructive action of the Isle of Wight, which forms a natural breakwater, allowing only a small portion of the great tidal wave in its progress up Channel to flow up the Solent, causing the first tide. When this begins to ebb, the main body of the great tidal wave, which is now coming up by Spithead, another passage, drives the descending current back, and causes a second tide, about two hours later, which second rise is 6in.

higher than the first tide. This double tide is obviously of great practical value to the port, as large vessels have the advantage of two additional hours, and the captains of vessels experience no difficulty in the passage up and down the Solent and Southampton water at any time of the tide. A further advantage is that large steamers of 2,000 tons are navigated to and from the docks in perfect safety either night or day. There are no other natural ports with which we are acquainted which offer this advantage, while Liverpool and other great commercial ports suffer from approaches subject to tidal conditions, with shallow bars at their entrance, or their navigable channels are useless at low tide for vessels of large tonnage. Under these circumstances, the directors of the East and West India Dock Company are to be congratulated on a scheme which will enable them to retain the prestige they have so long enjoyed.

COMPETITION DRAWINGS FOR DAIRY HOMESTEADS.

THE designs for a dairy homestead submitted in competition for the prizes and medals offered by the British Dairy Farmers' Association have been on view at the Agricultural Hall, Islington. As on previous occasions, the contest has been chiefly between two or three well-known gentlemen who have been successful competitors in former years. The names of those whose designs were exhibited are: Mr. Richard Waite, Duffield, Derbyshire, architect; Mr. Thomas Potter, Alresford, Hants; Messrs. Addie and Sons, Preston; Mr. Gilbert Murray, Elvaston Estate Office, Derby; Mr. A. R. Cragg, Cadley, Preston, architect; and Mr. William Alford Ward, Bristol, land agent. On this occasion a dairy homestead for "40 cows in milk," also sheds for cows dried off for calving and fattening," was required. Each set of drawings was to include plans, sections, and isometrical view, the former drawn to a $\frac{1}{4}$ in. scale, with details $\frac{1}{16}$ in. Specifications and estimates were also required. The drawings submitted are hardly equal to previous exhibitions, though they evidently evince the work of practical men.

Mr. R. Waite, of Duffield, Derby, has been fortunate again in winning the first prize of £10 and the Silver Medal. Last year, Mr. Waite took the prize for a plan of a homestead of very similar arrangement, a bird's-eye view and plan of which will be found in Vol. XXXIX, page 491 (Dec. 17, 1880). The present design is for a homestead for forty cows in milk. The chief difference between the former plan and this arrangement is, that an open roadway separates the two double cow-houses in the present instance, so that each cow is kept perfectly isolated, and thus the risk of infection is diminished. The stalls are tie-up stalls. The roadway is 10ft. wide and affords both light and ventilation. The author shows a doorway from each cow-house opening into it, and the feeding passages, 5ft. 6in. wide, are arranged conveniently close to the mixing-room, one directly leading into it. The mixing-room is 30ft. by 18ft., and has a store for corn and cake, and the straw barn occupies an adjoining room of nearly equal size. The arrangements for feeding are rendered more perfect by the construction of the stall divisions adopted by the author. Thus the partitions dividing the cows, and also the gangways are formed by horizontal ash rails, instead of the usual dwarf wall, thereby promoting circulation of air in front of the cattle. The rails can be adjusted with ease, and the feeding operation is facilitated. The details of troughs, given by Mr. Waite, are sensible and cleanly. They are formed of blue bricks (vitrified) with a moulded capping or

torus at the top, each side being 11in. high, and a bottom slab 11in. by 2in. thick between. These are set in cement. The author makes the head and heel posts of his stalls of cast-iron, with flanges in the head-post, by which means the travis boards or rails, which are battens 7in. by 2 $\frac{1}{2}$ in., can be altered as necessary, for cleaning or ventilation, and no framing is required. Ventilation is assisted, also, by making the doors in two heights, hung to hook-stones. Four loose-boxes, 13ft. by 9ft. 6in., for a bull, young calves, cows, mare and foal, or for sick beast, are shown at the end of stalls, each has a door and window provided, also a communication with the inner feeding passage. A shed for fattening cows, with eight tie-up stalls separated from the milch cows, is shown on the east side. On the south side is a yard for young stock, partly covered, with gateway abutting on the roadway; there is a liquid tank at the end of roadway between the cow-houses, while on the north side, separated from the main block of buildings, and not too near the dairy, is a range of piggeries, each division having a covered sty and an open yard; besides a gig-house and implement shed to the north, near hay-barn. The piggeries are well provided with the necessary appliances for feeding. A roadway on the west side separates the dairy buildings and farmhouse from the homestead, and the author shows a well-arranged block of buildings, with a large kitchen, court, and a convenient house.

With regard to the construction of the buildings, we may add that the cow-houses have timber roofs of queen-post construction, with openings for ventilation on each side of the ridge, which can be economically made; the walls are of brickwork, with ventilators, and the floors are intended to be paved or concreted. The straw-barn is carried up two floors, and the food department is next the stackyard on the north side. The walls of the cheese-room and dairy are built hollow, thus avoiding the extremes of heat and cold. On the whole, economy of labour and compactness have been studied; the departments are near, the means of ingress and egress are good; and light and ventilation, those two fundamental requisites of a healthy farmstead, have been well considered in the plan and construction. The estimates furnished give the cost of homestead and piggeries at £1,200, and of the house and dairy, £800.

The second-prize design, which receives £5 and a bronze medal, with motto "Truth," is M-shaped in its general plan. The double "byre," or cow-house, forms a central building, projecting from the food-preparing range, so that it is near to the mixing-room and root-house. There is a 5ft. feeding-passage, and each cow-house has an entrance and exit to yard and roadway. The calf-house and two loose boxes are placed conveniently near the cow-house at the west side of cow-yard, and each box has its own separate yard. The extreme west wing of the block contains the piggeries, which are fed by the same feeding passage which traverses the calf boxes. On the east side of the cow-house, enclosed between it and the stables on the outer side, is a shed for store cattle, 49ft. by 25ft., and the author points out that only a roof is required, which can be carried by the side-walls of those buildings. The feeding-passage is continued round on all the three sides, and the stable range contains a loose box and a gig-house. A roadway surrounds the buildings on three sides, and the dairy and house are proposed to be placed on the south side of roadway. In the construction we find the roofs are of timber, with raised louver-board ventilators along the ridge of cow-house, &c. The author treats the elevations in a simple and inexpensive manner. The walls are proposed to be of red-brick, and the roadway side

forms a series of gables. A vigorously-coloured perspective view accompanies the set. Economical construction has been the aim of the author, and the estimate for the homestead is £1,567, and for the dairy and house £625, making a total of £2,192. The author is Mr. A. Richard Cragg, of Cadley, near Preston.

"Islington" is another able plan; we believe by Mr. Thomas Potter, of Alresford, Hants. The departments are well placed; there is a central cow-house, 89ft. long, at right angles to which, in the centre, on the north side runs a food-preparing house, connected by a tramway and turn-table with the cow-house. A large covered cow-yard opens on the south side of the latter, roofed in by an exceedingly wide-span flat roof of iron. The calf-house and infirmary are conveniently placed at the end of cow-house, also cow-boxes. A nag-stable and yard occupy the south-east corner and the piggeries the north-east corner of the steading, the implement-shed faces north, and cart-horse-stables and a horse-yard fill up the area on the west side of food-preparing house. The details are well considered, and the total estimated cost is from £3,250 to £3,750.

"Winton" is another design we believe by the same author, but the plan is far less economical. An open yard and covered shed are shown on the south side, the piggeries adjoining the food shed. There appears to be a considerable distance between the food-preparing house and the cow-house, which provides for 52 cows. There are calf-boxes at one end, and the dairy and house are placed on the east side.

"Agricola" is a plan which exhibits a practical knowledge of homestead arrangement, and the details are given with a fulness which other competitors have not thought worth while to follow. The distribution of the departments partakes in plan of the letter M. The cow-house occupies the centre, at the north end of which is the food house, the two being connected by a gangway. The west block or wing contains the piggeries and calf-boxes, between which runs the feeding passage. Between this block of building and the cow-house are sheds for fattening stock with a covered and open yard in front 68ft. by 58ft., covered by an iron roof in two spans. On the east side in a corresponding position is the barn with an open yard 60ft. by 58ft. also in front, while the eastern building is the stabling. The house and dairy are placed on the south side in a central position for supervision. Several drawings of details are exhibited, such as the bostings to shippin, the boarded framed partitions to stalls, the ironwork, tile trough, and details of iron roofing.

"Science and Practice" shows a large square open yard with a covered manure-pit in the centre; it is surrounded by buildings which form a quadrangle. The cow-house for 32 cows is on the north side, the stable and cart-shed on the west, and the piggeries and loose boxes on the east. The central manure pit measures 135ft. by 114ft. The chaff and mixing room divides the standing for cows, of which there are 16 in each; half of these are covered sheds for calves. The fault of this plan is the large area enclosed, and the want of economy in the labour of the stockman's supervision.

The committee have exercised some judgment in their choice; and the two designs to which they have awarded prizes are certainly the most economical. The area of ground occupied in both the successful designs is small compared with the others, and the whole homestead is comprised under continuous roofs, so that labour is saved and the inconvenience of separated departments avoided, with all the waste and discomfort attendant in open yards. It has been long ago recognised by farmers and

practical architects, especially in Scotland, that the covered yard not only improves the quality of the live stock but prevents deterioration and waste of food. An equable temperature is obtained, and the central position of the straw and root-houses affords easy feeding and littering. There are, we know, differences of opinion under this head; there are a few who contend for air and sunshine *ad libitum*. With that, it is said by some, the cattle become hardened to exposure and thrive better. Facts, however, have established the necessity of moderate temperature, and it is certain that cattle sooner fatten and require less food when they are protected. Many of the competitors have adopted the partially open yard, which seems to be in favour. In the erection of homesteads architectural considerations count for little. The principal thing is a good grouping of the buildings and roofs, and it is satisfactory to find plain brickwork without costly ornamentation has been aimed at in the premiated design. It must be allowed that the committee have made a good selection, though we should like to see the competition larger, made more worthy of professional ambition by higher prizes, and entered into with a greater sense of the importance and usefulness of this branch of practical architecture.

SOIL-PIPE DISCONNECTION AND SEWER-GAS.

IN our former article on "the Battle of the Traps" we pointed out the general bearings of the subject, and discussed briefly the principal facts upon which the advocates of the siphon or S-trap, and the U-trap base their claims for preference. The controversy has since then been continued in our columns with considerable spirit, though without the introduction of any material features of novelty. The dispute in question is one which can be settled satisfactorily only by practical trial, and in the present state of our knowledge it is a matter of regret that we possess no independent body or central authority competent to make a few simple experiments, which would decide once and for all the present controversy, and whose verdict would be accepted by all parties as conclusive. It is unsatisfactory to Mr. A. to learn that Mr. B. has made a careful model of his trap and finds it fails to accomplish all that Mr. A. has claimed for it; because Mr. A., after carefully testing Mr. B.'s trap, is similarly unable to make it answer under the very conditions for which it was designed, but under which it is rarely shown in operation. All the trials and tests hitherto recorded appear to have been made by those who are more or less of partisans; and, without in any way desiring to impute to these gentlemen a bias, it is impossible that their results can carry with them the weight that would attach to experiments conducted by an independent observer. The one fact that all makers of traps will agree to is, that the object to be attained is the exclusion of a subtle gas, unavoidably present in the soil-pipe, and, so to speak, laid on to every house. The time may, perhaps, come, when the real dangers of sewer-gas are better appreciated and understood, when we shall take some surer means to keep it out of our houses than the present clumsy device of a water-trap. Experience has taught us a far safer mode of dealing with coal-gas, and a good air-tight valve can readily be made and fixed; but anyone who proposed that each closet connection, or even each soil-pipe, should be provided with an air-tight valve, would be laughed at, and, in fact, after the best set of valves had been fixed, we should not do away with the danger; for gas would get through at each use of the closet, as it does now with the

best \square or ∞ -trap ever made. Of this there can be no doubt, however—that the soil-pipe should be made as free as possible from sewer-gas by disconnection at its foot, and by the continuation of it for the full diameter to above the eaves of the house.

While we in this country have been disputing about the best form of trap, a German medical man, Dr. Lissauer, of Dantzie, has been carrying out a series of most careful and comprehensive experiments on the siphon-trap, and the results of these experiments, published in the last number of the German *Quarterly Journal of Public Health*, will indicate, at any rate, the manner in which the question should be approached, and will certainly serve to determine many disputed points. He found that since the completion of the new sewerage works there were many cases of illness in the town, and he succeeded in tracing most of these to glaring defects in the house-connections and sanitary fittings. He determined, therefore, to undertake a practical examination of the manner in which sewer-gas may gain admission into dwellings, and to test thoroughly the efficacy of the water-seal in the siphon-trap in common use.

For the purpose of these tests the hoppers of the closets and the water-supply were removed, leaving exposed only the glazed stoneware siphon-trap, 11 centimetres in internal diameter, attached to the soil-pipe.* He first ascertained the exact water-content of the trap to the level of dip, which was 1,100 cubic centimetres, and then the further amount of water necessary to fill the bend of the siphon to the overflow level, an additional volume of 350cc., with a depth of 1½ centimetres, which represents, of course, the seal. He then emptied the trap completely, and placed at the bottom a lighted taper, immediately beneath the dip. From frequent observations of the air-currents, which he was thus enabled to study most perfectly, he ascertained that the general tendency of the drains was to suck air from the house at all periods of the day and night. In gusty, windy weather these conditions were sometimes momentarily reversed; but the flame was in nearly every other case drawn towards the soil-pipe. When water was poured down in the closets connected with the same soil-pipe on the upper floors (his experiments were conducted in this case on the ground-floor), there was such a violent outrush of air as sometimes to extinguish the taper. The banging of doors, and distant movements in the main drain, all influenced, for a moment, the flame of the taper.

Having thus studied the air-currents in the soil-pipe, he filled the trap, and noted the time required to destroy the seal by "waving-out" and "siphonage." In five days the 1½ centimetres of seal had been wholly lost, but in less than 10 hours the sewer-gas had forced the seal. To note the manner in which the water was blown out, he suspended strips of paper, and coloured the water black. He gives tables to show the time taken to reduce the trap to nil, and the daily loss. He next fitted up a much more complex apparatus to measure the fluctuations in pressure of the gases in the soil-pipe; and he ascertained that pouring down water in the upper part of the house had the effect of compressing the air in the soil-pipe to the equivalent of sustaining a column of water from 1·6 to 2·2 centimetres in height. A great many experiments were made to determine the varying pressure on the trap, and he devised a very simple and effectual apparatus, which he terms a "restitutor," to replace the water lost by waving out or siphonage, which apparatus was perfectly automatic in its action, and could be applied to any closet. He then made similar experiments with a

sink-trap of the ordinary form, and found that this took 52 days to become exhausted.

He next had a trap made with glass cheeks, and supplied with millimetre scales dipping into the fluid on each side of the seal, and noted the minute variations in the level of the water in each limb of the siphon, due to various causes. He also employed a soda solution in the trap, and suspended strips of turmeric paper to measure the height to which the pressure in the soil-pipe would force up the water in traps with seals of various depths. He was led from some of his experiments to think that the chemical condition of the water in the trap had something to do with the facility with which the gas passed through it, and he found that while pure spring-water in a trap, with a seal of 1½ centimetres, required 19 buckets of water thrown down in the upper closets to force it; when he used in the trap water saturated with carbonic acid-gas (the chief soluble constituent of sewer-gas) five buckets only were required to force it. From numerous experiments, he deduced the unvarying law that the resistance of the trap was inversely proportional to the facility with which the water it contained became saturated with the sewer-gas.

His investigations were conducted in different houses, but always with traps of the same form, and he was led from his experiments to conclude that for ordinary domestic use a seal of not less than 2·5 centimetres (6·98lin.) in depth should be insisted upon. His next observations were directed to the best means of ventilating the trap—i.e., of providing a mode of outlet for the confined gases, other than through the water-seal. After many trials he found that by making an orifice, not less than 3 centimetres in diameter, in the top of the bend of the trap, and continuing this into a ventilating-pipe having free communication with the atmosphere, both at the top and bottom, placed alongside of the soil-pipe, the most violent fluctuations in pressure only caused a variation in the water-level of the trap ranging between 1 and 2 millimetres (from 0·039in. to 0·078in.) The force of the compressed air was, in fact, expended through the ventilating-pipe, instead of through the water-seal. He found that ventilation into the soil-pipe by an ascending pipe gave very little relief as compared with that to be obtained by ventilation into a special pipe provided for the purpose, and his observations were so conclusive as to the benefits resulting from ventilation of the trap by a pipe of sufficient size that the authorities of Dantzie have made this plan compulsory in all new buildings. The pressure of the sewer-gases are by this means reduced to about one-tenth of that observed in unventilated traps. The restitutor, when in daily use in an ordinary dwelling-house, attached to a trap of the common pattern, showed an approximate waste of 500cc. (0·88 pint) per diem, as the volume lost by siphonage and waving-out. A trap containing 1,960cc. of water, with a seal 2·5 centimetres in depth in an unused closet, withstood the ordinary use of the soil-pipe in a dwellinghouse, where the remainder of the apparatus connected with the same soil-pipe was in heavy use, for five days and was only forced on the sixth day. The use of the upper closets in the ordinary way was found to be approximately equivalent to the pressure of a column of water 1 centimetre in height, while the violent discharge of a pail of water into the closets was equal to a similar pressure of 2 centimetres. A trap with a seal of 2·5 centimetres became so far siphoned out, after nine buckets of water had been thrown down in an upper closet, as to become useless; the trap was forced when the seal was reduced to 1·3 centimetres. Many other tests are recorded, all of them conducted in a most painstaking manner,

and furnishing us with a comprehensive record of the pneumatics of the soil-pipe, but the diagrams which accompany the essay are needed to make some of these experiments intelligible. One of the experiments appears to have had very remarkable results, for, under certain conditions, the whole of the water in a large trap, having a seal 40 centimetres (15·74in.) in depth was siphoned out in a few seconds.

The account of ten cases where sickness was directly traceable to defective closet-fittings is very instructive, but scarcely concerns our readers, as these cases have a medical rather than an engineering interest. The doctor concludes his observations with a few general remarks, among the chief of which is his firm belief that all the house-connections and sanitary appliances should be under the direct control of the local authorities. He points out that in a town like Dantzie, where the tendency of the sewers during the greatest part of the time is to suck in air from the houses, this very fact presents an element of safety (which appears to be absent in the English system of drainage), and renders an open-air disconnection at the foot of the soil-pipe of no advantage. He states that so much apathy and ignorance of the true nature of a sewer-trap prevails among all classes, and even among those whose business should lead them to master the subject, that domestic fittings should be inspected and passed by a competent sanitary authority before entering into use.

SHOP-WINDOWS.—No. I.

SHOP-windows, like the Stage, are a mirror of the times we live in. They shadow forth the state of art-manufacture, and are an index as to the extent of its appreciation by the public: at the same time they wield a most powerful reaction through their fascinations, and we unconsciously form many of our likes and dislikes from the constant sight of their contents. For there can be no question as to their attractiveness. If our country cousins come to pay us a visit in London, do they not devote their first morning to the shops in Regent-street in preference to the Royal Academy? To the idler, and the man of leisure, shop-windows are a never-failing source of amusement, while even the man of business is often beguiled into a glance at them as he hurries from one appointment to another. Suppose we run over to Paris—do we instantly send off for places at the Opéra or the "Comédie," or do we not rather stroll quietly along the boulevards during daylight, and invariably inspect the shops in the Palais Royal when lighted up? Even the magnificent Mosque of St. Sophia at Constantinople has to await a visit from most travellers till they have made at least a cursory acquaintance with the bazaars; while at Brighton, Scarborough, Interlaken, or Monaco, no small portion of the day is devoted to the shop-windows, and to the purchases of trinkets—useful or otherwise—hardly to be met with in the more prosaic establishments of large towns.

If, then, shop-windows do exercise so powerful an attraction on the community at large, it is worth while to consider their condition; and we propose, therefore, to notice a few of the more salient features that they present to us here in the metropolis of the world, together with the state of a few of the most important branches of art-manufacture as displayed in them.

The structural materials employed in our buildings, important as they are, come hardly within our scope in dealing with shop-windows; but the decorative materials undoubtedly do; and it is the more important to notice these, as from the arts cognate with architecture has undoubtedly emanated that extraordinary change in all matters of taste which the present aspect

* The closet apparatus was apparently a simple hopper-pen, with no valve or container.

of our shop-windows so strongly evince. Forty years ago taste in everything, except port-wine, was at its lowest bathos. Furniture, wall-papers, dress (male and female), plate, glass, and china, all vied with each other in hideousness; and it would puzzle many a sapient critic to say which of the lot bore off the palm for atrocity. Nowadays all this is changed; and though we may still find much that is susceptible of improvement, and may point to the alluring displays of specialities in other countries, still, when we consider the multitudinous products of the applied arts in which London deals, the shop-windows of the metropolis form an exhibition delightful to the cultivated eye, and, as a whole, one unrivalled in any other city in the world.

This improvement, as we have said, has been associated with, or rather has arisen out of, the gradual development of modern architecture; and affecting, in the first instance, the various matters connected with the embellishment and fitting-up of buildings, as they leave the architect's, or, at any rate, the builder's hands, has gradually influenced every kind of subsidiary art-produce. It may be traced back to about the time of the commencement of the Houses of Parliament, when the elder Pugin, as the apostle of the Gothic revival, published his "True Principles of Pointed Architecture," and threw down the gauntlet to the then-existing and so-called Classic school, with all its shams and abominations, and as Turner and, later-on, the Pre-Raphaelites did to the Academical School of Painting, and as Hahnemann did to the lancet and the pillbox. Pecksniff had, perforce, grumblingly and pugnaciously, to succumb, and a better state of things came gradually about. But architecture had an easier task in its reformation than the applied arts. Not only in our native land, but in nearly every civilised country of the globe, buildings exist—the purest of their several types—from which the principles of their design and construction can be and have been exhaustively studied, and either reproduced in modern work or developed and adapted to modern requirements, in accordance with engineering appliances and nineteenth-century inventions. Not so with the decorative arts. Although, as architecture progressed, the need of aid from subsidiary handicrafts was keenly felt; there were comparatively few specimens of art-wares that were readily accessible. Many of the processes employed in their manufacture (such as the production of the ruby glass in the old stained windows, and the tempering of the ancient Damascus sword-blades) had been lost, and an entirely new race of artisans had to be, as it were, created, and educated with the perceptive faculties and the deft execution necessary for the work. Furniture and Decoration were in a specially doleful plight. Mediæval customs and requirements were primitive; and the trestles, settles, bedsteads, and presses of those days, though frequently quaint and characteristic, were rude and cumbersome—rather, indeed, specimens of carpentering than anything else. They belonged, in fact, to what has been called "the packing-case school" of furniture; and it was not till a much later period that the methods of construction were developed which now obtain everywhere in the production of the best upholstery and cabinet-work. In decoration, carving probably played a more important part than painting: at any rate, few examples of the latter art remained. The wooden roofs—no doubt originally painted—had ever and anon perished from fire, and the walls had suffered but too ruthlessly at the hands of the Puritans. Such examples as still existed were chiefly archaically treated figure-subjects, with borders of rosettes or chevrons, diapers, and powderings of

stars or fleurs-de-lys. Even these were principally confined to the churches; in private dwellings, the walls, when not hung with textile fabrics, were usually lined out in red or black, into shapes of brick-work or masonry in the upper part, while the lower was painted in flat tints, to represent a curtain. This very effective method of treatment has of late years been used in many of the newly-decorated churches and cathedrals, both of this and other countries, and notably in Northampton Town Hall. Much was learnt and many hints were taken from the Great Exhibition of 1851, when our foreign rivals put us to shame in much that concerned aesthetics, and, touching the *amour propre* of our art-manufacturers, stimulated them to efforts at improvement in design which have since borne the richest fruits. Nor must the influence of South Kensington be overlooked. Though too untechnical in its teachings, the central school of art, with its ramifications throughout the country, has mostly trained the public taste, and so created a market for the improving products of the factories.

The study of the illuminated manuscripts of the Middle Ages, has, no doubt, been of great assistance to decoration, but it owed far more, in the early days of the Gothic revival, to the magnificent stained-glass windows which, happily, abound yet in England, France, Germany, and Italy, and constitute one of the first glories of Mediæval art. Not only has the old stained glass gradually exercised a powerful influence on decorative ornamentation, but it has brought about the resuscitation of its own long-forgotten production. It is a material not readily exhibited in shop-windows; but as we see it to-day in our churches and public buildings, and variously employed in many of our houses, it is one on which we may justly pride ourselves in this country as well as high rivalling in excellence its ancient prototypes. And it seems the more strange that the Bavarian glass-painters, with splendid specimens of the truest and finest treatment in their midst: such as the windows of Nuremberg and Ratisbon for instance, should still persist in a pictorial treatment of their windows entirely subversive of the lovely effect upon which stained glass depends when properly dealt with. Who, that has ever seen the nave of Cologne Cathedral, can forget the difference between the lightness, richness, brilliancy, and gem-like sparkle of the northern windows, filled with the ancient glass, and the ghastly transparencies of the Munich school on the south, false in colour, affected in the drawing, wrong in construction, deterrent of the light, and resembling diaphanous far more than glass? Happily the Munich school, as far as we have observed, has had few admirers among us: still, we are the reverse of grateful to Herr Mayer for opening an establishment in the middle of Bond-street for the display and sale of his windows and other articles of German "Gothic."

To no one individual, probably, does the present condition of our English glass-staining, as well as of internal decoration in general, owe more than to Mr. William Morris, the well-known poet, who, to his literary labours, has for many years added those of presiding over an unpretentious, but much-achieving "shop" in Queen's-square, Bloomsbury. We recollect a paper being once read on "Polychromy in Decoration" at the Institute of Architects, when, after the usual lengthy discussion by the learned pundits, the late Mr. Burges was asked to speak. Staring around him with a semi-comic smile, he said: "Mr. President and Gentlemen, I will not detain you with any lengthy remarks, as I think them uncalled for. I consider an eye for colour is the gift of a good God, and there's an end of it." Mr. Morris has not only the

most perfect eye for colour, but a delicate appreciation of forms quaint but not inelegant, and of that true spirit of conventionality which discards all realism, while it retains the life and essence of the thing depicted. We wish that we could say the same of the late and talented Mr. Owen Jones, who, at one time, exercised a most powerful, and to our mind a very baneful, influence on coloured decoration. His reign commenced with the Great Exhibition of 1851, and his power fully established itself at the opening of the Crystal Palace, the colouring of which he, in a great part, superintended, and the Alhambra Court of which was universally recognised as the most exquisite gem in decoration that had been seen in England for many a long year. But Mr. Jones was too wedded to the Moorish style, with its lifeless conventionalities and peculiar scheme of colouring. He adopted the axioms of M. Chevreuil, the French *savant*, which, valuable as they were as to the use of colour when first enunciated, and as they still continue to be for general guidance, aim, nevertheless, at substituting cut-and-dried rules as to harmonies of analogy or contrast, proportions of primary, secondary, and tertiary hues and tints, and what not, for Mr. Burges' "eye for colour," and thus reducing chromatic art to so many mathematical formulæ. The apostle of the Alhambra did, however, good service in compiling and publishing his "Grammar of Ornament" at a time when the various styles of Oriental, Classic, and Mediæval decoration were little known, or understood; and in this, as in the decoration of the Crystal Palace Courts, he was most ably assisted by Mr. (eventually Sir) Digby Wyatt, who, although less prominently before the general public, was by far the truer artist of the two. Until the Great Exhibition, and, indeed, long after, ordinary English wall-papers were too atrocious to think of, and Mr. Owen Jones produced a number of conventional designs which, though mostly Moresque in treatment, were executed in many good neutral colourings. As the "Gothic" papers consisted then of little else than gold stars or fleurs-de-lys upon a violent ground of ultramarine blue, these new productions greatly commended themselves to architects and amateurs, and paved the way for our present English school of paperstaining. But with the erection of St. James's Hall, the ceiling (but not the wall-surface) of which is one of this gentleman's most successful efforts, the Alhambra craze seemed to affect him with redoubled virulence; his colouring became more and more crude, until some dozen years ago we witnessed the sad spectacle of a new London mansion in the refined Barry school of Italian architecture, ruined internally by Mr. Jones's application of coarse quasi-Moorish ornament, stencilled in ultramarine, ochre, and vermilion, in immediate juxtaposition with the most artistic and delicately-modelled plasterwork. Meanwhile, however, a great change was steadily taking place, in which, as we have said, Mr. Morris has had no small share. As the real principles of real Gothic, as of all true living art, began to be understood, Mediæval forms were less insisted upon, even by their most enthusiastic admirers, except for church-work, and individuality was recognised as a better thing than mere servile copyism, so long only as it went hand-in-hand with truth, both of construction and design. The emancipation which architecture thus obtained necessarily extended itself to decoration, while the vast importation since 1858 of various Oriental wares, consequent on the abolition of the East India Company's trading monopoly, and still further through the recent opening up of Japan, has exercised an influence that

can now be seen in the free conventional treatment of nearly every object employed in English decorative design.

We have dwelt at some length on the progress of decoration, as exemplifying that of the applied arts generally, a right understanding of which is essential to those who take an intelligent interest in art manufactures. We now propose to glance briefly at some of the products both of English and foreign factories, as actually displayed in our shop-windows for public inspection and purchase.

Starting, then, with decorative materials, we find a most wonderful improvement within the last thirty, and especially within the last dozen, years. No doubt many of our readers will recollect the institution of the "Chamber of Horrors" at Marlborough House, when the present abode of the Her Apparent was still the forerunner of the South Kensington School of Art. They will call to mind the carpets of brown shaded roses on a crimson ground, the hearth rugs devoted to Newfoundland dogs, and the ill-drawn peonies and cacti that mendered idiotically amongst the most hideous and meaningless of scrolls upon the chair-coverings, curtains, and wall-papers. Let them now look carefully at the windows of the best upholsterers and decorators. They will find rugs and carpets not only from Turkey, India, and Persia, in countless variety, of moderate price, and exquisite loveliness, but those produced by ourselves at Glasgow, Halifax, Kidderminster, and Wilton, in which we have not only learnt from Eastern nations, but have turned the learning to good account in the production either of simple designs in quiet neutral colourings or of harmonious blendings of brilliant colours in small quantities, that equally produce the softness and repose essential to a floor-covering. The variety of upholstery fabrics is inexhaustible. Pure silk damasks and satins are now, perhaps, less used than formerly, but the staring blues, ponceaux, mauves, and magentas have given place to colours in which the old painters would have revelled; while for beauty of design, and durability, our best English silks, such as Walter's, and perhaps Fry's Irish poplins even rival, if they do not surpass, the products of the Lyons looms. "Waste silk" has of late years been extensively employed in the production of hangings which, although they rapidly soil and fade, have the great merits of being both cheap and artistic. To the thousand and one "tapestries," a woollen fabric of every conceivable name and texture, and of French as well as English make, which have replaced the rep curtain and inevitable "key" border, we can only direct the observer's attention, as being a treat to look upon, as he strolls from window to window. The most splendid and luxurious of the upholstery stuffs come to us from France. The stamped velvets are as remarkable for their soft rich colourings, as for their quaint simplicity of design; while the magnificent parti-coloured damasks, in velvet, satin, gold-threaded silk, and even real cloth of gold, might fitly have embellished the Venetian palaces in the palmiest days of the old Republic. "Muslin curtains," particularly the leno net, and Nottingham lace, and the so-called "Madras muslin," and "guipure," are in general as remarkable now for the delicacy of their geometric, or better still, their sprig-like design (which really thus affords some protection from too glaring a light) as they once were for their huge bouquets, and still huger plain spaces; but in the real hand-made Swiss lace there is often great room still for improvement. Chintzes have undergone a radical reform. The introduction of the French cretonne, in which the design was of a more Oriental type, and printed upon a stouter and unglazed cloth,

played dreadful havoc with the English chintz trade, until at last Messrs. Clarkson, the old-established printers, disinterred from their works at Preston and re-cut the blocks of some of the fine old Persian designs, which they now produce both as chintzes and cretonnes.

Of paperhangings we have already said a little. The English school has developed itself upon lines exclusively its own. Initiated with the neutral-coloured diapers and stiff conventional patterns that marked the reaction from the Chamber of Horrors epoch, it has received little foreign influence beyond the Japanese, which, particularly as filtered through the artistic mind of the author of "The Earthly Paradise," has resulted in that style in design of which Jeffery and Co., of Islington, produce the finest specimens. The house owes much to the taste and liberal energy of the present director (Mr. Warner), who has enlisted the talents of eminent architects and artists, and succeeded in bearing off prizes for the firm at Exhibitions galore. These papers—so absurdly christened "Early English," when they are more Oriental in feeling than anything else—are now not only seen in all the best decorative windows, and on many a wall throughout the country, but are largely exported to the colonies and the best American stores. There are two other forms of paper—essentially English—that deserve notice, viz., the highly-raised flock-papers for painting, made chiefly by the old Chelsea house of Scott and Cuthbertson, and the newly-invented material called "Lincrusta Walton." This last, indeed, is not, strictly speaking, a paper, but a kind of stamped linoleum: still it may fairly come within the category, and both these materials are eminently serviceable where richness of pattern is required to be combined with a quiet monotone in colour.

A striking contrast is afforded by the French paper-hangings, which were justly renowned for their beauty when ours were in the depths of ugliness. The "chintzes" of the old Maison Delicour, though artificial and Watteau-like in colouring, were yet singularly exquisite in their grace and softness, and we well remember some most lovely specimens in the Paris Exhibition of 1867. It has always been a mystery why these effects could not be produced in England, and the fact has been generally ascribed to atmospheric influence; for, many years ago, an enterprising English firm not only procured designs from the best French artists, but imported from Paris workmen, paper, size, and pigments, and yet was unable to attain the peculiar soft "texture" of the French production. With the waning of the taste for realistic design, these "chintzes" ceased to command a sale, and of late years the great house of Balin has been engaged, at an enormous outlay for machinery and skilled labour, in producing paper imitations of the finest old textile fabrics. Venetian, Genoese, and Early French damasks, tapestries, embroideries, velvets, and stamped leathers have been reproduced with a fidelity of effect which seems marvellous, when we consider the nature of the material employed. And although the high price of these goods, consequent on the cost of their production, necessarily restricts their use, and the purist may condemn them altogether as being a sham, still their great beauty attracts attention to many a shop-window that would otherwise be passed unheeded.

The progress and development of furniture production has not entirely coincided with that of decorative materials. The first revival of Gothic art consisted in a blind copying of its forms, without the slightest conception of their proper application; and even when Pugin (who had himself been one of the greatest of sinners in this respect)

enunciated in 1811 the "true principles," the Late Perpendicular period was still adopted as the great type and embodiment of Medieval architecture. Though less *bizarre* and impure than the corresponding period of Flamboyant that we meet with on the Continent, its decorative features are by no means to be taken as models; and over-elaboration of surface ornament, instead of the ornamental treatment of construction, will be found in even the best woodwork of thirty or forty years ago. As the great truths of architecture became more appreciated by the publication of Mr. Ruskin's "Seven Lamps," and "The Stones of Venice," and as the younger school of its practitioners "tried back" to the twelfth and thirteenth century work, so a ruder, though more truthful, style of make in furniture arose. But based upon carpentering and joinery more than anything else, it was heavy and ungraceful, and found little favour beyond a circle of extreme enthusiasts. As in decoration, so in furniture, Mr. W. Morris was a great pioneer in the adoption of forms in design and methods of workmanship such as characterised the best period of woodwork that this country has known—and this has been developed—the new "Queen Anne" school of furniture, which is peculiar to England at the present day. Its main features, as we now see it, are the extensive employment of turned work, and the restricted use of carving, the introduction into panels and plain services of decorative painting, stamped leather, and many other ornamental fabrics, and the adoption of a variety of woods that were almost unknown in cabinet-work a generation ago. In place of Spanish mahogany, wainscot, and rosewood, many of the most attractive articles of furniture are now made in American or Italian walnut, and ash, birch, beech, and pearwood (for ebonising), and polished or varnished pine. All these woods are both cheaper and easier to work than those formerly in demand; while the saving in material, due to truer construction and the proper use of the lathe and moulding-plane, allow of the expenditure of more upon design, and yet of a reduction in cost. As with decoration, so in furniture, no one can fail to observe the effect of Oriental importations, and Japanese cabinets and caskets have greatly moulded the best contemporary taste in these matters. While reverting to the practices of the early part of the last century, the Eastern spirit has given to the later Victorian furniture a special individuality of its own, which makes it quite a different thing from a mere reproduction of the true Queen Anne work.

But admirable as a great deal of our present furniture is, there are evident signs of an approaching change in style, and a return to more classical types. There is a fashion in tables, sideboards, and wardrobes, as in everything else; and as soon as any form of article—however good—becomes thoroughly hackneyed, the more proud and restless spirits chafe under imitation by their inferiors in the social scale, and crave for novelty and change. While, therefore, we find "Queen Anne" furniture of inferior make and finish turned out in vast profusion by the cheap advertising drapers, we notice among the best upholsterers a considerable introduction of Chippendale work—not only the old, of which large quantities exist, that are well worthy of cleaning and restoration, but new also, of excellent make and highly artistic design. In this, as in the Queen Anne style, although the forms are different, the same true principles of cabinet-work prevail; and it is upon the lines afforded by the eighteenth century, whether early or late, that our future school of furniture must in the main be formed.

Pages might be written upon chairs and sofas, did our space admit of it; but we must content ourselves with briefly remark-

ing that these necessary articles are now as commendable for their comfort as for their good taste. The "all-over stuffing," which came to us from abroad, was at one time the subject of the severest strictures from those who thought more of purism than of ease and luxury, but this has now accommodated itself to art principles, and leaves absolutely nothing to be desired.

Continental cabinet-work, the best of which is French, has very little in common with English, and is not much to be seen in London windows. Still, it is sometimes to be met with in the best shops, and a good deal of English work is made from French designs. There is one thing in which France has for ages differed from England—viz., in the possession of a traditional school in every field of art. Be it architecture, painting, or sculpture, music, literature, or the Stage, we find it the same; and partly owing to this fact and partly to the different genius of her people, she has always had a leaning to the Classic rather than Romantic. Hence she has been little affected—notwithstanding such men as M. Viollet le Duc—by the tide of Mediævalism that has done so much to revolutionise our own art-industries; and her best furniture is mainly a reproduction of the Renaissance, Louis XIV., Louis XV., and Louis XVI. periods, with the occasional use of the style of the First Empire. Their intuitive taste, and their feeling for arrangement and proportion, stand our excitable friends in good stead; and their furniture is often remarkable for its artistic excellence, to which the beauty and finish of the wood-carving contribute not a little.

One word more before we leave this subject—viz., on pianofortes. Why should these costly, but now indispensable, articles retain year after year their same deplorable form? The badly-carved "trusses" and "cabriole" legs, and those which leave the lathe with one part three times the diameter of another, have all been banished from the chairs and tables that are displayed in any decent window, but continue to offend us in instruments for which we have to pay 200 or 300 guineas, and many a well-arranged drawing-room is spoiled by the commonplace fretwork of the panels, and the gaudy, fluted silk behind it. No doubt the exigencies of piano construction are somewhat of a sealed book to designers in general; but there is no reason why this should be, if the makers would take the matter in hand themselves. A few attempts at originality we have seen, but they have rarely been successful. The English pianoforte-makers, however, are among the most conservative of mortals; and unless they bestir themselves, they will some day find they have to face as formidable a competition, from the more enterprising foreigner, in the appearances of the cases, as they have already to reckon with from the American "Steinways," and the "short iron grands" of Germany, in the matter of the instrument itself. Let them employ the talents of our best designers in conjunction with their own technical experience, and they will both deserve and earn the gratitude of those whose souls are attuned to "the concord of sweet sounds," but to whom also "a thing of beauty is a joy for ever."

J. G. LIBRA.

PAVING AND DRAINAGE OF STABLES.

THE St. Pancras Ironwork Co., of St. Pancras-road, have done good service in the improvement of stables and their fittings, and we have some satisfaction in calling the attention of our readers to a means for rendering stables and cow-houses less unpleasant and more sanitary. A small pamphlet, under the above title, discusses the subject in a reasonable manner. The writer recounts only what many have heard, that the effluvium of an old-fashioned stable is

wholesome, if not pleasant; that it keeps the horses in better health than a new one fitted with the latest improvements, and this notion largely prevails in country districts. It is almost unnecessary to say that such opinions are the growth of prejudice and ignorance, and the author shows that, why horses sometimes suffer in health in newly-fitted stables is, not because they are clean, but because the walls and plaster are damp. The old method of paving stables was by setting flint pebbles in sand. The joints soon became sodden with manure and urine, and the stable in time suffered from continual effluvia, from the saturation of the soil beneath. Every sanitary stable-builder knows the importance of a hard impervious paving that shall convey away urine as soon as possible, and the knowledge of this fact has led to numerous kinds of paving. The recommendations of the author are sound. A layer of concrete 6in. thick of lime or better of Portland cement is necessary for old and new stables; the sodden soil in the first case ought to be removed and the new earth well rammed before the concrete is laid. It is very necessary to give proper falls in the stalls and loose-boxes. The paving ought to be non-absorbent, yet not slippery, and the writer glances at various materials used for the purpose. Asphalt is slippery, however otherwise suited, and it is thought doubtful if its advantage over cement is worth the additional expense. Cement is clean, non-absorbent, and cheap; it must be laid carefully and with the best of materials, for it is apt to crack or break up. Wood blocks are porous, and found to be slippery; iron blocks are chilly to the feet; flagstones are liable to faulty joints, as is granite; and with respect to well-burnt bricks, such as Dutch clinkers, and the Adamantine clinker, the objections are that the chamfers and numerous joints impede the removal of liquids. With respect to the blue Staffordshire pavior, a similar objection is made: the cross-grooves check the flow of the drainage, and one set of grooves retains the dirt. The St. Pancras Company have brought out a brick pretty well known, which obviates the objections to clinker and pavior. The brick has one longitudinal groove only in the centre, and when these bricks are laid, a series of parallel grooves is formed, which requires only one direction of fall. The paving is easily swept in consequence, for there are no cross channels, and drainage is facilitated. At the end of grooves a gutter is placed, which leads to a drain-pot. As the grooves are made to run across the stall to a centre gutter, or diagonally, a good foothold is obtained, and for loose-boxes the gutters may be placed diagonally with a drain-pot in the centre, with intermediate ridges or water-sheds. To avoid cutting these bricks to any bevel they are made to any angle, and extra expense is avoided, and the grooves are round-shaped, not V-shaped, which holds the dirt. The Company have also considered the colour of these bricks, and they now supply a brick made from a clay which burns like terra-cotta, and is also gritty, of an orange or pink colour. Its size is 9in. by 4½in., and the flat surfaces are both scored by grooves, so that either side can be placed uppermost, or the paving reversed when worn on one side; the bricks are bonded together by stubs and corresponding grooves, while the price, we find, is the same as that of the blue-black Staffordshire pavior. The same company's open wrought-iron gutter, and their gutters with movable ribbed cover, with a cast-iron channel for drainage, together with the improved form of siphon drain-pot, are improvements in a sanitary direction leaving little to be desired.

ON THE EFFECT OF PROLONGED STRESS UPON THE STRENGTH AND ELASTICITY OF PINE TIMBER.*

By Prof. R. H. THURSTON.

IN papers read before the American Society of Civil Engineers at various dates,† the writer has given the results of investigations made to determine the behaviour of metals under loads of varying magnitude and under intermittent stresses, and to ascertain in what cases and under what conditions the variation, with period

of stress, of the normal line of elastic limits, discovered and announced by him in the year 1873, occurs in practice.

Experiments made by Mr. Herman Haupt,* forty years ago, revealed a fact not even now generally understood and appreciated—that timber may be injured by a prolonged stress far within that which leaves the material unimpaired when the test is made in the usual way and occupies a few minutes only.

Thus, using pieces 60 × 3 × 1 inches (152.4 × 7.62 × 2.54cm.) set as cantilevers with a breaking moment due the load, of $P l = 48 P$ inch-pounds (122P_m kilog.-metres) he obtained for the value of $R = \frac{6 w l}{b d^2}$ the

following figures:

Kind of Wood	R.	Time.	Remark.
White pine,	2272	10 minutes.	Injured.
"	1548	16 days.	"
Hemlock,	2824	5 minutes.	"
"	1629	16 days.	"
Yellow pine,	2848	5 minutes.	"
"	1800	16 days.	"
Locust,	5504	2 minutes.	Not injured.
"	3600	3½ days.	Injured.
"	2304	16 days.	"
White oak,	4248	15 minutes.	Not injured.
"	7200	15 minutes.	Injured.
"	3648	40 hours.	Not injured.
"	4088	48 hours.	Injured.

All samples tested were consisted good selected timber.

An extended series of experiments made intermittently in the mechanical laboratory of the Stevens Institute of Technology, Department of Engineering, during some years past,† had included an examination of this subject, and the result has confirmed Haupt's earlier work and has given a tolerably good idea of the effect of prolonged stress in modifying the primitive relation of stress and strain where the wood is good southern yellow pine.

A selected yellow pine plank was obtained for test, the history of which was known. The stick was cut at Jacksonville, Florida, in October, 1879, was received early in the following year and was piled in the yard, air-seasoning, until taken for test in the spring of 1880. The plank measured 4in. × 12in. × 24ft. (10.16 × 30.48 × 731.52cm.). When tested, it had been seasoning six months, the latter part of the time indoors.

From the middle of this plank a stick was first cut 3in. × 3in. × 2ft. (7.62 × 7.62 × 731.5cm.) and from this was cut a set of ten pieces from 40in. to 54in. long (101.6 to 137.2cm.) and from 1½in. to 3in. square in cross section (3.16 to 7.62cm.) square. These latter pieces were tested on various conditions, as then reported,‡ to determine the values of their moduli of elasticity and of rupture.

The moduli of rupture were usually 11,000 to 12,000 for the expression $R = \frac{3 P l}{2 b d^2}$ (in metric measure, 773.3 to 843.6) and the moduli of elasticity ranged from two to two and a quarter millions (in metric measure, 10⁶ × 1406 to 1581.75 × 10⁶). In specific gravity the wood ranged from 0.75 to 1.00, usually about 0.85. When kiln-dried to a moderate extent, the density was but little altered, if at all; but the modulus of elasticity rose to two and a half millions (1737.5 × 10⁶) and the modulus of rupture was increased about 20 per cent.

From the previously unused part of the plank a set of three test pieces was cut about 1in. (2.54cm.) square in section and tested on supports 40in. (101.6cm.) apart, to determine their breaking loads. The result is shown in detail in the appended table. In these specimens the annual rings were in the cross section of each piece, indicated by lines making angles of 45° with the edges. These pieces broke at 345,380 and 410 pounds respectively. The weakest piece broke by splintering, and had it been as sound as the others would probably also have sustained a somewhat heavier load. As will be seen by comparison with the other and with subsequent tests, the deflection of the strongest piece in the set is exceptionally small and the piece probably exceptionally strong and stiff. We may, therefore, take 375 pounds (170 kilog.), or a trifle over, as a good average for loads breaking pieces of this size.

Nine other pieces were cut and dressed to the same size and were mounted on supports

alternate weeks. These men work from 5.30 a.m. to 7 p.m. at the interior fittings, and clean dressings and pointing both inside and outside. During this time all the exterior gunmetal door frames and doors, window-frames and sashes, and window-shutters have been fixed, the external work being performed from cradles swung from the gallery at the summit. These are all of the most solid description; e.g., the entrance-door and frame, surrounded by the arms of the Trinity Corporation, weighs over a ton (2,382lb.), and the two doors of the storeroom—east and west, to be used according to the weather—with their frames weigh upwards of a ton and a half (3,682lb.), while the total weight of all the exterior doors, frames, sashes, and shutters is 5 tons 4 cwt. These are now all in position, being let into the solid masonry, bedded in red and white lead and oil, and secured by gunmetal plugs and countersunk screws. The whole is rendered watertight by all surfaces which meet being planed and polished. Considerable progress, too, has been made with the lightning-conductor, which consists of a copper band $1\frac{1}{2}$ inches in diameter and half-round. It is carried from the pedestal of the lantern, to which it is connected, to the entrance-door inside the tower. Between these two points it is let into the walls flush, all joints being lapped and screwed. To it are to be connected the gallery-rails, the metal floor of the lantern, the window-frames and shutters, the metal doors, iron partitions, tanks, ladders, lead pipes, crane, stove and stove-pipe, &c. From the entrance-door it will be continued down the face of the tower in connection with the metal steps to the rock below, and to low water to a distance of 12 feet from the face of the building, being let into and securely bolted to the rock itself. In case it should not be possible to effect a landing on the eastern side, a second series of metal steps will be placed on the western side of the cylindrical base of the tower. These have likewise to be connected by a separate conductor of the same size as that above described. The utmost precaution has been taken against the necessary ironwork being subject to rust. No galvanised iron is used, but all wrought and cast-iron of best quality is first thoroughly cleansed. In this state it is slightly and uniformly heated, and while hot well coated with boiled oil, and after being cooled and the coat hardened, painted. The lantern is the largest in the world, and of itself is half the height of the old tower. It is surrounded outside by a gallery 4 feet wide, formed by the last, the 89th course of stones, which are about the biggest in the building, being each about three and a half tons in weight. To this gallery are fixed the two cast-iron bell brackets, which are secured by means of "Muntz" metal bolts. These bolts have their two ends slit to the extent of about four or five inches, into which are placed the thin ends of metal wedges of corresponding length. The bolt is inserted into holes above and below just large enough at the entrance to admit it, but which increase in size inwards to an extent corresponding with the base of the wedge. When "driven home" the wedges penetrate the slits and expand the ends of the bolt, so holding the brackets firmly to the gallery course. There are six of these bolts to each bracket. Holes being filled in with cement for the stone and red lead for the brackets. These brackets are each a ton weight and seven feet in length, overhanging the gallery by three feet. It is to the extremities of these projecting portions that the fog-bells have been suspended. They weigh each over two tons—the western 4,480lb., and the eastern 4,627lb., they stand 4ft. 6in. high, and are 5ft. 1½in. wide at the mouth; and to lift them off the gallery, pass them out beyond the ends of the brackets, drop them down and hold them underneath the brackets while they were being fixed at a height of 130ft. above high water was a work which required care and ingenuity. It was successfully completed on Wednesday week, Mr. Elmond himself screwing the central bolt to each bell. The lantern is in the hands of men sent from Birmingham by Messrs. Chance, who have the contract for erecting it and fitting the lighting apparatus complete. The window-panes are diamond-shaped, 5ft. long by 2ft. 6in. wide, and the glass will be ¾in. thick. This is also the thickness of all the glass used in the upper part of the tower, while that in the two lowest rooms will be 1in. thick. It is all of polished plate-glass, bedded in white and red-lead putty. The lantern frame

is composed of steel diamonds, 3in. deep and ¾in. thick. The panes of glass are fixed from the outside by means of gunmetal strips, which are screwed to the outside of the steel frame. In case of breakage the strips holding any particular pane can be easily taken off and a new pane inserted, a supply of which will always be among the stores in stock. The egee iron rafters for the roof of the lantern are already fixed, and only await the arrival of the steel roofing-plates to complete the exterior of the building. It is fully expected that the exterior of the lantern will be practically completed by Thursday, October 6th. The total height of the vane upon the bell-shaped cap is 150ft. over the platform. Now that the cement has been cleaned off the external face of tower, it is seen that seven courses near the base of the tower are of Aberdeen granite readily discernible by their bluish grey colour, amongst the light grey of the Cornish granite used for the other parts of the work. A movement is on foot for utilising the new lighthouse as a station for signalling passing ships.

THE SAVOY THEATRE.

THIS theatre, which we have already illustrated, and which is advertised to open on Monday, Oct. 3rd, has been erected for Mr. D'Ojly Carte, from the designs and under the direction of Mr. C. J. Phipps, F.S.A., architect of the Gaiety, the Haymarket, Princess's, and other theatres.

It is situated on the west side of Beaufort-buildings, Strand, and occupies a site absolutely isolated on all four sides, thus affording free and expeditious entrance and exit for all classes of the public. The entrances are thus distributed, and are arranged so as to utilise the peculiar levels of the site: For the stalls and dress-circle, and all persons coming in carriages, the entrances are in Somerset-street, just off the Victoria Embankment. The pit is also entered here, and there is an entrance to the upper circle; the audience for both these latter parts can come direct from the Strand by a short flight of steps adjoining Beaufort House. In Beaufort-buildings also is an entrance to, and on a level with, the upper-circle. The entrances before referred to, from the Embankment, are on a level with the dress-circle, and a few steps lead down to the stalls and pit.

The gallery is entered in Carting-lane, a street in a direct line from the Embankment to the Strand. The royal entrance is at the angle of Somerset-street and Carting-lane. The stage entrance is in Herbert's-passageway. The box-office, for booking seats during the day, is situate close to the Strand, at the angle of the Beaufort-buildings frontage. The manager's offices are also entered from Beaufort-buildings.

The theatre is approached from Somerset-street, through a semicircular vestibule, paved with black and white marble, in which are the offices for booking and obtaining seats in the evening. Doorways immediately opposite the entrances lead to the dress-circle corridor, out of which wide staircases will be found on both sides of the theatre leading to the stalls. From this vestibule are also means of communicating by an ascending staircase with the upper-circle, and by pass-doors to the pit staircase. All the entrances, passages, staircases, are of fire-resisting materials; the flights of stairs are supported at each end by solid brick walls, and each staircase has a handrail on either side. There is no part of the theatre that has not two means of both ingress and egress, and the stage is separated from the auditorium by a solid brick wall, taken up completely through the roof. Water laid on from the high-pressure mains are in several parts of the theatre, and every possible means has been taken to insure both comfort and safety to the audience.

On the floor below the vestibule is a large refreshment saloon for the pit, and contiguous to it a smoking-room, opening out of the stalls corridor, with a separate boudoir lounge for ladies. There are also refreshment saloons on the upper floor of the theatre for both the upper circle and the gallery, with all necessary retiring and cloakrooms. The auditorium is thus arranged: On either side of the stage opening (which is 3½ft. wide by 32ft. high) are three private boxes on each of the three levels: these are divided by partitions and ornamental pillars, and are surmounted by an arch spanning the

whole width of the proscenium, springing from a cornice on a level with the gallery front. These boxes are richly upholstered in hangings of gold-coloured embossed satin. The orchestra is in front of the stage, and is of sufficient capacity for a full band of musicians. There are nine rows of stalls, on the level of the orchestra, seated to hold 150 persons in arm-chairs, with ample space allowed for passing between the several rows, and wide, unimpeded gangways on either side to the entrance-passages. Behind the stalls are six rows of pit seats, calculated to seat 250 persons, with a spacious open corridor behind for standing and promenading. Above the pit, but at sufficient height to allow of persons at the very back seeing the full height of the scenery, is the dress-circle, of six rows of seats, with armchairs for 160 persons; there are no pillars of any kind in the dress-circle, so a clear, unobstructed view of the stage is obtained from every seat. Above the dress-circle, but receding some 9ft. back from it, is the upper circle, seated to accommodate 160 persons in five rows. The amphitheatre and gallery recede 5ft. behind the upper circle, and will seat 400 to 500 persons in eight rows. In each tier the balcony front takes the form of a horse-hoe, that being the best adapted for perfect sight of the stage.

The ornamentation of these several balcony fronts is Renaissance in character, and is elaborately moulded and enriched with the figures and foliage peculiar to the Italian phrase of the style, and gilded. The ceiling over the auditorium takes the form of an extended fan, from the arch spanning the proscenium, and is divided into a series of geometric panels, richly modelled in Renaissance ornament in relief, of the same character as the boxfronts. Colour is sparingly used in the ceiling, the background of the ornament only being painted a pale yellow. The proscenium arch is divided by ribs into a series of panels, with gilded ornament over the proscenium; in the tympanum of the arch is a bass-relievo of figures and ornament upon a gold ground. The walls of the auditorium are hung with a rich embossed paper, in two tones of deep Venetian red. The seats are covered in peacock blue, plush being used for the stalls, and stamped velvet for the dress-circle. A gold-coloured satin curtain takes the place of the usual painted act-drop.

The stage, which is laid with all the latest improvements in mechanical contrivances, is 60ft. wide, by a depth from the footlights to the back wall of 52ft. There is a clear height above the stage of 56ft. for the working of the scenery, and a sink below of 15ft. Behind the stage, and occupying the whole wing of the building in Herbert's-passageway, are the dressing-rooms and offices of the management.

The theatre is fitted with a complete system of gas-lighting, but this is only for use in case of emergency: the whole of the illumination for all parts of the establishment being by means of electricity. This has been undertaken by Messrs. Siemens and Co., and the lights adopted are those introduced by Swan, of Newcastle, and known as the "Swan incandescent light," the power necessary to generate the electric current for so many lights being supplied by powerful steam-engines placed in a separate building, on the vacant land adjoining the theatre. These "Swan" lights are of a beautiful colour, and in no way impair the atmosphere of the theatre, and emit no heat: they are not of the piercing brightness of the electric light as seen in the streets and elsewhere, and therefore not unpleasant to the eyes. This is the first instance of a public building being lighted permanently in all its departments by the electric light.

The exterior façade of the theatre is in Somerset-street, facing the Victoria Embankment, and both this and the Beaufort-buildings frontages are built of red brick, with Portland stone for all moulded parts, and are Italian in style.

The contractors who have been engaged on the works are as follows:—Messrs. Patman and Fotheringham, for the whole of the builders' work, including stage; Messrs. Collinson and Lock have arranged the scheme of colour for the interior, and have executed the papering, painting, and gilding, and have supplied the upholstery and carpets; they have also modelled and executed the plaster ornamentation, in conjunction with Messrs. Geo. Jackson and Sons; Messrs. C. Drake and Co. have executed the concrete floors and staircases; Messrs. Faraday

and Son have made the internal fittings in connection with electric lighting; Messrs. Clarke, Bennett, and Co. have constructed the revolving iron shutters and blinds at entrances. Mr. J. E. Walker has been the architect's clerk of works.

PRACTICAL NOTES ON PLUMBING.— XIV.

By P. J. DAVIES, H.M.A.S.P., &c.

MAKING UP \square -TRAPS (Fig. 85).

IN the last chapter I have described the planning and cutting of good, reliable,

self-cleansing \square -traps; the following is a brief description of making them up:—

Having cut out the cheeks and band to the proper size, take the dresser and flatten the lead quite smooth; then place the cheeks and rasp the rounded edges true on to the other in order to have them the same size and square to each other, next soil them all over inside and outside as shown at M D H J N, Fig. 85; the soiling at H should be 2½ in., and at D from ½ in. to ¾ in., with the angles N P rounded. Next take a gauge-hook and shave round the inside lin. from M to D and from D to J, tone the shaving over, and do the other cheek. Now take the band, Fig. 86: this is the exact length round

the cheek, and the width of a 4 in. dip-pipe drawn to 2½ in. scale. First plane up the edges A E B F to the desired width and parallel. Soil all over the inside, then the outside, as marked out, then take the gauge and shave the inside of the band to the same width as you did the inside of the cheek, but on both sides. You now want a "trap-block," which is a piece of 3 in. deal, say 18 in. long by 11 in. wide, planed up smooth. It must, moreover, have something to keep it from warping. A good plan is to put two pieces of iron barrel through the centre of the stuff, and near to each end. Next lay the cheek inside uppermost upon this block, and, with two small clout nails, fix it there by driving the nails through just where the shaving will come when soldering on the top, as at the dots near H, Fig. 85. Take the prepared band and place the end (which, of course, should be square to the sides) to the heel of the cheek at M, and with a 2 in. wrought-iron clout or clout nail just driven nearly upright into the block, say, ½ in., to hold it in position; that is to say, the edge of the band up to the heel of the cheek. Now bend the band truly up round to the edge of the cheek, and fix it there by driving a few more nails into the block. Place a piece of board across the top of the band,

and a small weight to keep it there, and then solder up the trap, which is done as follows:—First splash on the solder round the joint, and then, with an iron (or if you are quick at soldering you can do without the iron), warm it up by working the point or ball into the solder from heel to out-go of the trap-cheek, then take a small "branch cloth," say, 2½ in. by 2 in. (see cloth table, Chap. 2), and wipe from right to left or left to right, as you choose, but do it at one quick sweep. Some plumbers wipe from about the centre or bottom of the cheek, and do it at twice. So may you; but the former is the quicker, and, as quickness is the principal part in wiping, it must be the best. Having one cheek soldered on, do the other in a similar manner.

Be careful that the heel of the trap is square with the band, and quite true or level; next, shave all round the outside of the top or body at H, Fig. 85, or L, 79, say, ¾ in. wide, and bore a small hole, ¼ th of an inch, as an air-hole, at just about J, or where the out-go will be; this is to allow the air to get into the trap. When it is cooling down after soldering up, this small hole is important, or the sides would be pressed in with the extra pressure of the atmosphere, owing to the interior air condensing as it cools. Now, having the body of the trap all ready for soldering to the top, prepare the top as follows. Take a piece of lead well flattened out, soil over the inside part and edges, also about three-quarters of an inch round the under-side of the edges, which, when soldered on the body, will be the top side. This prevents the solder uniting to this part of the lead while being soldered on. Place the body of the trap on the top, taking care that it is properly fitted, and, with the compasses, scribe all round the top, and ½ of an inch farther out, for the solder, as at K M, Fig. 87. Then remove the body, and shave this ready for soldering on. First look after the air-hole, then place the top on the block (which is all the better for being warmed), and splash on the solder. If you are quick you can splash on all round, and get up a good heat and wipe without an iron; but if you cannot do all at once, splash all round and warm up with the iron, and wipe off from right to left, commencing at the out-go corner. If you cannot manage to wipe it quickly enough this way, splash half at a time and wipe, but leave sufficient solder unwiped to begin again with when replashing, and keep this point in a fluid state; then warm up again with the iron, and finish, taking care to well warm up the solder where you commenced to wipe, so that it will not look rough at this point. Having wiped all round, trim the spare lead off the top, which would be all the better if you have an inch or so; but at any rate, trim it off square and true, or plane it off.

Next is the dip-pipe; this can be put in in one piece, or if you prefer it, in two pieces, by flanging the part that enters the trap, so that it will rest on the top, and make the other to go into this; in fact, make a flange-joint of it, as shown in section at E, Fig. 34. When soldering it in this way, it is necessary to paste some brown paper over the solder below, to keep it from falling off.

PLUMBERS.

The proper way to make plumber's paste is by mixing a spoonful of flour in cold water, and boiling it in a clean ladle until it is thick; cut the paper in long strips about two inches wide, and soak it before pasting.

PUTTING THE DIP IN \square -TRAP BEFORE SOLDERING ON THE TOP.

This method of soldering on the dip first is far the best plan, if you have a proper trap-block for the purpose, which is nothing more than having a hole cut in it to allow the dip-pipe to drop through; and if you arrange it properly for one trap, you can make the block the correct height for gauging the right depth of the dip that is to say, for 9 in. traps, the top of the block should be 5½ in. high—here you may put in the dip-pipe in one piece, or, if you like, you can solder on the dip-pipe from the underside of your top, which will allow the boards to go down with equal thickness over joists, but the evil attached to it is that this solder comes in the way when soldering on the top, and does not look so well.

BADLY CONSTRUCTED \square -TRAPS.

Fig. 87 shows the \square -trap not properly made for self-cleansing purposes. You will observe that the dip-pipe is away from the side, and consequently gives room for the fur to collect.

The bottom of the dip at F is also furred over; the principal cause of this is the urine. Even with the best-made traps this is likely to take place. I have an \square -trap quite full of this matter; but when plenty of water can be used, and the trap properly constructed, this formation of fur is greatly retarded.

(To be continued.)

PRESSURE OF WIND ON PLANE SURFACES.

MR. THOMAS HAWKSLEY, the past president of the Institution of Civil Engineers, has published some remarks on the pressure of wind upon a fixed plane surface, which have a more than direct application to the lamentable failure of the Tay Bridge. The author of the paper adopts a wind-pressure of 40 lb. per square foot, notwithstanding some reported results of anemometry. He says, "With regard to these observations, that the instruments in use are little better than philosophical toys, and that in general they afford no direct comparable or reliable indications of either velocities or pressures, and that they are often injudiciously placed as in some instance to record the effects of combined and therefore locally accelerated currents; whilst in other instances they record only the effects of obstructed and therefore locally retarded currents." We believe this opinion is well-founded, and that engineers have been misled by taking results which, do not at all represent the actual conditions of wind-pressure on a fixed structure of a certain height and position. Indeed, the allowance of a wind-pressure of 40 lb. on the square foot is, as the author observes, unknown in these islands, for this pressure would have overthrown many of the existing factory chimneys, as well as all the slightly-built erections on domestic buildings which have weathered many a storm. With regard to whirlwinds, tornadoes, &c., these phenomena cannot be measured, and therefore no engineer or architect could consider them in calculations of the strength of structures. Mr. Hawksley gives the general formula for the solution of the problem, and a table of pressures

is deduced from it. This formula is $p = \left(\frac{v}{20}\right)^2$ very nearly; p being the pressure of a fluid striking a plane perpendicularly, and then escaping at right angles to its original path, and v , the velocity of the current in feet per second. We may give a few of the figures in the table published by Mr. Hawksley. Thus, for example, a velocity of 20 ft. per second, or 13.6 miles per hour, gives a pressure of 1.00 lb. per square foot; 40 ft. per second, or 27.2 miles per hour, a pressure of 4.00 lb. per foot; 60 ft. per second, or 40.8 miles per hour, a pressure of 9.00 lb.; 80 ft. per second, or 51.4 miles per hour, 16 lb. per foot; 100 ft. per second, or 68 miles per hour, a pressure of 25 lb. per square foot. It is when the velocities exceed this that the wind-pressure becomes such a dangerous force; 120 ft. per second gives a pressure in lbs. per square foot equal to 36, a force sufficient to throw down many lofty erections with flat sides; while 130 ft. per second gives a pressure of 42.25 per square

foot, a gale which has very seldom swept over the British Isles, and which would carry destruction and havoc of a kind fearful to contemplate. Of course these pressures are assumed to be those against a fixed plane surface, and do not apply to inclined surfaces, such as roofs present. In this case the effect is diminished in proportion to the angle of the obliquity of the roof, and the pressure-formula above is modified, multiplying it by the sine of the internal angle made by the surface of roof and the direction of the wind.

Those engaged in the erection of lofty shafts, or towers with flat surfaces, and of extensive surfaces of wall, and girder bridges of considerable height, as well as the more modest erections exposed to the wind, will do well to consult Mr. Hawksley's paper, so as to give to their structures the necessary width of base or "moment of resistance." It is well to remember that the pressure acts at the centre of magnitude of the impeding surface in the case of flat walls, and it is to this point the maximum pressure must be applied in calculating for the required stability.

ACOUSTICS IN ARCHITECTURE.

"ACOUSTICS in Architecture" is the title of an exhaustive article written for Van Nostrand's *Engineering Magazine* by Mr. A. F. Oakey, in which the author broaches a theory based upon the acoustic properties of musical instruments, especially the violin, acknowledged to be the most perfect. The theory is not novel, though the author has applied the physiological principles of the subject, as laid down by Helmholtz and others, to modern buildings. We are now chiefly concerned with the results of the theory. Mr. Oakey very truly says, speaking of the principles of violin construction, we want the air in our halls, theatres, and churches, to vibrate in the same way; and that "hearing correctly is simply the movement of the air, in force and rapidity, being exactly the same when it strikes the drum of the ear, as it was when it received its first impetus." One of the first difficulties to be met is that of making a room or hall of harmonic proportions. A speaker can be heard at a greater distance in front of him than on either side, behind him, or vertically. Thus if 90ft. is the distance in front, 75ft. that on either side, 30ft. behind, and 45ft. vertically, any three of these dimensions constitute a harmonic proportion. Thus 6 : 2 : 3 is harmonic, being the ratios of the length and height, and the same may be said of any three of these numbers. A hall of harmonic proportion allows the sounds to be appreciated at all the points, and the author next considers how the opposite wall and its echoes must be dealt with to lessen the disturbing elements. The angles of the walls and ceiling and wall are particularly objectionable features, and must be avoided. Semicircular ends and coved cornices, or elliptical plans and ceilings like that of the Albert Hall, do not help sound, but produce reflections. In the last case, these occur at either focus of the ellipse; but if, instead of these curves, we suppose our room to have the wall opposite the orchestra curved to a gradual parabola, so that the focus is near the wall, and the cornice and wall be vertically half this same parabola, the result will be more satisfactory, for the curves will be analogous to those of a violin, and the reflections thus will be parallel to the axis. With regard to the tendency of sound to rise and the absorbing effect of the clothing of an audience, much can be done to overcome these difficulties by regulating ventilation, so that the currents of air should be towards the audience, and by finishing the walls and ceilings with a material to assist resonance or otherwise. The author thinks there should not be less than 6in. and if possible 9in. difference in the levels of the seats, so that they may rise in a gradual line, as in the lecture-hall of the University of London, where it has proved successful. With respect to resonance, it has been found that where the cubic feet of space for each person exceeds a certain proportion (195ft. is given by the author,) a resonant material becomes necessary, such as sounding boards of pine; when the proportion of space is less, hard surface like plaster is desirable, or in extreme cases stone.

The examples furnished by the author throw

little new light on this vexed question, and we think it is doubtful whether the most acoustically-defective room or building can be remedied by the adoption of the principles discussed. It is not always so easy to increase or diminish one or two dimensions of a room as the author thinks. If two dimensions are fixed, say, the length and height, the architect is often led by some other requirement than that of sound to fix upon a width; but in altering old buildings the difficulty is much increased. It is more practicable to lower a ceiling, if the other dimensions approximate, to the required ratio, and the proportions of 3 : 4 : 5 give a result in harmony with the theory. We may here give an experiment made by the author, in his own words:—

I remember doctoring a church in which the pulpit was placed at one side, so that the speaker threw his voice directly against a hard-finished wall opposite, and the ceiling was wagon-headed, that is, rising from the wall at an obtuse angle and forming another angle at half its distance from the centre, so that there were two rows of panels either side of the centre forming the ceiling and forming angles with each other and with the walls; these surfaces were also plastered in hard finish, and, consequently, the sounds were reflected from the wall, and again from the ceiling in a most complicated way, causing three distinct echoes at certain intervals that interfered with and rendered the exhortations of the preacher more or less ambiguous to those within certain distances, while those who sat at either end of the church heard a great deal going on without being able to distinguish anything. The organ was placed in a gallery at one end, and found great reinforcement from the wagon-headed ceiling. On measuring this church I found that it would only be necessary to lower the ceiling 2ft., alter the panelling to three panels on either side of the centre, finish them in hard wood, and make them form angles with the walls and with each other, so that their surfaces were tangent to the parabola I had used as a basis. Then to move the pulpit to the end opposite the gallery, make the pews face the pulpit, and the thing was done. Since this alteration one clergyman has preached to the congregation, who before were never satisfied with anyone for more than a few months.

The transmission of sound can always be checked by simple and inexpensive means. How often a house is rendered untenable by the noise of a school, or a strumming musician next door. The party-wall is generally plastered, and rarely more than a brick or a brick and a half thick. By nailing battens over the surface, and then lathing and plastering, the vibration of sound is checked by the air-space, for air is the best non-conductor of sound. Such "furring" on both sides would give two air-spaces besides the brick, lath, and plaster, and the space occupied is small. Of course floor-joists should never be allowed to bear on the walls, but be supported by sleeper walls or corbelling.

Turning to the illustrations of buildings given by the author, the original theatre at Lyons, built by Sulliot, in 1754, is mentioned as supporting the theory; its proportions were in the harmonic proportions of 4 : 4 : 3. The present theatre is said to be bad acoustically, and alterations of plan were made in it. Every one knows what an acoustic failure the Albert Hall at Kensington is; how draperies have been hung to prevent echo. No doubt the author is right in saying its defects result from the elliptical form there adopted. Its dimensions are 219ft. long, 185ft. wide, and 136ft. high; dimensions not in harmony with the numbers we have cited. Among successful buildings in England, the writer mentions the Free Trade Hall, Manchester, its dimensions being 130ft. by 78ft., and 52ft. in height, or with a unit of measurement of 26ft.—expressed by the proportion 5 : 3 : 2. The floor rises from the platform to the opposite wall, which is a flat curve, not circular. The angles of wall and ceiling are joined by a flat curve also, and a shallow gallery exists on three sides. Mr. Oakey cites the Boston Music-hall, by Mr. Geo. Snell, as the best example in America: the proportions are harmonic; and the Cincinnati Music-hall, from the author's designs, is also acknowledged to be perfect, acoustically. Its length is 200ft., height 80ft., and width 120ft., or 2 : 3 : 5. As this building exemplifies the author's theories, we may describe its plan. The shape of the hall, as built, is a spheroid with the stage projecting as a rectangle, and the seats are all arranged on curves. In the first design for the hall the shape is rectangular, but the choruses are placed within curved sounding-boards with the organ in the centre, the opposite wall is curved to a flattish sweep, and the seats are arranged in curved lines. Among other illustrations is the lecture-room of the University of London, in which the seats are planned

in a semicircle inclosed in a rectangular room, the proportion of which is 78 to 52. The tiers of benches rise, and the height is the same as the distance from front to back, or 52ft. This gives a ratio of 2 : 2 : 3. Her Majesty's Theatre in the Haymarket is instanced as a bad example: its plan, like that of other theatres, is a horseshoe (67ft. by 56ft.), the curve is circular, and there is no commensurate ratio discoverable. As we have hinted, the views, of which we have given the gist, are not broached for the first time, but the author has taken pains to put in a practical form the best theory we have. The subject is admittedly a difficult one, but he has endeavoured to present it in an intelligible manner.

CHIPS.

The style displayed in the distempers representing the Last Judgment, recently discovered in the Cathedral of Ulm, is said to be severe and characteristic of German art during the 15th century; they bear the date 1470.

The new buildings of Queen Elizabeth's Grammar-school, Alford, Lincolnshire, were opened on Tuesday week.

New schools have just been erected at Whitehall for the school board for St. George's, near Bristol. Mr. Stuart Colman, of the latter city, was the architect, and Mr. Bevan the builder.

Mr. Syme, of Watford and St. Alban's, has been selected as architect for a Baptist chapel and schools, about to be erected on Chalk-hill, Bushey, Herts.

A fine art exhibition is to be held in Inverness, opening on the 7th, and continuing over four weeks.

The Church College at Petersfield, which has been erected at a cost of over £13,000, was opened on Thursday, the 15th inst.

The success of the fine art exhibition at Cardiff is far greater than was expected, and it is now anticipated that after paying expenses £3,000 will remain to the credit of the free library.

New schools accommodating 360 children were opened on Wednesday week at Wribbenhall, near Bewdley. Mr. Robinson, of Darlington, was the architect, and Mr. Price, of Kidderminster, the builder.

While making improvements in the churchyard at Greenlow, N.B., the old market-cross has been discovered in the under part of the church-tower, which formerly constituted a part of the old county prison. The shaft and capital were entire, but the lion rampant, bearing the coat armorial of the Earl of Marchmont, with which it had formerly been surmounted, was absent. The cross has now been set up at the west side of the church-tower. It formerly stood in the centre of the market-green, but was taken down in the year 1829 to make way for the building of the present County Hall, and had since been lost sight of. It is supposed to have been first erected by the Earl of Marchmont in the year 1696.

The officers of the 2nd Queen's will place a stained-glass window in the east end of Stoke Church, Guildford, in memory of the late Sir G. P. Cooley, who was slain in the battle at Majuba Hill, South Africa.

The Sheffield town council have appointed a committee of inquiry to consider the advisability of purchasing the waterworks supplying the town.

The dissolution of partnership between Messrs. Bleakley and Murray, architects, of Birkenhead, and between Messrs. Lean and Hooley, architects and surveyors, Neath, Glamorganshire, is gazetted.

The Glasgow Archaeological Society last week visited Dumfries. The members who were able to join the party were received by the local Natural History and Antiquarian Society. After inspecting the "Siller-Gruu," the old bridge built by Devorgilla, the site of the monastery where Bruce killed the Red Comyn, and other places of interest, the party drove to Caclaverock Castle, eight miles distant, visiting on the way the grave of Paterson, the "Old Mortality" of Sir Walter Scott. A paper was read at Caclaverock on the family history of its proprietors.

The committee for the restoration of Tamworth parish-church, have accepted Messrs. Clarkson and Son's tender, £184, for the north chancel windows, and Messrs. Mitchell's tender of £255 6s. for the six north nave clerestory windows. They have decided to request Mr. Champneys, the architect, to make plans and specifications for the south window of the south transept, and directed that the necessary repairs to the sliding window be put in the hands of one of the builders engaged in the restoration.

OUR LITHOGRAPHIC ILLUSTRATIONS.

CHURCH OF THE SACRED HEART, EXETER.

We illustrate this week the west front of a new Catholic church, about to be erected in South-street, Exeter. Owing to the rapid fall of the ground, a narthex inclosing a short flight of steps was found to be the most desirable form of entrance. A lofty tower at the west-end of north aisle forms a baptistery, and is crowned by an octagonal lantern, which is to be constructed of stone, with a framed wooden roof, carried well down inside the octagon, and covered with lead, laid diagonally on small rolls. It is proposed to build the walls throughout of Poconestone, faced externally with grey limestone. The open-timber roof to nave is to be constructed with arched principals, framed into short hammer-beams, and carried down to springing of clerestory windows. The chancel, with its apse, has a groined ceiling, formed of oak-ribs and boarding. The arrangement of the chancel arch and narrow-side arches results from the chancel being planned narrower than the nave and this, with the side-chapels, which are separated from the chancel by a double arcade, will form a prominent feature in the interior. A gallery for the organ is provided in the south transept, reached by a staircase, leading from a lobby which forms an exit from the church in case of fire—this being a requirement of the local authorities. Mr. Charles E. Ware, Mem. Inst. C.E., and Mr. Leonard Stokes are the joint architects for the work. The drawing by Mr. Stokes, from which our illustration is taken, was hung in the late exhibition of the Royal Academy, and has already been noticed by us.

BUILDING NEWS, WESTMINSTER.

In our descriptive account of the Architectural Association excursion to Worcestershire last month we published some particulars of the Court House at Huddington, and at the same time gave a general view of the building as seen from the west, looking over the moat. Today we are enabled to give further drawings, illustrating the interior of the large room on the first floor known as the "Gallery," but now divided into two apartments and used as bedrooms, the building being in the occupation of a farmer. The west end of the multiphase, double-arched window, as well as the wall-painting here shown, have been recently removed by the Earl of Shrewsbury, and, we understand, are to be preserved in one of his own residences. These sketches, therefore, which Mr. W. N. P. Smith has given special value to, are of great interest to the building and

unrestored example of old English woodwork in situ, which has now passed away beyond recall. The other illustrations include a view of the Court House, taken from the garden in the rear, and some further details sketched by Mr. Maurice B. Adams. The main entrance occupies a central position on the north front, which is unbroken by any projection beyond the porch here shown.

SKETCHES FROM CARLISLE CATHEDRAL.

The history of this Cathedral, as is usually the case, reveals a long list of changes and rebuildings, and of injuries suffered at various times from war, fire, and religious bigotry. It furnishes, therefore, an excellent storehouse of the work of different periods. The sketches illustrated scarcely stand in need of any description. The newel, in the turret stair on the north side of the tower, is remarkable because of the way in which it has been cut in order to obtain a symmetrical vault at the landing where the varying widths of the staircase had flung it out of the centre. The outer section of the tracery of the circular window-lights I could not measure on account of its inaccessible position.—W. CANNING.

HAZLEHURST, ORE, HASTINGS.

This house, as it now stands, is the combined production of five or six architects, the original building having been added to at various times. Our illustration is taken from a drawing in this year's Royal Academy, and is intended to show the latest addition, that of a new drawing room and school-room, the one at either end of the building, with bedrooms over; besides these there have been various alterations in the internal arrangements of the house. The architect is Mr. W. Hay Murray, of Hastings, and the builder is Mr. James Stubberfield, of Ore.

DOCK MASTERS' HOUSES, ROYAL ALBERT DOCK.

Our illustration, taken from the drawing in the last Royal Academy Exhibition, shows the houses now being completed for the London and St. Katherine Dock Company, near the entrance from the Thames to the Royal Albert Dock. The walls above the base-course are of wood-framing, with plastered panels. The plain and ornamental tiles on gables are red, and the roof covered with Broseley tiles. The building has been carried out by Messrs. Perry and Co., Bow, under the superintendence of Messrs. Vigers and Wagstaffe, architects.

The death is announced of Col. Thomas George Glover, late of the Royal Engineers, Bengal, who for many years was engaged in the superintendence of public engineering works in India. In 1849 he was appointed an assistant executive engineer in the Public Works Department of the Punjab Circle. Soon after the pacification of the Punjab he was appointed officiating Garrison Engineer at Lahore, and at the outbreak of the Indian mutiny he was executive engineer at Bhirpore, to which office he was gazetted on the 6th of February, 1857. He succeeded in escaping to Agra, then the seat of Government in the north-west provinces, and in 1859, was appointed superintendent of the Western Jumna Canals, Punjab, with the rank of a first-class executive engineer, and was engaged in the construction of those great works of irrigation which have tended to the development and fertilisation of the northern provinces of our Indian empire. Eight years later Col. Glover was appointed a superintending engineer of the first class in the Department of Public Works, and retired some years since.

An accident occurred on Saturday week at the new deep dock now being constructed at Galway. The coffer-dam to keep out the tide from the site of the new dock had just been completed, and Mr. Prie, the principal engineer, was present, along with harbour commissioners and other members of the board, inspecting the work. Shortly after the labourers who had been working at the excavation inside the dock had left off, the tide swept away about 20 yards of the centre of the coffer-dam, and rushed in with a rapidity which would have caused great loss of life had the accident occurred half an hour sooner. As it is, the damage is considerable—amounting to about £2,000. The dock-work being carried out is estimated to cost £25,000.

A new schoolroom, 55ft. by 26ft., and 21ft. high, and several classrooms have been added to the Primitive Methodist chapel in St. Owen-street, Liverpool, and were opened on Monday week. Mr. Thos. Davies, of Herculaneum, was the architect, and Mr. Powell, of Egn-street, in the same city, was the builder. The cost was about £150.

THE "BUILDING NEWS" DESIGNING CLUB.

WE now have the pleasure of publishing our award for the past year, and we take first the names of those members who we think are entitled to receive the three prizes offered.

1st prize, £10 10s., "Jack" (J. Holdgate, Hillingham-road, Leigate, Surrey).
2nd prize, £5 5s., "Black and White" (Henry R. Goodsham, Bishop's-road, Victoria Park).

3rd prize, £3 3s., "Veronese" (W. B. Marsden, Promenade, Southport).

We highly commend the following competitors:—

"Popil J." (James B. Hkens, 30, Newstead-road, Liverpool).

"Cui Bono."

"Per" (Frank Bindloss, Cross-street, Manchester).

"Beta" (Christopher Clift, Woodbine-street, S. Shields).

"Nemo."

"Bonus Hominus" (J. H. Goodman, Bath-road, Tilthurst, near Reading).

The following are the names of six other competitors whose persistent efforts call for recognition:—

"Walter" (Walter A. Catlow, Humberstone-gate, Leicester).

"In Hoc Signo Vincas."

"Fidelis."

"Ephraim" (J. G. Sankey, Blackley, near Manchester).

"Yarra Yarra" (W. Lucas, St. James's-square, Cheltenham).

"En Avant" (Arthur L. Bradbeer, Worthing).

CHIPS.

On Saturday the memorial-stones were laid of a new schoolroom, which is being erected in connection with the Methodist Free Church at Redfield, St. George's, near Bristol. The plans were prepared by Mr. Wm. Thompson, of St. George's, and the building contract has been intrusted to Messrs. Williams and Peacock, who will complete it about January. The building, which is to be of a similar style with the chapel—Pennant stone with freestone dressings—is estimated to cost £1,000. On the ground-floor there will be one large schoolroom and a vestry, and above this there will be five classrooms, providing accommodation altogether for about 800 children.

The handsome house in Castle-street, Warwick, occupied by Thomas Oken, merchant, in the reign of Queen Elizabeth, and now known by his name, has just been restored and renovated. The work was carried out by Messrs. Dean and Son, of Warwick, under the supervision of the surveyor to the trustees.

Extensive works for the improvement of Coleraine harbour are being carried out under contract from the plans of Sir John Coode. The works include a new mole on the east side of the river, to form which, the commissioners have purchased quarries at Liffock, affording from 60,000 to 80,000 tons of stone.

The police commissioners of the burgh of Alva, N.B., have purchased the works and undertaking of the local gas-company for the sum of £7,000, under the provisions of the Burgh's (Scotland) Gas Supply Act.

The charity governors of High Wycombe have accepted the tender of Mr. W. R. Loosley, of Wycombe, amounting to £1,350, for the erection of the new grammar-school buildings, this being the lowest but one of twelve tenders received, which ranged from £5,667 to £1,197 10s. The architect is Mr. Arthur Vernon, of Westminster and High Wycombe.

The North-Eastern Railway Company have decided to construct a railway from Alwrick via Wooler to Cornhill, provided the land-owners in Central Northumberland agree to provide the land on the route of the proposed line on satisfactory terms. The line will be about 30 miles in length, and will connect the Alwrick and Kelso branches of the North-Eastern system. The same company is surveying the land for a proposed junction line from the terminus of the Tees Valley system at Middleton in Teesdale to that of another branch at Alston, a connection which would open up High Force and Cauldron Snout to tourists as well as a lead-mining district.

At a meeting held at Greenwich on Friday, it was decided to endeavour to raise £10,000 as a memorial to Canon Miller, and to erect with it a hospital in the rear of the Greenwich dispensary.

WAYSIDE NOTES IN THE WEST.

I HAVE just returned from a sketching excursion over ground traversed by me previously many years since in the counties of Gloucester, Monmouth, and Somerset: the following notes may be useful possibly to others on the same beat.

At Gloucester Cathedral, since my former visit, the two most noticeable changes are the chapel decorations by Mr. Gambier Parry, and the new pavement in choir. The first is as good as good can be, the latter as positively bad, a glaring mass of yellow glazed tile, the which, so to speak, rises and knocks one in the face. Yet so proud are the cathedral authorities of this gaudy, vulgar tiling, that it is not allowed to be walked on. So the interesting wooden effigy of the Crusader cannot go back to its right position in the centre of choir, and the public are obliged to content themselves with seeing the back of the tomb of Edward III. On Communion Sundays, I was informed, mats had to be laid down. To put a pavement too good to be trod upon is assuredly a gross absurdity; but in this case the folly is at a climax, inasmuch as the pavement is not good, would not suffer by being walked on, and if scratched and worn would look all the better for it. Whilst this pavement is so tenderly considered, the painting I have referred to receives no care or protection, though a work of great beauty. A slight barrier should certainly be fixed round it, to protect against the carelessness or mischievousness of the gaping crowd who, ignorant and unappreciative, press into the confined space.*

The very interesting church of St. Mary de Crypt is in the builders' hands. I hope there is but little money to spend.

Mr. Gambier Parry's celebrated decorations at Highnam Church have been for some time at a standstill. A great pity; but if he continues the work I would strongly urge the necessity of having less-glaring glass in the windows. Their high colouring shuts out the light required, and must of necessity make the mural decoration look weak and poor; from an art-point of view, too, the windows must be condemned, not being in good style. The glass most fitted to accompany wall-decoration is that of the windows of Merton College, Oxford. Glass-painters, I would remark, after groping about in the dark for the last fifty years, begin now to see the need, not of displaying ultra-extravagance of colour, but of strictly subordinating it, introducing a large amount of white glass. It is never too late to mend, but it is extraordinary how slow people are in learning.

One can never see Chepstow Church without bitter regret at the stupid alterations which, under the name of restoration (hateful word), took place about forty years ago. I think it a pity architects should be paid for Church restoration. Certain it is that the 5 per cent. system is a bad one. There are few architects but will make work for themselves under the temptation of this inducement, and so our ancient relics are sacrificed. In the castle I found that the beautiful little 14th-century chimney-head, shown in Parker's "Glossary," no longer exists. It had been, I was told, blown down, and no remains preserved. The original stone seat of the Gardirobe, I found, had been forced out of its place and broken—a most unwarrantable act of violence. These who are answerable for it should be made reinstatement. No danger of sewage-gas or typhoid-fever with such arrangements as this—projecting over the river at a height of a hundred feet.

The Post-Office, Chepstow.—The architectural visitor will be gratified to find that this best of modern institutions is situated in a large vaulted apartment of Edwardian date, it being

the undercroft of a Mediaeval merchant's house, a singular conjunction of two widely different phases of civilisation.

At the churches of Tidenham and Llancaut, both in the immediate neighbourhood of Chepstow, may be seen lead fonts of very ornamental character, of, probably, 12th century date, and apparently from same mould. These are the only lead fonts I have met with.

Tintern Abbey I found in anything but an improved state. The pretty mountain ash which, with its graceful foliage and scarlet berries, used to be at this time of year such an ornamental object, screening the blank wall of north aisle, has been cut down—a foolish and unnecessary act, as also the stripping off the west gable of the beautiful mantle of ivy with which it had been so long adorned. The worst thing done, however, is the removal of the lower part of rood-screen, situated in the nave, a bay westward of the Crux. This was one of the marked features of the interior. This was swept away. I was told, "in order to have a smooth uninterrupted walk," and that "the effect was a great improvement!" Benighted ignorance! The field on the south side is now shut up, so that students of the beautiful can no longer inspect the exterior, south or east. The remains of the rood-screen, if in existence, should be replaced without delay. Such destruction is a mischievous falsification of history, wanton and inexcusable. Remains of a fine plastering (it might be whitewash) seemed to have covered the whole of interior. I remember when there was much of it; now there is scarce a vestige, and with it has gone the remains of mural painting, which was observable over altar in south transept.*

The railway has quite spoilt the place in my estimation. The *genius loci* must see with affright the turbulent, noisy crowd of cheap trippers which troop through the place. The railway company last week set themselves to make a profit out of poetic sentiment, by tempting excursionists to a night visit to see the Abbey by moonlight! The previous night being beautifully fine, many persons went. However, the genius of the place had revenge on those who thus rudely profaned her haunts. The moon hid herself in clouds, and heavy rain sent away the foolish crowd in a drenched condition to their distant homes.

The two 13th-century chapels at Tintern have been both restored, but not satisfactorily. An ivied ruin by the roadside has, I find, been pulled down—a pity. About five miles from Tintern, on the Monmouth road, is the little-visited village of Trellic. It is worthy of notice, possessing Druidical stones, an earthen fortress, an interesting 13th-century church, with cross in churchyard, and at its base two early tombs—the only early monuments I have met with in a churchyard. The clerestory of church, since my former visit, has been rebuilt in part, leaving out the lancet windows though they are gone. The church is in a very neglected state, and no funds forthcoming for repairs. The great farm of the place, upon which I suppose the rate would be levied, has been, I was told, vacant for years! Local tradition says this place once possessed seven churches, and that a wayside cross, now half a mile from the village, was at one time a boundary mark. About a mile nearer Monmouth, alongside road are other Druidical stones, or, what seem to me such—but I have seen no reference to them in books. Of Monmouth Castle but little remains. I had hoped to have seen here the cradle of Henry V., figured in Liborte's "Arts of the Middle Ages." I was told it had been sold to a gentleman near Bristol. The interest of the cradle to me is this, that so far as I know, it is the only specimen of English Gothic domestic furniture in existence. A strange fact. I exclude chairs which are preserved in churches, as not being domestic. What purports to be Mediaeval furniture is, none of it, older than Elizabeth. Mr. Street is engaged at Monmouth in transmogrifying a Classical church into a Gothic one. The other church has been restored in the Norman style, most horribly. The old bridge with its gateway is a delightful bit.

All architects and artists should see stately Raglan. In picturesque beauty it is unrivalled. A pity that the commercial spirit is so dominant

* This church has a fine lofty proportion. The preference shown for arches with centres below springing is remarkable. The solid stone screen which shut off the aisles is noteworthy.

with the custodian, giving the place the character of tavern and tea-garden. The modern slate roof at the side is a sad blemish to the landscape. Newport Castle will, I hope, be looked after by local friends. Though humbled to the uses of a brewery, the remains are worth preservation. St. Woolas Church, Newport, is an enigma. The west wall, with its remarkable doorway, is probably early 11th-century. Westward of this was built, in the 13th century, a chamber, say, 60ft. by 20ft.; and again, west of this, stands the tower, of Perpendicular date. Now, what was the intention of this singular building? It is now called a Lady-chapel, but chapel it was not, for there is no sign of altar, the west doorway of church occupying the altar place. I suppose it was for sepulchre, as there are recesses in side walls. The thing is, however, unique. The floor of this chamber slopes down eastwards.

The Roman city, now Caerleon, is very disappointing. It was a place of importance, but little vestige remains. From the rarity of Roman architectural remains in this country, the Doric columns in museum here are, therefore, proportionately interesting. The person in charge, however, insisted upon these being Norman!

Caerwent, about five miles off, also Roman, has much of its city wall left. The south side is said to have been washed by the Dristol Channel, now some miles distant. The retreat of the waters probably accounts for Newport and its name, from Caerleon being the old port. The same cause in modern times has resulted in the necessity for the Gloucester canal.

A singular thing has happened in respect of this wall at Caerwent. A block of it in solid mass, about 15ft. square, has been thrust cut of position and thrown over. I could not hear how or when this happened, nor can I form any probable theory on the subject. Respecting a Roman pavement lately discovered, I, on inquiry, found it to be in a cottager's garden. The space uncovered is about a fourth of a design formed of a circle in a square, with lesser panels of hexagon shape, with figures of fishes, &c. This piece is about 6ft. square, of fine design and workmanship. The cottager did not, she said, intend to uncover more, as potatoes were of more consequence than pavements. Her aunt, I found, had also a pavement in her garden now covered with a potato-crop, so I could not see it. As the latest discovery was being trodden to pieces, I recommended it being covered forthwith. It was only a few inches under surface, and I wonder it had not been destroyed by digging over it long since. A couple of "flower pots," as they were called, had lately been unearthed in another place. These being left about, were broken. I could only see the upper part of one, a double-lipped Roman vase of black clay. Many pavements and curiosities have been found here and sent to Caerleon Museum, re-covered, or destroyed. Considering these works of art have been so well preserved for some sixteen centuries, it is sad that now they should be so little appreciated. There is probably much here that is interesting, but the natives care nothing for such things.

Caldicot Castle I did not find altered. In the keep Mr. Parker thinks that the hole in recess gives access to the dungeons. It appears to me to be clearly the well, which was a necessary adjunct to the keep; without it, the keep would not be long kept. The well was commonly in a wall. In the centre compartment, south front, there appears to have been, in a singular manner, a sort of canopy head to the upper windows, but the projecting part is in no instance remaining. I do not know what this could have been. Mr. Parker thinks that the interior buildings were constructed of wood; but there are visible in the turf plain indications of wall-footings, and where stone was at hand, it is not likely wood would be used in preference. The parish-church is good, of 13th, 14th, and 15th centuries. The west window of tower is decorated, and of singular shape; there is no arch to head, but the jamb follows the shape of the tracery. Another instance of this exists at Tidenham, probably by the same designer.

Berkeley Church is a charming 13th-century example, with interesting Perpendicular chapel of the Fitzhardinges attached. It has happily escaped mutilation. The belfry is detached—a Perpendicular tower at extremity of churchyard—probably for the reason that if connected to church it would, in possession of an enemy, be

* Gloucester Cathedral, though it passed through the hands of Sir Gilbert Scott, has happily retained its choir screen with organ over. Though people blame the destructive acts of Wyatt, at Salisbury, in making the Cathedral interior open, regular, and uniform, his mistaken ideas are very generally held. Pictorially our Cathedrals are much injured by the removal of the rood screens and organs, concerning which Sir Gilbert was right. In respect of the organ, it was the early position or it, and the best place for being heard, and its generally good outline made it, with the screen, an important and artistic break in the general view. In a clear open space is the essence of beauty, why not build a simple parallel? It is the numerous breaks, divisions, and subdivisions by aisle, arcades, screens, &c., which make a Gothic church so interesting. Remove these and the interest fades away. I hope Gloucester will long remain in the restorer's and improver's clutches.

dangerous to cast it, over which it would look.* The Castle is surprisingly perfect. The Norman keep incloses a large piece of ground. The Decorated hall is still daily honoured by its lord dining there. This is probably the only instance of such permanency, the owner being a lineal descendant of its first builders. But few of our nobility are of families old enough to have halls, and those which possess them now got them sideways. It is a pity the old style in this case is not perfectly kept up—the dais is not used. There a late fireplace commands the situation. Originally, no doubt, the fire was in centre of floor. In the death-chamber of Edward II. is a bedstead, said to be his. This is one of the common blunders previously referred to. It is of Elizabethan date. The chapel is perfect and remarkable, and is also in use. The Chinese bell in fore-court is a large and astonishingly fine casting. It is covered on exterior with small characters. With all our advantages in this country, it would be impossible, I am sure, to produce anything like this. There are some interesting old houses in the town. The eccentric arch to doorway of porch reminds one of something similar at Bristol Cathedral and St. Mary Redcliff. It is an arch and not an arch. The head is formed of five pieces of stone, the top and bottom sides being parallel.

Thornbury Castle has been made habitable, and is, therefore, not as accessible as heretofore. The beautiful brick chimneys are remarkable in a stone district. They could not have been made anywhere near. At Hampton Court was building the same time as Thornbury Castle, it is not unlikely the Duke of Buckingham would get the idea and the chimneys there.† The eccentricity-planned projecting windows of the hall show how the Mediaeval designers could play with their work—making difficulties for the pleasure of meeting them.

When before at the church here, I sketched some good old bench ends. All are gone, now replaced by new seating with *mouth-bags tongue*—a wretched, modern trick, as hateful as the silly V-jointing which some ignorant people are so fond of.

The moroseness of its proprietor prevented my inspecting remains of Bristol Castle. I was, however, much pleased with the excellent condition of Norton's house in Peter-street, and the civility with which my wishes were there acceded to. I was glad to see the remains of Norman House so well preserved at the Guildhall.

St. Mark's Church, otherwise the Mayor's Chapel, was *restored*, after a fashion, some 50 years ago. It is a pity a discriminating and wise re-restoration is not entered on now. The Early English work is of fine quality. The singularly high situation of windows points to roofs of other buildings below them. Now that the City School is demolished, which shut in one side, it is to be hoped care will be taken that the side be not either covered up or permitted to suffer from wanton violence. Local architects should look out for vestiges of the old hospital. This is the only church I have met with standing north and south. The beautiful little chapel now used as vestry should be better cared for. Its tiled floor is most singular. A notably fine E. E. bracket stands against south-east pier. The two altar-pieces here, with large side niches and panel in centre, were a favourite composition. The same may be seen at Wrington Church, and several others in the neighbourhood.

At Berkeley Castle I and my companion were charged half-a-crown for admission. I much dislike the enforced payment now getting general. The supposition that the proprietors pocket this money is not complimentary to them; and the mischief is that the servants all look hungrily for fees just the same. For a visit to Cobham I was lately charged eight shillings at the shop in Rochester for myself, wife, and two children, and then felt bound to fee the house-keeper. As I was the only one of the party who felt interested in the place, this outrageous charge, with other expenses, heavily handicapped my pleasure. This is a matter the *nobility* of England should amend. M.

* The ground on which the castle has suffered greatly from damp. I would advise the use of the silver water-colours for such purposes.

† These are the only chimneys in the country which are a modern article, and which put to a whole class of them.

THE RETABULUM IN WESTMINSTER ABBEY.

IN a letter to *Notes and Queries*, "H.P." raises the question, Who was the first discoverer of the retabulum which is now exhibited at the back of the sedilia in Westminster Abbey? He says—"I have access to Mr. Willement's copy of J. P. Neale's 'Abbey Church of St. Peter,' in the fly-leaves of the first volume of which the excellent antiquary and herald has inserted, first, a sketch of the gravestone of William de Valence, which was found under the step of the tomb of King Henry V. and in the floor at the east end of the shrine of the Confessor. This is dated 1551. Secondly, a list of three children of King Henry III., and of nine children of King Edward I., copied from Sandford, all of whom, dying young, were buried in the Abbey. And thirdly, a slip of the leaf of an archaeological work, with an extract stating that 'Mr. Blore, surveyor of Westminster Abbey, on his survey found that the roof of the case in which the wax figures of Queen Anne, the Earl of Chatham, and what is commonly called the ragged regiment, were placed, bore marks of ancient ornament. Having it removed, his surprise was only equalled by his joy at finding it one of the most curious specimens of ancient art at present in existence. With that zeal for the preservation and repair of his church which so distinguishes the learned Dean, this curious remain has been removed to the Deanery till it can be restored to the Abbey.' It was about 1851 that this discovery was made, and I think it highly probable that the paper was written by Mr. Willement himself. I read also in one of the late Mr. Burges's valuable contributions to Sir Gilbert Scott's 'Gleanings from Westminster Abbey,' 1863, as follows:—Some twenty years ago Mr. Blore, who was the architect of the Abbey, had the good fortune to discover, on the top of the waxwork cases in the upper chapel of Abbot Islip, the very beautiful specimen of 13th-century decoration which is now placed at the back of the sedilia over King Sebert's tomb. Moreover, I have lately come across a paper dated July 10th, 1817, by Mr. John Carter, F.S.A. After commending the waxen portrait and dress of King Charles II.'s effigy, he says—'In a box inclosing other royal wax figures in Islip's chantry, has been substituted, by way of covering, some compartmented work of small mosaic ornamental carvings and paintings of figures, of a design so delicate, an execution so exquisite, that an absolute view alone of the same, and that with the utmost attention, can give the least idea thereof. No hesitation need be made, when it is affirmed, that it must have been a small portion of the highly estimated shrines that once rendered the scenic display of the interior of the pile so shining and glorious.' It must be a matter of astonishment that four such men as Blore, Willement, Scott, and Burges should have been unaware of this early discovery made by John Carter, one of the worthiest and most renowned of their predecessors. But it is not even now too late to 'give honour to whom honour is due'; and the writer hopes that this now historical fact will not again be entirely ignored."

CHIPS.

A system of tramways is being laid throughout the town of Warwick, and is now almost complete. The space between rails in the centre of the town is laid with Woodward's molten iron stone blocks, and that beyond with macadam. Mr. Fell is the contractor.

A new porch is being erected at Lutterworth parish-church, from designs prepared by the late Sir Gilbert Scott. The builders are Messrs. Lane and King.

As an experiment Mr. Rex, the post-office surveyor for the Eastern Counties district, has caused the apertures of the wall-boxes in the neighbourhood of Cambridge to be encircled with luminous paint.

A new Congregational chapel was opened at Sulhamstead, near Reading, on Tuesday week. It is built of red brickwork, seats 130 persons, and cost £750. Mr. W. Ravenscroft, of Reading, was the architect.

At Langton-on-Swale, near Northallerton, a chancel, tower and vestry, just added to the church built in 1877, were opened on Thursday in last week. The work has been carried out by Mr. Place, of Langton.

Building Intelligence.

BLOOMSBURY.—A new middle-class school for 200 girls was opened last week in Chenies-street, Tottenham Court-road. The new school and its playground occupy a corner site about 70ft. square, of which about one-half is built upon, the remainder being an open playground. The building is, inclusive of the basement, five stories high. The teaching department is entirely on the ground and first floors, and consists of five classrooms, each holding 40 children. Three adjoining classrooms on the first floor have been so constructed with movable partitions that they can be thrown into a single apartment about 66ft. by 22ft. Each separating partition consists of three widths, the two side widths being large doors, folding back against the walls, the central width a thick sound-proof revolving wood shutter, sliding up and down in grooves on the edges of the closed doors. On the first floor there are three sound-proof music practising rooms with double doors; and on the basement, level with the playground, are luncheon-rooms for pupils and teachers, cloakroom, and lavatories, &c., and kitchen and living-rooms for the caretaker. The second floor is devoted to the head-mistress, and the third floor, in the roof, forms a large winter or wet-day playground, which will be fitted with suitable gymnastic apparatus. The exterior of the building, which is faced with red bricks and red Mansfield stone dressings, is an adaptation of the French Early Renaissance style, the high-pitched slated roof containing the second and third-floor stories. The architects are Messrs. Davis and Emanuel.

BRIGHTON.—A new vicarage has just been completed in connection with St. Mary's Church, Brighton. It has a fine site immediately adjoining the church, at the corner of Upper Rock-gardens, and is built in red brick with white moulded brick strings and panels (from Mr. Jas. Brown's works, Braintree), the upper story being hung with ornamented tiles and the roof covered with dark brown tiles. It has very full interior accommodation, and has cost about £3,000 (exclusive of site), the contract having been efficiently carried out by Messrs. Lynn, of Marlboro'-street, Brighton, under the direction of the architect, Mr. Spencer W. Grant, A.R.I.B.A., of 63, Finsbury-pavement, E.C.

COWFOLD.—Some ten years ago a community of Carthusian monks arrived from France and settled at Cowfold, Sussex, on a spot which, by a happy change of the original name of the estate, they called Parkminster. They shortly afterwards began to build a new monastery—the first Carthusian monastery erected in England for 300 years—which is now nearly completed. Erected in a somewhat severe style of Norman architecture, it has, the *Tablet* says, the merit of solid massiveness and grandeur. It is entered by a gateway leading into a quadrangle, in the centre of which is the church, an imposing structure, with a tower and spire at the east end, 200ft. high, and two turrets at the entrance 110ft. high. Its dimensions are 150ft. by 20ft. The height to the ridge of the roof is 80ft. It is divided by a stone screen into two equal parts, one for the choir monks, the other for the lay brothers. Besides the church there are a large chapel of the relics, chapter-room, and twelve small inclosed chapels. The two sacristies are panelled in pine, and contain presses for the vestments and other fittings. There is accommodation for thirty-six monks, each having sitting and bedroom and two other rooms, in which they can exercise themselves in any manual labour, such as carpentry, carving, &c., and a small garden is attached to each of the cells for out-door exercise. The proportions of the quadrangles (of which there are four) are immense, the largest being 410ft. by 370ft., being larger than the quadrangle of Christ Church, Oxford (261ft. by 261ft.), or of Trinity, Cambridge (314ft. by 325ft.) hitherto considered the largest in England. One of the corridors of this quadrangle extends to 600ft. The whole exterior being now finished, and the interior fittings being already proceeded with, it is probable that St. Hugh's Monastery will be solemnly consecrated next year. The work has been carried out under the supervision of M. Norman, a French architect.

DELABOLE.—A new church has been built

adjacent to the celebrated slate-quarries of Delabole, Cornwall. Early in character, it consists of nave, south aisle and chancel. The walling is of local slate, with granite dressings; the roofs are covered with Delabole slates also, and the same material is used for paving the aisles. The chancel-floor is tiled. The roofs are of open timber; that of the chancel is ornamented by carved angels. There is an oak lectern and chancel-stalls, &c., of the same material. The font is of Beer stone. It is by Mr. Harry Hems, of Exeter, who also did the general carving, and supplied some of the chancel fittings. The glazing is of cathedral glass. Designed by Messrs. Hine and Odgers, architects, of Plymouth, the contract has been carried out by Messrs. Westlake and Cann, of Camelford.

HEREFORD.—The new Dispensary in Union-street was opened on Tuesday week. It has been erected from the joint designs of Mr. Lewis Powell and Mr. Thomas Davies, and the style is Classical Italian; the street elevation is designed in two orders, the lower part being the Roman Doric, and the upper part the Ionic. The pilasters and dressings are in Beer stone; the friezes and entablature in red Worcestershire (Hoverley) stone; and portions of the pilasters are of the same material. The walls are of the local stone from the Three Elms quarry. Right and left of the entrance are the consulting rooms, and the end of the vestibule opens into a large waiting-room furnished with seats, having at one end the dispensary, and at the rear are closets and other conveniences. In the upper story is a large board-room and a smaller one. Underneath the ground-floor are spacious cellars for storage, which are fitted with hot-water apparatus. The sole contractor is Mr. W. Bowers, builder, &c., Bath-street. The cost of building and furnishing has been £1,000, exclusive of site.

KNUTSFORD.—The new church of St. Cross, Knutsford, was consecrated on Wednesday week. It replaces the church built on the same site as lately as the year 1855, but which fell two years since into a dangerous condition, owing to the breaking of the roof and the consequent outward thrust of both side walls. The designs of the edifice just erected were prepared by Messrs. Paley and Austen, architects, Lancaster, and the contractor was Mr. Hamilton, of Altrincham. The cost is £4,000. The church is of brick and terra-cotta, supplied by the Knutsford Brick and Tile Company, and consists of nave, transepts, chancel, tower, vestries, and porch. Its total length is 120 ft. The width of the nave is 23 ft., of the transepts across nave 52 ft., and of the chancel 24 ft. The tower, 81 ft. in height, is fitted to carry a full peal of bells. The building is seated for 315 persons, with pitch-pine benches. The roof is half-ceilied. The walls are coloured to dado height, and above that are of red brick. The chancel is separated from nave by a metal screen with gates. Eastward of the chancel is the sacarium, with sedilia, credence table, and the altar, standing under a five-light tracery window, filled in with stained glass, illustrative of incidents in the life of Christ. The window was furnished by Mr. Forrest, of Liverpool. The alabaster font was made by Roddis, of Birmingham. The central part of the reredos is chiefly of wood, carved by Mr. F. Armitage, of Bowdon. The side portions are formed of panels, with raised margins of sage-green plush, and compartments embellished with handsome crewl work.

MANNAMÉAD, PLYMOUTH.—The church (of which the nave and aisles were erected 11 years ago) has just had a fine chancel and transepts, with organ-chamber and vestry added, from the design of Messrs. Hine and Odgers, architects, of Plymouth. Of Late Decorated style, the new work blends well with the earlier portion, and a dignified church is the result, the effect of which will be greatly enhanced when the proposed south-west spire becomes an actuality. This spire will be 150 feet high, and will cost £1,700. Lofty in design, the new chancel is built of blue limestone, with dressings of Portland and Bath. The roofs are of steep pitch, covered with slate. The crosses are prominent features, and of wrought iron. The east window is kept well up, and is a five-light one. Mr. W. Morris, of London, is at present painting the glass for this window. The other windows all display flowing tracery heads, and are filled with Geometrical cathedral tinted glass. There is an entrance in the south transept. The open-

timbered roofs are of pitch-pine. That of the chancel springs from 14 large sculptured stone corbels. These represent angels in adoration and with musical instruments. The church contains other figure-carving in stone, and the blocks left at the time when the first section was built have been carved during the present works. This work has been executed by Mr. Harry Hems, of Exeter, and his staff. The internal walls are stuccoed; they have a pitch-pine dado round them the height of the seating. This latter is generally of pitch-pine, but the stalls and the pulpit are of carved oak. The avenues and chancel-floor are laid with encaustic tiles, the chancel rising three steps above the nave. The lectern is of brass, and there are brass standards for the gas. These gas-fittings are by Messrs. Hart, Son, and Peard. The church is heated by hot water. Mr. Blowey, of Buckland, was the contractor.

NORTHAMPTON.—A new chapel at the Convent of Notre Dame, in Abingdon-street, Northampton, was opened on Wednesday week. It forms the end of a quadrangle approached from the street through a passage, and is built of white pressed bricks, with Bath-stone dressings, thus presenting a striking contrast to the red-bricked buildings on either side. It is in the Decorated Gothic style. The gabled front is approached by two flights of thirteen steps. The entrance is through a porch having at the apex a figure of the patron saint to whom the chapel is dedicated—St. Joseph. The projecting porch forms part of an outer vestibule extending across the front of the chapel, and communicating on each side, by means of passages, which will be covered in, with the main building. In the front of the chapel proper is a large window of five lights, the upper part being filled with rich circular tracery, having in the centre a quatrefoil filled with stained glass, representing the Agony in the Garden, and presented by the workmen as a memorial of the good-feeling that existed between themselves and the Sisterhood. The gable has buttresses on each side, with octagonal turrets, and the apex in the centre being surmounted by a Maltese cross. Within, a gallery for organ and choir extends across the chapel. The front of the gallery is of pitch-pine. The floor of area is of polished pitch-pine, and the passages of oak parquetry, while the benches are of plain deal with trefoiled heads. The nave is 50 ft. by 28 ft., and the sanctuary 20 ft. wide, terminating apsidally. The apse is lighted by thirteen lancet windows divided by columns, with carved capitals, from which spring the ribs that support a domed roof, these converging to a centre, with a carved boss. The roof is coloured pale blue, with gold stars and an aureole in the midst. Eleven of the windows are filled with stained-glass representations of St. Thomas, of Canterbury, St. Mary Magdalene, St. Helena, St. Aloysius, Our Lady, the Sacred Heart, St. Joseph, St. Francis, St. Clare, St. Teresa, and St. Ethelreda. On the right, a doorway leading to the sacristies 17 ft. 4 in. by 12 ft., and 12 ft. by 12 ft. The sacarium has a polished mosaic floor, inlaid with figures around the margin. On each side, fronting the nave, are figures of St. Mary and St. Joseph let into niches, with crocketed canopies and carved brackets. To the left there is a small Lady-chapel, which is not yet furnished. The nave is lighted by five lancet windows on each side. Between the windows are shafts, which support the hammer-beam roof. The architect was Mr. W. Hull, of Northampton, the contractor Mr. Richard Dunkley, his foreman being Mr. W. Brown, and the general manager Mr. J. Brown. The carving was done by Mr. P. Horsman, of London, and Mr. Phillips, of Northampton. The cost will not be less than £4,000, exclusive of the buildings of the new wing of the convent, for which another £1,000 may be added.

SALFORD.—The memorial-stone of a school in Trafford-road, which is being erected by the Salford School Board, was laid on Saturday afternoon. The main building, fronting Robert Hall-street, is two stories high. The girls' department is on the ground-floor, which contains a room 50 ft. long by 32 ft. wide, and two classrooms. Adjoining the entrance is a cloakroom. The upper floor is for the boys. It has similar accommodation to that provided for the girls, and is entered from West Worley-street by an easy and well-lighted staircase. At

the rear of the main building is the infants' department, one story high, with a large classroom for junior infants. Spacious playgrounds are provided, a considerable portion of which will be covered in. The buildings are in the Gothic style. The fronts are being faced with selected common bricks, broad masses of stock bricks adorn the bands and gables, and the dressings are generally in terra-cotta. The schools will provide accommodation for 600 children. The contract for the work is £4,750, and is being carried out by Mr. J. L. Ward, Manchester, from the designs of Mr. H. Lord, architect, John Dalton-street.

SEATFORD-ON-AVON.—The new cemetery was consecrated on Thursday, the 15th inst., by the Bishop of Worcester. The cemetery is situated on the Evesham-road, close to the town, and has an area of six acres. It has been laid out and planted under the superintendence of Messrs. Wood and Kendrick, architects, West Bromwich, by Mr. L. Kirshaw, of Brighouse. The curator's lodge, chapel, mortuary, and boundary wall are being carried out from the designs of Mr. T. T. Allen, architect and surveyor, Stratford, by Messrs. H. and C. Burden, of Chipping Norton, the contractors. Their contract for the work was £1,380. The style adopted is the Early Pointed Gothic. The external walls are built with blue lias stone (cased internally with brick-work, built hollow) and have Box-ground stone quoins and dressings throughout, including copings to the gables. The chapel and mortuary are being built about 100 yards from the entrance, and opposite the central walk. The chapel on the westward side is 32 ft. by 20 ft., with chancel 15 ft. by 6 ft. Adjoining the chapel, and between that building and the mortuary (which is 14 ft. by 14 ft., with apsidal end), will be the entrance porch and tower, the porch being 8 ft. square internally. The apex of the roof of the tower will be 50 ft. from the floor of the chapel. Seats will be provided in the chapel for about 60 persons. The floor under that part is to be boarded; and the whole of the other part of the floor of the chapel, including chancel, mortuary, and porch, will be laid with tiles and quarries of various patterns in concrete. The roofs of chapel and mortuary will be boarded under rafters with white deal; all the other roof-timbers will be red deal, stained dark, and the whole (including boarding) varnished. The entrance-gates for the carriage road and the railing on boundary wall have been supplied by Messrs. Macfarlane and Co., of Glasgow.

WITTINGTON.—New public offices for the Local Board of Wittington, near Manchester, have just been completed. The style is Queen Anne, worked out in a somewhat original manner, the body of the building being faced with buff bricks, and the dressings being of red terra cotta and stock bricks. On the ground-floor offices are provided for the clerk, surveyor, collector, and inspector, with a large drawing-office in connection with the surveyor's department. Committee-rooms, caretaker's residence, &c., are also provided. On the first floor there is a large room 50 ft. long by 25 ft. wide, suitable for public meetings, concerts, &c. The building has been erected by Messrs. R. Neill and Sons.

CHIPS.

At the meeting of the Staffordshire Agricultural Society held at Stafford last week, Mr. W. A. Keates, land agent, &c., of Newcastle, Staffordshire, was awarded a silver medal for designs for dairy-farm homesteads.

The memorial-stone of the new U.P. church in Loughborough-road, Sinclair-town, Glasgow, was laid on Monday. The new church, which is now almost completed, is in the Gothic style, and is seated to accommodate 800 persons. It is provided with front and side galleries, and the seats in the area of the church are all arranged in circles so that the sitters face the minister. The building is situated on a commanding site, and has a spire rising to a height of 115 ft. The architect is Mr. Baldie, Bath-street, Glasgow. The cost of the building is £5,000, exclusive of site.

It has been decided at once to proceed with the Maidstone and Ashford Railway, in connection with the London, Chatham, and Dover Company. Mr. Hopkins is the engineer, and will personally superintend the construction of the works.

During the past week the land has been surveyed for an extension of the Isle of Wight railway system from Newport to Yarmouth and Freshwater.

ARCHÆOLOGICAL.

ARCHAIC POTTERY AT HAMPTON WICK.—An interesting find of archaic pottery has been brought to light in excavating the foundations for a new wing about to be added to Chesfield, Lower Teddington-road, Hampton Wick, the residence of Mr. H. L. Tatham. At a depth of from 18 in. to 2 ft. the workmen came upon a number of earthen vessels, which their pickaxes unfortunately reduced to potsherds. Only one was secured in an almost perfect condition. This was the smallest of all, being but 6 in. in diameter at the bulging central portion, whence it tapered upwards and downwards. It may stand 8 in. or 9 in. high, and is furnished with a pair of well-proportioned handles. Two other vessels, cylindrical in shape, are without handles, and are about a foot in width and altitude. To the same type as these two belongs another, which was broken to pieces, all the fragments, however, having been gathered and preserved. The whole of the vases present the appearance of cinerary urns, and this identification is confirmed by their contents, which in every instance turn out to be charred bones. No portion of these ceramic remains bears a trace of the potter's wheel, and the whole have been sun-dried, not fired in a kiln. Among the detached potsherds are found portions of a chain-shaped ornament, which seems to have traversed the bulging body of an urn. Similar pottery is said to have been found at Hampton Court or its neighbourhood. No metal, glass, or amber, nor a single flint implement, has been discovered in association with the Hampton Wick urns, whence Mr. Tatham infers that these urns must be referred to a very remote period.

NORTH HANTS ARCHÆOLOGICAL SOCIETY.—The members of this society recently visited Salisbury and Stonehenge, under the guidance of Dr. Millard, their president, and Mr. Cooksey, hon. sec. On arriving at Salisbury the party spent some time in inspecting the Blackmore Museum collection, after which they went to the cathedral. The company shortly afterwards proceeded in brakes to Stonehenge, passing on their way the ruins of Old Sarum. Some explanation of the different theories as to the exact origin of the stones was afforded by members of the party, after which they returned to Salisbury through the fine scenery of the Avon valley.

COMPETITIONS.

COACHMAKERS' AND COACH HARNESS-MAKERS' COMPANY.—This company, as on previous occasions, has offered a number of prizes for competition among persons engaged in the trade of coachmaking—clerks, foremen, workmen, or apprentices who have been actually employed and resident in the United Kingdom and British subjects being eligible. Prizes consisting of silver and bronze medals, and sums varying from £2 to £10, are offered for free-hand drawings of foliage or ornaments from nature or in relief in pencil, ink, or crayon in outline, and not shaded; for working drawings of a canoe-shaped luncheon, and for full-sized working drawings on canvas-backed paper of a Victoria on elliptic springs. Each of the prizes will be accompanied with the certificate of the company.

DUBLIN SCIENCE AND ART MUSEUM.—Competitors for the above will have noticed that the Irish Commissioners of Public Works prescribe in the conditions clause 15, that the construction of the museum is to be fireproof throughout, and will do well to avail themselves of Messrs. Bennett and Ingle's offer made elsewhere, to supply particulars and estimates of their excellent and well-tried system.

LONDON. The competition amongst architects for laying out ground under the Leith Improvement Act Scheme, and for designing working men's dwellings, has been decided as follows:—First premium of £100 awarded to Mr. G. Wilson, of 19, Walk-terrace, Edinburgh; second premium of £50 to Mr. W. L. Bennett, of 15, North-street, Edinburgh; third premium of £25 to Mr. J. Hutton, of Commercial-street, Dundee.

The grand stand at Harefield has been partially rebuilt and decorated with colour for the proprietors; the contractor was Mr. Barber, of Bridge-street, Harefield.

SCHOOLS OF ART.

NEWCASTLE-ON-TYNE.—The annual distribution of prizes in connection with the Bath-lane School of Art was made on Tuesday evening by Earl Percy, M.P. The report showed that the school had been increasingly successful each year since its foundation. In the first year after the inauguration of the school in 1878, in the science department alone 53 prizes were given and 129 certificates; in 1879, 86 prizes and 163 certificates; in 1880, 135 prizes and 127 certificates; and in 1881, 186 prizes and 227 certificates.

CHIPS.

Last week we noticed, on p. 375, a tract addressed "To Builders' Men," by the Rev. J. W. Horsley, Miss A. Jefferies, of Church-street, Stoke Newington, informs us that it is but one of a series of quarterly letters to bricklayers, carpenters, painters, &c., written by the Rev. Gordon Calthrop, the Rev. Canon Ellison, Mrs. Wightman, and others, freely distributed to these men during working hours.

A new water-closet and bidet bowl has been patented by Mr. John Flanagan, of Newburg, N.Y. The invention consists in making a water-closet and bidet bowl with recesses in its rim to allow the hand to be introduced for bidet purposes; also in constructing the trunk or pot with embossments upon the opposite sides of the lower and upper parts to receive inlet and outlet air-pipes for ventilating the trunk.

At a special meeting of the Oxford Local Board on Monday, it was, after a long and animated discussion, unanimously resolved to appoint a committee to confer with the delegates of the University on the lodging-house plans submitted to the board, by Mr. Griffiths, C.E.

A memorial fountain to Sir William Collins, ex-provost of Glasgow, has been erected on Glasgow green, and is having a few final touches put to it preparatory to a formal opening next week. Mr. Mossman is the sculptor.

The Commissioners of Prisons have reported against the retention of Newgate, and it now only remains with the home secretary to indorse their decision. There has been a prison of Newgate for about six centuries and a half; the present building was erected between 1770 and 1782, from the designs of George Dance, R.A. Attached to it, a correspondent remarks, are the most inconvenient offices and halls for the transaction of the principal criminal business of the country that could be erected by the ingenuity of man.

A new Free Church in Westbourne-terrace, Hillhead, Glasgow, was opened for public worship on Sunday. Designed by Mr. J. Honeyman, architect, the building is in the Italian style, and will accommodate 750 sitters. The church is provided with several session halls.

The sluicing arrangements made by Mr. Lyster, engineer of the Mersey Docks and Harbour Board, rid the landing-stage of the inconvenience caused to by the tail of the Pluckington Bank appear likely to prove successful. For the purpose of experiment one of the number of pipes laid for the sluicing was one day last week opened for eight minutes, with the result that a channel 20 ft. in length (right to the edge of the water), 20 ft. broad, and 10 ft. deep was made. Preliminary operations against the Bank were commenced in earnest on Wednesday. At low tide in the morning seven of the sluices at the south end of the stage were opened, and the same number again at low tide in the afternoon. The water is led from the George's dock by a large culvert, and its admission to the row of sluices is regulated by a "clough," which is worked by a winch above. This clough was opened to the extent of only a few inches, though it can be raised to the height of 9 ft. The rush of water from the seven sluices was very strong, the water all round was churned up into a muddy foam, and it could be seen that the substance of the bank was being driven under the stage and out into the main current of the river. The flow of water was maintained for about an hour, and was suspended shortly after the tide began to flow in. The Dock Board will make their full efforts to get rid of the bank at the spring tide in next month, and it is hoped that they will be successful in sweeping away the troublesome sand-bank from the neighbourhood of the landing-stage, where it has not only interfered with traffic, but also threatened serious injury to the stage itself.

The parish-church of Hayland, near Sheffield, is undergoing internal restoration, including the replacement of the present high-backed pews with open seats, and the substitution of hot-water for hot-air apparatus. Mr. W. H. Sykes, of Hayland, is the architect, and the contract has been let to Messrs. T. and J. Hawley, of Penistone.

"To a practical man with a taste for mechanics, and the bumps of constructiveness fairly well developed, we can conceive no higher mental treat than a couple of hours spent over the June numbers of that truly marvellous publication the *Anglo-Mechanic*. In a hundred and fifty odd pages that make up the bulky mass of letterpress, there is recondite information on almost every conceivable subject, ranging from how to construct a mouse-trap, to the latest method of calculating the phases of Orion."—*The Brightonian*. Price Two-pence of all newsmen, or post free 2½d.—31, Tavistock street, Covent garden, W.C.

TO CORRESPONDENTS.

[We do not hold ourselves responsible for the opinions of our correspondents. The Editor respectfully requests that all communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondence.]

All letters should be addressed to the EDITOR, 31 TAVISTOCK-STREET, COVENT-GARDEN, W.C.

Cheques and Post-office Orders to be made payable to J. PASSMORE EDWARDS.

ADVERTISEMENT CHARGES.

The charge for advertisements is 6d. per line of eight words (the first line counting as two). No advertisement inserted for less than half-a-crown. Special terms for series of more than six insertions can be ascertained on application to the Publisher.

Front Page Advertisements 2s. per line, and Paragraph Advertisements 1s. per line. No front page or paragraph advertisement inserted for less than 6s.

SITUATIONS.

The charge for advertisements for "Situations Wanted" is ONE SHILLING for TWENTY WORDS, and Sixpence for every eight words after. All Situation advertisements must be prepaid.

Advertisements for the current week must reach the office not later than 5 p.m. on Thursday. Front page advertisements and alterations in serial advertisements must reach the office by Tuesday to secure insertion.

TERMS OF SUBSCRIPTIONS.

(Payable in Advance.)

Including two half-yearly double numbers, One Pound per annum (post free) to any part of the United Kingdom; for the United States, £1 6s. 6d. (or 6dols. 40c. gold). To France or Belgium, £1 6s. 6d. (or 35f. 30c.). To India (via Brindisi), £1 10s. 10d. To any of the Australian Colonies or New Zealand, to the Cape, the West Indies, Canada, Nova Scotia, or Natal, £1 6s. 6d.

Cases for binding the half-yearly volumes, 2s. each.

NOTICE.

Now Ready.

Vol. XL., Price 12s. A few bound volumes of Vol. XXXIX. may still be had, price Twelve Shillings; all the other volumes are out of print. Most of the back numbers of former volumes are, however, to be had. Subscribers requiring any back numbers to complete vol. just ended should order at once, as many of them soon run out of print.

RECEIVED.—H. H.—R. C. R. of I.—J. G. S.—J. S.—J. P. P.—W. M.—H. B.—J. A. M. of A.—B. R. B. E.

BOYCOTTED. (Probably the secretary is away. If in a week or two you receive no reply, repeat your query.) —A COWLEY-SHAW. (B. T. Batford, 52, High Holborn, W.C.) —SUBSCRIBER. (Anybody may use the initials.) —H. C. "Contract Criticities" (The statement made at the end of the above article was founded on the decision of the case of Lidlav v. the Hastings Pier Company.)

Correspondence.

ROCKING MOTION IN SIPHON-TRAPS.

To the Editor of the BUILDING NEWS.

SIR,—On page 376 Mr. Davies, in describing the working of the S-trap, says: "The wind, on blowing up the soil-pipe, or down the ventilating-pipe, plays on the water, causing it to rock rapidly, owing to the shape of the trap. This rocking motion of the water causes it to ebb out through the out-go of the trap; thus, the so-called S-trap ceases to be a trap, and becomes only a snare."

Now, it would be interesting if Mr. Davies would give us the particulars of any arrangement which has come under his personal inspection, in which a siphon-trap became unsealed in this way. I once had, myself, doubts as to the safety of siphon-traps when exposed to the effects of strong winds, and, to satisfy myself, I tried the following: In an exposed position at Margate, I had the following arrangement—viz., S-siphon, 1½ in. s.d., into a tin soil-pipe, carried up full bore, with large open trumpet mouth on top, the trap having a 2 in. vent into the head-vent.

During several very heavy gales I watched the seal of this trap, and found that the effect of the wind was to send out about ½ in. or just sufficient to make room for it to sway. I once locked the door for 6½ hours, and then found seal perfectly safe, only ½ in. having gone. I

have also made observations in two other cases with the σ -trap, with a similar result. Has Mr. Davies ever tried this effect on the seal of a σ -trap?—I am, &c.,

DANIEL EMPTAGE, S.E.
Dane Hill Sanitary Works, Margate.
Sept. 19.

DAVIES' σ -TRAP.

SIR,—A correspondent signing himself "D. Emptage," complains that, having made a trap according to my plan, finds it will not act. In his letter he gives some of the measurements of his workmanship, and, unfortunately for him, these measurements prove that his trap is not according to my model. If he will study my plan and work to it, he will find the result satisfactory. It is simply preposterous to deny the effectiveness of my model, when it has been shown working successfully to about 500 of the principal members of the trade, at the late discussion at the Society of Arts rooms.

Mr. E. must not forget that it requires a practical plumber to make models properly. I am quite prepared to admit that there are very many men in the trade who are not practical; and whether or not the plumber (?) who has been trying to work to my plan is competent it is impossible for me to say.

By the bye, speaking of practical plumbers, I notice you have a correspondent signing himself by that nom-de-plume. He ridicules the idea of our models, as being toy-work. Does he know that one of the finest buildings, by one of the finest architects England is able to boast of, was first made in model for approbation? I fear not. I allude to St. Paul's Cathedral, by Sir Christopher Wren. Then again, the models of Watt, the great engineer, as also Wren's, are still on exhibition.

I cannot understand how I am insulting common sense by showing incompetent people the proper way to do their work, and seeing that the models in question were made at the request of and especially for the satisfaction of the Board of Health, "P. P." is placing a very low estimate on the intellectual capacities of that very important body.—I am, &c.,

P. J. DAVIES.

EXAMPLES OF DOMESTIC ARCHITECTURE.

SIR,—I should like to explain, for the information of your readers, what are the rules which I believe to be unknown to the profession.

They consist in tables of simple numbers by which, when one side of any of the harmonic triangles is known, the others are readily found. It has long been known that $7:22$ and $113:355$ give closely approximating proportions between the diameter and circumference of the circle. There are other equally simple relative numbers which give as close approximations to every other geometric proportion derived from the regular polygons.

Whether the originator of the $7:22$ formula for calculating the circumference from the diameter of a circle was braided as a charlatan I cannot say; all I know is that posterity make general use of his rule.

I am prepared to prove that the tables of numbers which I use give more correct results than can be obtained by the older and more lengthy methods of calculation.

That the ordinary empirical formula can be made to yield more satisfactory results is no argument against the theory, as it would be found upon examination that all good designs really contain the harmonic proportions, whether their authors are conscious of it or not.

I have not attained perfection in the application of the theory, and do not regard my productions as works of high art; all I contend for is that a design, in which the polygonal proportions are present, gives a better result for the same expenditure than a similar design in which they are not found.—I am, &c.,

THOMAS HARTAS.

King's Chambers, King-street,
Manchester, Sept. 20.

P.S.—I notice a misprint in your article. "D. R. Kay" should be "D. R. Hay." It is Mr. Hay who traced the connection between the musical notes and the polygonal angles, on which point I simply accept his conclusions.

A museum in the new free library buildings at Wolverhampton was opened to the public last week.

Intercommunication.

QUESTIONS.

[6666.]—**Painting.**—Will any one be so good as to state how water-colour painting on satin or silk is done, and what medium or special preparation of colour is used, and oblige?—AMATEUR.

[6667.]—**Religious Houses of the Middle Ages.**—What are the best books on the religious houses of the middle ages, their history, manners and customs, dress, &c. I do not so much want an exhaustive treatise as a book of reference.—ESQUIRE.

[6668.]—**Involution.**—How do I raise any number to the 3/5 or the 1/6 power? Arithmetics only deal with the case when the index is a whole number.—MANCHESTER.

[6669.]—**Lighting Cellar.**—Can any of your subscribers say which is the best method for lighting that portion of a cellar which comes immediately below a shop-door? Isn't a combination of wood and glass better than one of iron and glass?—J. H. A.

[6670.]—**Enamelled Iron Tiles.**—Does the enamelled iron now being used instead of tiles keep its shape, or is it, after a time, liable to warp or bulge?—LIVERPOOL.

[6671.]—**Rights of Light.**—(1) For how long after an adjoining owner, A., has put glazed openings and glazed lights overlooking his neighbour's, B., can the latter block them up, i.e., block up the view? Is it within 20 years? (2) Where the objectionable lights are inserted, exactly in the boundary line, if B were to brick up on his side excluding light and air, after having allowed the objection for 12 months, would his action be legal? (3) Where positive deterioration occurs in the value of B's property by A's building and lights, can compensation be legally enforced? (4) Should any one kindly answer these queries, may I ask in addition for (if convenient) the reference to the Act of Parliament confirming the replies?—F. T.

[6672.]—**Interior Perspective.**—It is so many years since I practised the art of drawing perspective that I have forgotten one important matter relative to the subject, and shall be greatly obliged if any one of your practical readers will inform me, 1st, In drawing a full-length interior perspective of a church, what is the best position for the station point in relation to the position of the western wall? 2nd, Is there any other reason against placing the station point in a line with the western wall than that the result will be very "sharp" perspective? Even if so, would it not be truthful?—A. B.

[6673.]—**Water Colour Painting.**—Will any one kindly recommend me a book on water-colour painting, suitable to one who has not the advantage of a master?—ARTIST.

[6674.]—**Roof Strains.**—Will any of your readers kindly give the formula for taking out the strains of the struts for an iron roof? Hurst's formula is too protracted for practical purposes.—ENGINEER.

[6675.]—**Mounting Lecture Illustrations.**—I propose to illustrate a paper on an architectural subject by diagrams, plans, engravings and photographs. Of the latter, some are mounted on cardboard and some unmounted. I shall feel obliged if any correspondent will say which is the better ground for displaying these, brown, white, or cartridge-paper, and whether paste, starch, or gum is preferable for fastening the photos to this backing, as I want to remove them from it unimpaired after the lecture?—EAST ANGLIAN.

[6676.]—**School-Rooms.**—I notice a query in last week's BUILDING NEWS about school space. Will any correspondent kindly state what should be the width of a school-room? This, I conclude, not a variable size. Which is the best way to seat boys in 4 rows deep? If so, what should be the width of each row, and then what should be the width of space in which the teacher can demonstrate his lecture between last row of boys and the wall? What number of lineal feet should be allowed for 250 boys? Should the desks be in tiers on raised dais, or all on same level? What height between floor of lowest wall, and sill of window is best for teacher's eyes?—S. J. C.

[6677.]—**Cemetery Lodge.**—I shall be greatly obliged if some kind correspondent will advise me on the following:—In a design for a caretaker's lodge to a cemetery of three and a half acres, for a population of five thousand, a lych-gate is introduced under the same roof as the lodge, and is sit. N. high. Exception is taken to the height, saying it should admit a hearse or carriage. By increasing the height to that extent the bedroom over would be sacrificed, and extensive roads would have to be made where walks would be sufficient, and would have to be wider and permanently made. It is not intended to have a mortuary chapel, but to read that portion of the service under the lych-gate, which, it raised to, say, 11 ft, would lose in shelter. At one of the most important cemeteries in Ireland no hearse or carriage is allowed to enter, but for those who do not wish to carry the coffin, it is laid on a small carriage, like a gun-carriage, and may be drawn either by men or by a horse.—D. M. J.

[6678.]— **σ -Traps.**—I have taken great interest in this controversy. Its outcome will undoubtedly tend to the beneficial advancement of hygiene and improvements in sanitary appliances with more care being paid to their manufacture. There is one form of trap I have not seen mentioned in your columns; I refer to the σ -trap. I feel sure it would be interesting to your readers to have the valued and practical opinion of Mr. Davies and your other correspondents upon this form of trap, as it is well known that much reliance cannot be placed upon theoretical descriptions in circulars and testimonials, which are very often interested. Of course, these are only general remarks, and have no direct reference to the appliance in question. The principal feature is the trough or channel being carried to end of trap, and the contents are emptied over both of its sides. If any of your readers can tell me where one is fixed I should much like to see it.—INQUIRER.

REPLIES.

[6624.]—**Disinfecting Stoves.**—Send to Leoni and Co. for their catalogue of gas apparatus, including large gas disinfecting stoves, as satisfactorily worked for bedding and clothing at the London Hospital, the disinfecting house of the Litchhouse District Board of Works, and other places.—H.

[6649.]—**Roof.**—The sketch of roof shown by "Dennis" is not a very good one, as the effect of the load and wind-pressure would be to strain the cross-braces or ties of the main principals. I have an objection, based on some experience with roofs of this kind, to the small horizontal tie shown between the chief braces; it tends to produce an injurious cross strain upon the braces. The lower struts down the wall help to neutralise this strain; but they have also the disadvantage of indirectly weakening the braces. A better mode of tying is to carry on the horizontal tie to the principals if it is of iron, and to avoid the lower struts unless they can be made to continue to the principals. The mechanical stresses to which such a roof is subjected may be approximately conceived by supposing the cross-braces together with the main rafters formed two overlapping triangles. With regard to the thrust, no theoretical calculation could be safely relied on, as in a roof of this sort the perfection of the joints is everything. The slightest play in the iron straps connecting the principals with the cross braces would make all the difference between a thrust which would be nil and one exercising the force of untied rafters at this angle. Supposing the joints are perfect, the thrust might be too trilling to be regarded as injurious to good walls well buttressed, though a 40 ft. span roof, of the angle shown in the sketch, without a direct tie, would be constantly exercising a thrust that would in time impair the verticality of the walls. It would be impossible to say how much a laminated rib of this span made in the manner described would expand, but if the thicknesses of deal are well put together, the expansion would be trilling compared with the former. I would sooner construct a semicircular laminated roof for security, but 6 in. deep is too little; it ought to be at least 9 in. If the springings of the ribs are brought down nearly to the ground, this mode of construction would be far safer than a braced roof of the kind shown.—G. H. G.

[6650.]—**Ventilation of Soil-pipe.**—There are two points to be considered. First the w.c. apparatus. The pan closet is a bad system, and if the one mentioned is at all old, it is probably half-filled with putrid matter, and this being on the inner side of the trap, whilst the ventilating pipe is on the outer, the foul gases would of necessity escape into the room itself. Therefore take out the pan closet and remove by a flush or wash-out closet with siphon trap and which can be obtained from Doulton, Buchanan, and other makers; the most important improvement being found in several of the best. Second, the ventilating pipe; has this an intercepting trap open to the air at the ground level? I suspect not, and if so how can any ventilation be expected to take place when there is no inlet to the pipe? It is always necessary that there be two openings to the air, one as an inlet and the other as an outlet; one opening is sufficient only when its size is very large, as for instance an open window, where air will enter at one part of the opening and make its exit at another, but a ventilating pipe could not have sufficient diameter for this purpose, it would have to be feet instead of inches, proportionately to its length. Disconnecting or intercepting traps of stoneware with gratings for purposes of cleaning can now be had of all the best stoneware manufacturers or sanitary engineers. Where so many are good, I care not to give names.—HUGH McLAUGHLIN.

[6650.]—**Ventilation of Soil-pipe.**—The ventilating pipe should be the full size of soil pipe. I have used all the cowl in the market, and for the above purpose consider them useless. There should be an inlet for fresh air at the foot of soil pipe, or, say, at the nearest point to main drain. Trap on house side.—In several cases I have taken away the bell traps in a eas and simply placed an iron grating to answer as inlet, and in no case have I had the least complaint.—WILLIAM H. BUTCHER.

[6650.]—**Ventilation of Soil-pipe.**—The fault is not in the open end of the pipe. No cowl, however "excellent," will "cure" a 2 in. ventilating pipe. It is too small in diameter. It should be not less than 4 in. or 4 in. It should be, indeed, the same size as the soil pipe. The apparatus, being a pan-closet, is not of good form; but the best way of proceeding, with as little alteration as possible, is to take down the 2 in. ventilating pipe and put up a 4 in. or larger pipe in its stead, for this is necessary in any case. There should be an opening into the drain near its outlet at the sewer or cesspool, to admit fresh air to the drain and soil pipe.—C. S.

[6650.]—**Ventilation of Soil-pipe.**—The ventilating pipe is not large enough in the case mentioned by "T. P. F." It should have been at least 3 in., or the same diameter as the soil pipe, and have had a suctional cowl, as that made by Messrs. Boyle or Banner, at the top of it. At present, no doubt, the pipe acts as a down cast, and the sewer gases are forced in through the traps, thus making matters worse than they were before. If there had been no pipe as a ventilator, but instead, there had been left an outside opening level with the trap for ventilation, the gas would have been constantly escaping without the inconvenience. The objection to tall ventilating pipes, I find, is that they impede the escape of the gas through them, and often operate in a reverse way to that intended. One of Ewart and Co.'s cowls would no doubt answer the purpose of "T. P. F."—G. H. G.

[6651.]—**Wood Block Flooring.**—I have never heard of or found any objection to the use of wood blocks if properly laid. They should be laid on a bed of concrete properly floated or asphalted. For schools this flooring is less noisy and more durable than floorboards.—G. H. G.

[6651.]—**Wood Block Flooring.**—I have often seen the wood-block paving laid in Board schools, Mission churches, coach-houses, &c., in the following manner:—The blocks are cut from deals 9 in. by 3 in. by 2 in., laid herring-bone-wise, or in other patterns, rough planed on top, the undersides being in tar before laying on 6 in. of concrete, carefully levelled to an even surface.

The floor is scattered over with sand, and well brushed between joints. However, in coach-houses and positions of the washed down, grouting with cement is preferable. Any block wearing out of level can be easily replaced. They are better with out any joining together on this account. The cost is, I believe, a trifle over ordinary wood flooring.—J. H.

[6651]—**Wood Block Flooring.**—This makes a capital floor for schools, but requires to be laid in quite a different way to that mentioned by "Providence." If he will communicate with me, I will put him in the way to get what he wants.—R. WALKER, Kent.

[6654]—**Dimensions of School.**—If your correspondent "Alpha" will refer to Messrs. Hudsons and Kearn's "St. Southwark Street, S. L." "Reference book," price five shillings, on page 134 he will find the rules laid down by authority of the Committee of Council on Education for the Building and fitting up of S. schools, to be all that he requires.—THOS. G. CARLWORTH.

[6654]—**Dimensions of School.**—The length of a schoolroom is best determined by the groups of benches and desks. An allowance of 18in. is given for junior pupils by the Council on Education and 22in. for senior pupils. Thus a group 6ft. long would accommodate 4 children in a row, and for a senior pupil 7ft. 6in. long will be required for the same number. If there are 4 groups, a room 26ft. by 18 to 20ft. suffice for 48 children. Three rows of benches and desks are considered sufficient for a group. According to the School Board regulations, the principal schoolroom should provide 80 cubic feet of space per child.—G. H. G.

[6654]—**Dimensions of School.**—"Alpha" does not mention the class of school he requires to design, whether for boys and girls or infants. The accommodation for children above seven years old is calculated by the space at the desks, viz. 18in. for junior classes and 22in. for senior classes "per child." For infants below the above an allowance of 8 square feet per child is made, and the width of school in both cases would be from 16 to 20ft., according to length. The above rules are in conformity with the requirements of the Educational Department.—I. J. THOMAS.

[6656]—**Round Timber.**—The only books I am acquainted with are Hutton's and Hopps's, the former 3s. and the latter 1s. 6d. I believe they may be obtained from Batford.—JAMES F. BELL, Bolton.

[6657]—**Architects' Prospects in Australia.**—"N. Y. Z." will find similar questions to those he asks on p. 456 of the BUILDING NEWS of this year (April 15). No. of question 456, and the replies on p. 435 (April 15th).—F. T.

[6658]—**Ventilation.**—The simplest plan of ventilating the billiard room would be to place a ventilating shaft in the centre of roof and fix on it an exhaust cowl ventilator. For the admission of fresh air, upright tubes, about two or three on each side of room, with a valve to regulate the air, ought to be introduced leading to the outside. Boyle's ventilating tubes and air-pump ventilators might be used. If the lofty building at the side interferes with the action of the cowl or exhaust ventilator, the tube may be carried up the wall and have an exhaust or Verity's air propeller at the top. Ventilating gas pendants, such as Faraday and Son's, ought to be used, or Verity's ventilating sunlights.—G. H. G.

[6659]—**Plasterers' Work.**—Measure the length of cornice from centre of projection on each side of room. Cut same from ceiling line to wall line or from the running mould. Charge extra for each angle exceeding 45in. each room.—JAMES F. BELL, Bolton.

[6661]—**Science and Art Exam. in Architecture.**—Apply to the Secretary, Science and Art Department, South Kensington, who will forward examination papers on receipt of 2d. in stamps. There is no really good book treating on all the branches of architecture except Gwilt's. I would advise "J. P. T." to procure books on separate subjects. For Gothic, consult the works of Pugin, the Brothers Brand and Britton, T. Talbot, Barry's Woodwork. Beware of investing in 15th century books on Gothic. Classic books of this date are, however, useful, if not the best, such as Stuart's and Revett's works, Nicholson's "Orders," and Henry Shaw's "Elizabethan Architecture."—JAMES F. BELL, Bolton.

[6661]—**Science and Art Exam. in Architecture.**—The examination of the Science and Art Department in building construction are usually held on the first Saturday evening in May in various parts of London and the country. There are three stages, viz. Elementary, Advanced, and Honours. Copies of past examination papers may be purchased at the stalls in South Kensington Museum, or may be had by post from the Secretary of the Department. Livingston's "Notes on Building" will be found good textbooks. I should strongly advise "J. P. T." to try one of the various classes that are now taking in various parts. I attended one at the Grosvenor Hall, London, last year, and received excellent instruction from a thoroughly practical man, and was enabled to pass the advanced stage.—H. SMITH.

[6661]—**Science and Art Exam. in Architecture.**—The following is copied from syllabus of the "1st and Advanced Art Examination" in the above subject. "Candidates for examination in architecture are expected to show a knowledge of the Five Orders of Greek architecture with their mouldings; a general knowledge of the principles of construction applied to ancient architecture, and of other leading features of classical architecture, such as colonnades, pedestals, doors, windows, &c., and of the decorative features usually applied to the various buildings, together with the principal differences between the Greek and Roman orders, and a knowledge also of the large distinctive characteristics of Gothic architecture in England from the time of Edward the Confessor to that of Henry VIII." I do not know of any copies of such examination papers published or not. For books, see p. 102, B. N. "Intercommunication."—W. B.

[6665]—**Rain Penetrating into Buildings.**—The shrinkage of the timbers would naturally cause rain to percolate at the joints. There ought to have been fillets to receive the panes or the laths. Painting with putty and white-lead may answer if properly done. If space allowed between the frame and timbers, and the surface of panes, small fillets might be fixed to cover the joints in putty.—G. H. G.

LEGAL INTELLIGENCE.

SHOP BASEMENTS.—At Wandsworth police-court on Wednesday an important case was heard, having reference to the construction of shop basements, Alfred Boon, a builder, being summoned at the instance of the Wandsworth Board of Works for proceeding to the erection of houses in the Battersea Park-road contrary to the order of the Board. It appeared that the defendant sent in an application for the erection of a number of shops with basements. Upon that the Board passed a resolution in effect stating that they could not permit the houses to be erected below the level of the road. Mr. Guy, who appeared for the defendant, said he believed the point had never been raised before. If allowed, it would practically prevent the construction of basements in London. Mr. Corbellis, clerk of the Board, said the main sewer was laid in the Battersea-park-road fifteen years ago, and on the occasion of storms the water arose and flooded the basements. The only way to avoid the difficulty was to prevent the construction of basements. Mr. Pidditch, the surveyor, was called to corroborate that statement. After a lengthened argument, in which the magistrate thought the Board had power to make the order, Mr. Corbellis suggested that the defendants should fill up the basements which he had already constructed. The defendant asked to be allowed to retain the basements to some half-dozen shops on the understanding that the remainder should be erected without them. The summons was ultimately adjourned to allow of an arrangement.

THE EMPLOYERS' LIABILITY ACT.—Farmer v. Jarvis.—City of London Court, Sept. 21.—Before Mr. Besley.—This was an action by William Farmer, a carpenter and shopfitter, residing in Fortham-street, Whitechapel, against his late employer, a builder, of Half-moon-street, Bishopsgate, to recover compensation in damages for injuries sustained through the alleged negligence of a fellow-servant.—Mr. Grain was counsel for the plaintiff. Mr. Forest Polton for the defendant.—Mr. Grain said this was the first action that had been brought under the provisions of the Employers' Liability Act, whereby an employer is now liable for injuries sustained by a servant through the negligence of a fellow-servant.—On the 29th of June the plaintiff was ordered to assist in the lowering of a sugar shelf from the top to the bottom of the defendant's premises. The shelf, which weighed about 3cwt. was being lowered by means of a rope and pulley, which was intrusted to a fellow-workman named Parrott, under the direction of the foreman. In the course of its descent it stuck on a projection, and the plaintiff was ordered by the foreman to go down and ease it off. He had no sooner touched the shelf than some one above jerked the rope, causing the shelf to fall rapidly to the ground, and in its passage downwards it caught the plaintiff's right hand and lacerated it. He attended at the London hospital for several weeks, and had earned but 6s. since, the wound being still open, preventing him from working.—The defence was that the accident was the result of contributory negligence on the part of the plaintiff, in suddenly pushing the shelf off its resting-place.—Parrott was called, and in answer to questions, admitted that there was a post on the stage where he was standing, for the purpose of winding the rope round to afford a better hold; but the rope in use at the time was too short to enable him to avail himself of it, and when the shelf was pushed off he (witness) was "drawn up." The jury returned a verdict for the plaintiff, damages £10.

WATER SUPPLY AND SANITARY MATTERS.

THE CANTERBURY SEWAGE WORKS.—After two years' labour, and heavy outlay, the New Sewage Works have been perfected and are now in full working order. The total cost has been £8,300. The sewage farm covers 22½ acres of land, lying to the east of Sturry-road. Eleven acres are devoted to the cultivation of mangold wurtzel. Three acres have been sown in oats and tares, the remainder in pasture land, from a portion of which a crop of very fine hay was recently sold for £18. In future, the whole of the land will be cropped as heavily as it possibly can be with a variety of what are considered to be the most profitable products. The Broad Oak Sewage Works will be utilised as heretofore in conjunction with the new works. The whole of the sewage matter from the city will be conveyed to the old works in the first instance; the solid matter will be separated from the liquid which after filtration will run to the new works for irrigation purposes as described below. The solid matter is retained at the Broad Oak Works, the effluent water alone being spread over the land. At the pumping-station, as the sewage water enters the well from the old works, it is pumped up and delivered through five lengths of 18in., 15in., and 12in. covered stoneware carrier-pipes, extending the length of the land. The sewage in its passage

along the carriers is stopped by sluices in the distributing-wells, which are placed at distances of about 200ft. apart. The water rises in these until it reaches the surface of the land, when it passes through sluices which are made to regulate the flow of water, so that either a small or large quantity can be put on any particular piece of land. There are 28 distributing-wells to the 25 sections of land, each 220ft. by 220ft. Each section is surrounded by a grip, which is sunk about a foot below the level of the land. Running by the side of this there is a path covering the carrier-pipes, which is raised about a foot above the land. This acts as a barrier to the water, and keeps each section divided. The distributing-wells are so arranged that they can all be opened at the same time, and allow of an equal flow of water over the whole land, or the whole force of the water may be discharged through one distributing well upon any section. The advantage of this in reaping and sowing crops is very apparent, as the distribution of the sewage water is under perfect control, and one section of land may be worked while another is recovering from a flooding. Mr. Hall is very confident as to the capabilities of the land to take all the water that is thrown upon it. It has a subsoil of gravel, through which the water easily percolates, and then it is assisted to the outlet by a very perfect system of under-drainage, in which there have been used 500ft. of 2ft. main to carry the raw sewage to the pump-well; 2,000ft. of 18in., 3,000ft. of 15in., 450ft. of 12in. carrier-pipes. Under-drains 1,520ft. of 12in. piping, 7,000ft. of 9in. pipes, and 1,670ft. of 6in. pipes. In laying the carriers and under-drains, the mould forming the upper surface has varied from 18in. to 2ft. 6in. in depth, the substratum being gravel to a depth of more than 10ft. The water becomes purified by percolating. After passing through the ground and into the drain it is carried to the outlet, where it is discharged in the main drain and carried to the outfall about 300 yards below Fordwich bridge. Here the effluent water presented a marked contrast to that in the outlet from the old sewage works. Its indescribable colour and poisonous odour had been entirely purified, and it came rushing forth from the drain in a colourless and tasteless state. With the exception of a small portion, the land is all about 4ft. 3in. above flood-line, and is perfectly clear of danger from flooding, but, as an extra precaution, Mr. Hall has raised a substantial embankment. The whole of the work has been executed from the designs and under the personal supervision of the City Surveyor, Mr. J. G. Hall, Assoc. M. Inst. C.E.

STATUES, MEMORIALS, &c.

BIRMINGHAM.—The ceremony of unveiling the George Dawson Memorial statue has been fixed for the 5th October. The statue, which has been executed by Mr. Woolner, R.A., has arrived, and will shortly be placed upon the pedestal. It represents Mr. Dawson in a characteristic attitude, standing as if addressing a public audience. The site is at the end of the wall on the north side of the Town Hall in Congreve-street. A canopy rising to a total height of 40ft. above the ground has been erected over the pedestal, and the structure is now receiving the finishing touches. The canopy is carried upon four granite columns, and has four gables, in each of which is placed, in medallion form, a head carved in high relief by Mr. Woolner. The heads are typical of religion, letters, statesmanship, and poetry, and represent Bunyan, Carlyle, Cromwell, and Shakespeare. The upper part of the canopy terminates in a pinnacle, the design of which is somewhat in keeping with that of the Chamberlain Memorial, and the gables are carried on foliated arches, and have pinnacles at the angles. The canopy is of Portland stone, and has been designed by Messrs. Martin and Chamberlain. This part of the work has been carried out by Messrs. Barnsley and Sons.

STAINED GLASS.

KIDDERMINSTER.—A stained-glass window has been placed in the north transept of St. John's Church in memory of the late Mr. Joseph Kitley. It is a three-light window, and represents scenes in the life of Daniel, the prophet. In the first Daniel is represented as interpreting the king's dream; in the second he is occupying the position of president of the council; in the third he is on his knees praying. The base and canopy of each is surrounded by a border of ruby and pearly-white. The top portion of the transept is lighted by a rose window, of a floral design. The window has been supplied by Mr. John Davies, Wyle-cop, Shrewsbury.

ST. MARK'S CHURCH, MILVERTON.—A memorial window has been placed in this church to the late vicar, the Rev. Chas. Carus-Wilson. The window is at the east end, and is about 25ft. high by 17ft. wide. It is divided into eleven scenes, in addition to the tracery work above; they all repre-

sent events in the life of our Saviour, "The Agony in the Garden," "The Betrayal," "Before Caiaphas," "Denial of St. Peter," "The Judgment of Pilate," and "Crowning with Thorns" are in the lower tier; above are "Bearing the Cross," "Ascent of Calvary," in the large central light "The Crucifixion"; "The Descent from the Cross," and "The Entombment." The tracery spaces are filled with angels bearing instruments of the Passion, and the scenes surmounted with canopies of "tabernacle" work. The colours are copied from old English glass of the 14th and 15th centuries, and the details in the costumes are founded on research. The work has been carried out by the firm of Cox, Son, and Buckley, of London.

CHIPS.

At a meeting of Galashiels Town Council, held on Monday, a letter was read from Mr. Scott, of Gala, offering the cricket-ground as a public park, if the Corporation would agree to keep it in order. It was agreed to accept the offer with thanks.

The parish-church of Bistre was reopened on Tuesday by the Bishop of St. Asaph, after restoration at a cost of some £700.

Amongst the liquidations by arrangement mentioned in Tuesday's *Gazette* is that of Tom Anderson, The Terrace, Boston Spa, and of Victoria-buildings, Park-lane, Leeds, architect and surveyor.

Newsick-wards are being added to the workhouse at Newport, Isle of Wight, from the plans of Mr. W. T. Stratton.

An exhibition of gas-heating, lighting, and cooking apparatus was opened at Aberdeen on Monday.

The new town-hall at Ayr, which has been erected at a cost of £30,000, was opened on Monday evening by the performance in the principal room of Handel's "The Messiah." The organ has been built by Messrs. C. T. Lewis and Co.

Mr. S. J. Cardidge, of the National Art Training School, South Kensington, was unanimously appointed, on Tuesday, by the committee, head master of the Hanley School of Art, in succession to Mr. A. A. Bradbury, who has been appointed head-master of the Derby school. There were twenty-six applicants for the office.

As some workmen were engaged on Tuesday in the repair of the front of an old timber house on the Wyle Cop, Shrewsbury, they knocked off a thick coating of plaster, and discovered, in a perfect state of preservation, a beautiful window, with Late Perpendicular tracery, of between 1500 and 1550. The window is in a room in which Henry the Seventh is said by tradition to have planned the battle of Bosworth Field.

American exchanges intimate the partial failure of the system of jetties devised by Captain Eade, for the South Pass of the Mississippi, and which has been described in our pages. It is asserted that the deep channels are not permanent, and are only kept partly open by continual dredging.

The town council of Ashton-under-Lyme agreed at their last meeting to accept the offer of Stamford-park, estimated to be worth £40,000, to be kept up at the joint cost of the local authorities of Ashton, Stalybridge, and Hurst, as a public park.

New Congregational Sunday-schools at Thornton-leath, Croydon, were opened last week. They are built of Lascelles' concrete slabs, on a wooden framing, rough-cast on exterior with cement and gravel. Inside the building is lined with match-board. The chief room is 40ft. by 30ft., and 12ft. 6in. high to plate of open-timbered roof. At the rear are four classrooms, two 14ft. by 13ft., and two 13ft. by 10ft. 6in.; over these is an infants' room, 28ft. by 18ft. The total cost has been £697, and it was stated at the meeting that estimates were invited from two builders for a plain brick building, and both were above £1,200.

The late Dean Stanley has bequeathed all his curiosities and historical relics to the University of St. Andrew's, and the executors, in handing them over, have expressed a wish that they should be preserved in a separate cabinet.

The eighth annual exhibition of modern pictures in oil at the Royal Pavilion Gallery, Brighton, is to be formally opened to the public to-day (Friday). The gallery contains about 550 pictures, 110 of which are by local artists.

The Hartlepool harbour commissioners resolved on Tuesday to apply to the Public Works Loan Commissioners for a further loan of £6,000 for harbour improvements. Reports were received from the consulting engineer, Mr. Hawkins, and from the commissioners' engineer, Mr. William Belk, as to the breakwater extension, which is of large concrete blocks, and has now been carried 15ft. below low-water point.

Our Office Table.

SIR EDMUND ANTROBUS, of Amesbury, has written a letter in regard to the restoration of Stonehenge, in which he says:—"For some years I have doubted the safety of the eastern trilithon, and, having obtained the professional opinion of an excellent architect of high standing, I find he also thinks its condition may occasion danger to visitors. Under these circumstances and under his advice the props complained of have been put up, so as to insure absolute security until the time arrives for taking further steps. The number of visitors always present in the autumn renders it difficult to proceed, and spring will probably have to be waited for. Before anything is done due notice shall be given, so that any interested in the matter may be able to be present and witness anything that the necessary disturbance of the soil may bring to light." In accordance with resolutions passed at a meeting of the Wiltshire Archaeological Society, the secretary (the Rev. A. C. Smith) has met a deputation from the Society of Antiquaries at Stonehenge, the object being to examine and report upon the best means of rendering secure the stones in danger of falling, and to consider the expediency of raising the trilithon which fell in 1797. Sir E. Antrobus has had the site surveyed by Mr. Cole, an architect, who directed the propping up of the isolated trilithon on the north-east side of the outer circle. No "restoration" will be attempted at present, and due notice is to be given before anything material is done.

THE TOWN COUNCIL of Newcastle-on-Tyne has appointed a committee to consider the subject of providing a new town-hall. The present building is, says the *Newcastle Chronicle*, utterly unworthy of the borough. From the very first it was an expensive blunder. It was erected in the wrong place; it was built on wrong lines; and it has never been an ornament to the town. Not only did it cost many thousands of pounds more than the original estimate, but large sums have to be annually voted in order to keep it in condition. During the last ten years, the outlay on the building has averaged no less than £630 per annum; yet such are still the defects of the structure that one of the Corporation officials a few weeks ago had a narrow escape for his life through being poisoned by sewer-gas. The question of providing new buildings was brought before the Council at its meeting last week. A committee was appointed to consider the propriety of purchasing the house and grounds in Northumberland-street and Bath-road which were formerly occupied by Sir John Fife, with the view of erecting thereon a municipal edifice that would do credit to the borough. If the existing town-hall could be levelled with the ground, so as to make one wide thoroughfare from Grainger-street to St. Nicholas' Church, the greatest improvement ever made in Newcastle would be effected.

An unusually large raft of timber was recently floated down the Hudson. It was 900ft. long and 34 wide, and contained 251 pine-logs, varying from 70 to 96ft. in length and from 18 to 30in. in diameter. The logs were cut during past winter in Ontario, Canada, near Capetown, Linden, and Onondaga. They were floated down to Toronto, on Lake Ontario, and on June 24 last they began their journey to Boston, in care of Capt. Edward Locke. They were made into a raft, and towed in three days and a half across the lake to Oswego, where they were separated into two rafts of six cribs each and a third raft of seven cribs. These were towed through the Erie Canal by John Wells, of Oswego. The journey occupied thirty-one days. The three rafts were then united into one large raft with two sections abreast, and floated down the river, travelling only on ebb tides. On its arrival at Gowanus Bay, Brooklyn, the raft was prepared for towing to Boston. The logs were chained together, and 113 logs from Pennsylvania were added, making a raft 1,300ft. long and 61ft. wide. The value of the raft was put at £5,000 sterling. The cost of towage was £700, or one-third less than it would have cost to send the logs by rail.

THE NEWCASTLE TOWN COUNCIL, at an adjourned meeting on the 14th, decided by 28 votes to 13 to give the three chief officers of their engineering staff—Mr. Fowler, Mr. Fulton, and Mr. Curry—six months' notice to

terminate their respective engagements, "in order that the engineering staff may be reconstituted on a more satisfactory and economical basis." For some time past considerable dissatisfaction has prevailed in Newcastle at the management of the engineering offices. Instead of there being one chief, there have been in reality three heads of departments without a master. With a house thus divided against itself, it was manifestly impossible that the affairs of the town could be conducted satisfactorily. Mr. Fulton, previously of Dundee, was appointed town surveyor in March, 1868, at a salary of £600. Mr. Lamb was then in the employment of the Corporation as property surveyor, at a salary of £700. A few years afterwards his salary was increased to £800, and that of Mr. Fulton, who was created borough engineer, to £700. Mr. Lamb resigned four years ago to take charge of the Grainger Estate, and the Council then determined to appoint a chief engineer, who should have sole charge of the works of the Corporation, and be known as the Town Surveyor and Borough Engineer. Mr. Alfred M. Fowler, the borough engineer at Salford, succeeded in obtaining the appointment, at a salary of £1,000 a year, and Mr. Fulton was made assistant engineer. This dual arrangement was found to be unworkable, and about eighteen months ago Mr. Fulton was created town surveyor with a separate office and staff of his own. Mr. Curry is the inspector of nuisances and superintendent of scavenging. The cost of the engineering staff at Newcastle reaches the large total of £4,451 per annum.

A CORRESPONDENT at St. Alban writes suggesting that, now that Sir E. Beckett's new west front of the Abbey has risen about 12ft. above the ground, it would be well to consider the desirability of removing the boundary wall on the south side of the nave, and that inclosing a small graveyard adjoining the south transept. If these were replaced by a light iron fence, similar to those on the north and east of the Cathedral a great improvement would be effected, and the building would be opened up to view. At the same time, the footpath through the graveyard on the north side could be opened up and joined across the west front to that already existing on the south side, thus providing a circular walk round the Cathedral.

A TEST of the strength and soundness of the completed portion of the Hudson River Tunnel was recently made. The new air locks at the river ends of the borings were closed and the air-pressure was gradually reduced in the portion between the locks and the shore. The test was satisfactorily borne, except by the unfinished part between the locks and the heading, about 30ft. in length. The escape of air from this portion by leakage allowed the silt to press in, crushing several feet of the iron shell which extended beyond the brickwork. The workmen had been withdrawn from this part of the tunnel before the pressure was reduced, and, except for the derangement of the extremity of the tunnel next the heading, and the pressing in of silt, no harm was done.

WE understand that a National Society for Preserving the Memorials of the Dead in the country parish-churchyards of England and Wales is in course of formation, and among those who have joined the society are the Earl Beauchamp, the Earl of Carnarvon, the Earl of Glasgow, the Earl of Northesk, the Lord Talbot de Malahide, the Bishop of Ely, the Bishop of Argyll and the Isles, the Right Hon. A. J. B. Beresford-Hope, M.P., Mr. Stanley Leighton, M.P., &c. It is proposed shortly to hold meetings in London. A wide-spread approval of the society has been received. Any persons willing to join are requested to apply to (and by whom all information will be given, and suggested rules sent) Mr. W. M. Vincent, Belle Vue Rise, Lower Hellesdon-road, Norwich.

THE VIENNA *Politische Correspondenz* says:—"The once famous cedar forest of Lebanon, formerly so extensive, has dwindled down to the dimensions of a mere thicket, numbering about 400 trees. To save it from complete destruction and preserve it at least in its present extent, Rustan Pasha, the Governor-General of the Lebanon, has issued a special ordinance, containing a series of stringent regulations calculated to check, if not put a stop to, the vandalism and carelessness of most travellers. It is expressly forbidden to put up tents

or other kinds of shelter within the district of the trees, or to light fires or to cook any provisions in their vicinity. No one is allowed to break off a bough or even a twig from the trees. It is forbidden to bring any beasts of burden, be they horses, mules, asses, or any other kind of animal, within the district. Should oxen, sheep, goat, or other pasturage cattle be found within the prescribed limits, they will be irredeemably confiscated.

Mr. FRENCH, of Museum-street, Warrington, has forwarded us one of his new pattern Solid Flame Gas-Burners, which, although so small, will readily boil 7 or 8 gallons of water, and at full power will boil a quart of water in a light kettle in five or six minutes, at an expenditure of one cubic foot of gas. The flame is solid with a brilliant green centre when working at full power, and according to the tests reported to the British Association of Gas Managers, the duty obtained is double that of an ordinary Bunsen. The new pattern is specially adapted for general domestic purposes, being designed to stand the roughest and hardest work, and it has the further advantage, when used for boiling, that the gas must be turned down, or the pots will boil over unless they are removed, thus preventing much of the waste of servants. It is unquestionably the best burner of its kind in the market, and will be found valuable in every household in which gas is used.

THE Portuguese Government has just issued an official announcement of an exhibition of objects of Spanish and Portuguese decorative art which is to be held in Lisbon in the coming month of November. The idea is entirely due to the Peninsular exhibition now open at South Kensington. The Spanish Government has consented to allow all the contributions now at that place to be transferred to Lisbon, and our own Government will reciprocate the action of Portugal by lending an extensive series of objects. It is hoped, also, that many of the private contributors to the Kensington gathering, both English and French, will, at the same time, allow their loans to be sent to Portugal. All the finest treasures of the Portuguese Crown will be exhibited, and the cathedral churches and convents will furnish a far richer series of objects than it was possible to send to London. The exhibition is to be held in the newly-constructed buildings destined for the museum of the fine arts in Lisbon.

NEARLY every variety of timber grown in the United States is found in Tennessee. This is owing to its great diversity of surface, which gives the State as great a diversity of climate. The difference of temperature at different altitudes is fully fifteen degrees, and the soil is of an equally diversified character. Hence, at different elevations in the same locality are found the white pine (*Pinus strobus*) of Michigan, the black walnut (*Juglans nigra*, of Indiana, and the white oak (*Quercus alba*, of tide-water Virginia. The magnificence of these forests in some parts of East Tennessee is unsurpassed anywhere in the United States. They reveal, as it were, in the exuberant fertility of the soil, and attain a size that is exceeded only by the giant trees of California. Oaks are reported in some sections 7 and 8 ft. in diameter, and poplar (tulip or whitewood) as large as 10 ft., and one of the larger trees as being 120 ft. high, and 2 ft. and 7 in. in circumference at the butt. From it were cut 6 twelve-foot saw-logs that measured an aggregate of 11,120 ft.

CHINA ink is known to consist chiefly of lamp-black and linseed-oil, with some binding material. Dr. Precht, of Silesfurt, says the lamp-black is got by burning different oils, with limited access of air, the quality depending partly on the raw material, partly on the kind of oven used. The inferior products are applied in printing. As a binding material, the Chinese often use the sap of various plants, but it has been ascertained that the black ink contains only animal gelatine and no gum-arabic. The usual addition of camphor and musk does not affect the goodness of the ink. In making the black ink, the drying mixture (which is compounded according to precise rules) is carefully watched. Most of the China ink sold is imported from China, but some German houses make the ink, and of excellent quality. China ink, used in drawings which often receive water-colours, should be highly insoluble in water. It is sold in so, but, according to Dr. Precht, if

bichromate of potassium (say, a 2 per cent. solution) be used instead of water in the rubbing process, the drawing, after one or two hours' exposure in daylight, becomes resistant to water.

CHIPS.

A building at Haddington, till recently known as the Knox Free church, has been reconstructed internally to serve as a public free library, from the plans of Messrs. J. and F. Farquharson, architects.

The town council of Leamington received, last week, plans prepared by the borough surveyor for alterations and additions to the waterworks, and decided to submit them to Sir F. J. Bramwell, C.E.

At a meeting held at Kirkcaldy on Thursday week, plans by Mr. Kinnear for the extension of the manse, at a cost of £520, were approved.

Major Hector Talloch held an inquiry, last week, at the town-hall, Folkestone, into an application by the town council for sanction to borrow £11,000 for the purpose of street improvement, the purchase of the King's Arms Inn for the widening of Guildhall-street being the main object for which the money is required.

A series of Turkish, Russian, and medical baths have just been completed and opened, in connection with the Imperial Hydropathic Hotel, Blackpool. The work has been carried out under the supervision of Mr. Constantine, of Manchester. The architect is Mr. F. R. Barker, of Manchester; and the contractor Mr. Smith, of Blackpool.

At a meeting of directors of the Highland Railway Company, held last week, it was resolved to promote a Bill in the ensuing session of Parliament for the construction of a line of railway from Keith to Buckie, with an extension to Farskane, which is within half a mile of Cullen. The line will be 17½ miles long, and of easy construction. It is anticipated that the cost will be a little over £5,000 per mile.

By the completion of a line of railway 200 miles in length from Krasnovodsk to Kizil Arvat, the Russian Government have finished the first section of the Trans-Caspian Railway, which is intended to bring the territory recently conquered from the Turkomans into direct communication with both the Caucasus and the interior of Russia.

A stained glass window has this week been placed in St. Nicholas parish church, Newbury. Messrs. Hardman and Co., of Birmingham, were the artists.

A Methodist New Connexion Chapel was opened in Eldleston-road, Crewe, on Sunday week. It is Gothic in style, is seated with pitch-pine benches, and has cost £700. Mr. Bailey, of Wilmslow, was the builder.

The sewerage of Keulworth is rapidly progressing, the tank and outfall works being on the point of completion, and a large portion of the main sewers are laid. Mr. Fell is the contractor.

In the arbitration case Sir W. Hart-Dyke v. the Darent Valley Main Sewerage Board, heard on the 30th ult., at the Institution of Surveyors, and fully reported in our issue of the 9th inst., p. 347, the umpire (Mr. F. Vigers) has awarded Sir W. Hart-Dyke £7,950 as compensation for the damage done to the grounds of Lullingstone castle by the sewer laid through them. £20,000 was claimed.

At a heritors' meeting held at North Berwick on the 15th inst., tenders amounting in all to £3,459 were accepted for the erection of the new parish church.

A new mansion, Early English in style, has just been completed for Sir H. W. Ripley, near Badstone, at the confluence of the Clun and the Teme. Mr. Harris, of London, is the architect; Messrs. W. Cabott and Co., of London, are the contractors, Mr. W. C. Carter being their managing foreman; and Mr. Old is the architect. On Saturday week allayed on the building, to the number of 130, were entertained at dinner by the owner.

One of the largest caissons in the world was successfully floated across the 100 ft. entrance of Milford Docks by electric light early on the morning of Wednesday week. It effectually shut out the water. Its dimensions are—length, 100 ft.; height, 48 ft.; breadth, 15 ft. Its weight is 100 tons.

A suspension passenger-bridge over the ferry at Cromdale, near Aberdeen, has just been finished. Messrs. Harper and Co., Aberdeen, were the engineers, and it has been erected under the personal superintendence of Mr. John Harper, of Seaford. The structure is of galvanised steel rope, and is 195 ft. in clear span.

A new eye, ear, and throat hospital at Shrewsbury, erected at a cost of £11,000, was opened on Wednesday.

Cambridge is at last to have a new post-office. After several years' negotiations, the Government have at length decided to purchase for this purpose a capacious site at the Petty Cur end of St. Andrew's-street, whereon stand an inn and some of the oldest houses in Cambridge.

A dispute between the Crediton School Board and Mr. William Dart, concerning a charge made by the latter of £74 14s. 10d. for certain "additional works" done in connection with the erection of an infants' school at Landscore, has been settled by Mr. C. E. Ware, architect, of Exeter, to whom the matter was submitted as arbitrator by the common consent of the parties interested. Mr. Dart's contention was that he was entitled to make the above-named charge under a clause in the contract which gave him the power to account certain works done under the direction of the architect, and for which the latter certified as "additional," and, as such, outside the estimate of the said contract. Certain members of the board disputed Mr. Dart's claim, and the others were induced to refer the subject to arbitration, with the result that an award has been made for the amount claimed, and the ratepayers will be mulcted in the costs of the reference.

An increasing characteristic feature of the business portion of New York is its lofty buildings for offices. Of the score of office buildings now going up or nearly finished there is only one—the Stock Exchange, four stories in height—which is less than twelve stories high. Lifts are a common necessity to a New York business man.

A Local Government Board inquiry was held at Evesham Town-hall last week, with reference to an application from the Town Council for sanction to borrow £1,000 for extensions and improvements to the gasworks. Mr. Scott explained the scheme, as representative of Mr. Bowers, the engineer, from whose plans it will be carried out.

The Roman Catholic Church at Haslingden, near Manchester, was reopened last week, after the addition of chancel, side-chapels, and a gallery to nave.

The Local Board of Richmond, Surrey, have adopted the recommendation of Mr. Homersham, their water engineer, that the artesian well should be deepened from 400 ft. to 1,200 ft. by a central bore. The tender of Messrs. Mather and Platt has been accepted, and the work is now in progress. Mr. Peirce is the resident engineer, and Mr. Harrup, the contractor's foreman.

A correspondent informs us that the recent gas exhibition at Weston-super-Mare was not "the first display of the kind in the West of England," as a similar exhibition was held at Shepton Mallett two years since.

An improved jointed pitch-board for squares has been patented by Frederick N. Marvick, of Palatka, Fla. The invention consists in a carpenter's square provided with a middle-jointed rule slotted in both sections, and connected by a clamp bolt and nut with the slotted arms of the square.

New Sunday-schools are in course of erection in connection with the Wesleyan chapel, Collegepark, Lewisham. The buildings will be Early English in style, and will accommodate 300 children in the main room, and its two classrooms, and 100 others in the infants' room. Mr. Charles Bell, of Old Broad-street, E.C., is the architect; and the builders are Messrs. D. and R. Kinnaird, of Lewisham.

The Norwich Town Council agreed on Monday to accept the tender of Messrs. Crompton and Co., of London, for lighting several of the principal streets of the city by means of electricity for twelve months at a cost not exceeding £400. It was stated that nearly one hundred gas-lamps would be superseded, and that the extra cost of the light would be only about £100. The cost of this experiment was, it was explained, less than half that of similar experiments made elsewhere; and the experiment already made in lighting the market-place has proved eminently successful.

The members of the Bradford Historical and Antiquarian Society visited the residence of Mr. John Holmes, at Holmstead, Roundhay, near Leeds, on Saturday last, for the purpose of inspecting his extensive and valuable collection of pre-historic and artistic treasures. The collection includes a valuable library (especially rich in antiquarian works), antique furniture, tapestry, implements of warfare, pre-historic relics, and rare examples of ancient pottery, particularly a unique collection of ware from Cyprus.

New schools for St. Paul's, Hammersmith, are about to be built on the south side of Hammersmith-road. The contract has been taken by Messrs. Parnell and Co.

The local authority of Kirkintilloch adopted on Monday plans, and a report by the engineer, Mr. Copeland, for the formation of a water reservoir, at an estimated cost of £5,000.

The tower of the parish-church of St. Helen, at the village of West Keal, near Spilsby, Lincolnshire, fell with a crash the other day, and is now a mass of ruin. Nearly the whole of the tower fell to the south in the churchyard, and clear of the edifice. The tower was built principally of sandstone, and possessed a peal of five bells, which now lie among the debris. The church of West Keal is quite a landmark over the fens, being situated on an eminence overlooking them, and the tower was a conspicuous object for miles around.

The Mexborough local board adopted on Tuesday plans by Mr. George White, C.E., for the proposed sewerage works and disposal of sewage.

At a meeting of the Harbour Commissioners of Burntisland, Fifeshire, held on Tuesday, it was decided to proceed at once with several pressing works recommended by Messrs. Meik, C.E., and of Sir James Falshaw, and Mr. Sheppard in a special report. The cost of the works is estimated at between £8,000 and £10,000.

Epps's Cocoa.—Grateful and Comforting.—By a thorough knowledge of the natural laws which govern the operations of digestion and nutrition, and by a careful application of the fine properties of well-selected Cocoa, Mr. Epps has provided our breakfast tables with a delicately-flavoured beverage which may save us many heavy doctors' bills. It is by the judicious use of such articles of diet that a constitution may be gradually built up until strong enough to resist every tendency to disease. Hundreds of subtle poisons are floating around us ready to attack wherever there is a weak point. We may escape many a fatal shaft by keeping ourselves well fortified with pure blood and a properly nourished frame. *—Civil Service Gazette.* Made simply with boiling water or milk. Sold only in Packets (labelled)—James Epps and Co., Homoeopathic Chemist, London.—Also makers of Epps's Chocolate Essence for afternoon use.

Lamplough's Pyretic Saline is refreshing, most agreeable, and the preventive and curative of FEVERS, BILIOUSNESS, SMALLPOX, SKIN DISEASES, and many other ailments. Sold by chemists throughout the world, and the Maker, 113, Holborn Hill. *Use no substitute. See Medical Testimony.*

Holloway's Pills.—These famous Pills purify the blood, and act most powerfully, yet soothingly, on the liver, stomach, kidneys, and bowels, giving tone, energy, and vigour to the whole system. They are wonderfully efficacious in all ailments incidental to females, and, as a general family medicine, are unequalled.

HUGHENDEN, BECKS.—For general repairs and renovation of Hughenden Manor, for the executors of the late Right Hon. the Earl of Beaconsfield, K.G.:—
Liley and Wood (accepted).

HUNTINGDON.—For alterations and additions to a house on the Market Hill, Huntingdon, for new post office. Mr. R. Hutchinson, architect:—

Bunting, A., Fenstanton	£760 0 0
Howard, J. H., Huntingdon	730 0 0
Thackeray, G., Huntingdon	757 0 0
Balmer, W., Huntingdon	683 0 0
Markham & Mason, Godmanchester	684 0 0
Wade and Edey, St. Neot's	647 0 0
Lord, C., Huntingdon	630 0 0

INVERKEILLER, FORFARESHIRE.—For improvements of Clance Inn, Inverkeiller, for Colonel Rait, C.B., of Anniston. Messrs. J. MacLaren and Son, Dundee, architects:—

Accepted Tenders.	
Mason's work:—Ramsay and Gordon, Arbroath.	
Joiner's work:—Scott, Arbroath.	
Slater's work:—Brand, Arbroath.	
Plumber's work:—Brown, Dundee.	
Plasterer's work:—Middleton and Donald, Arbroath.	
Total cost, £325.	

KENSINGTON.—For the erection of seven houses and shops in Kenway road, Earl's Court. Mr. Hugh Roumieu Gough, F.R.I.B.A., 6, Queen Anne's Gate, St. James's-park, S.W., architect. Quantities supplied:—
Belham and Co., Buckingham Palace-road* £7,404 0 0
(* Accepted.)

KETTERING.—For the erection of six cottages in Ford-street, for Mrs. Bellamy:—

Manby	£1,155 0 0
Payne and Son	1,149 0 0
Henson, C. S. F.	1,100 0 0
Barlow, E.	1,074 0 0
Henson, H.	1,047 15 0
Henson, G. V.	1,000 0 0
Shurman, C. (accepted)	940 0 0

LEINTWARDINE, HEREFORD.—For construction of works of sewerage (2 mile in length) and sewage disposal for the special drainage district in the parish of Leintwardine (north side) for the Ludlow Rural Sanitary Authority. Quantities supplied. Mr. James Hine, surveyor:—

White, J., Birmingham	£650 4 0
Overton, Leintwardine	482 0 0
Lewis, W., Carmarthen	464 15 0
Birrell, W., Shrewsbury	463 0 0
M'Kay, J., Swansea	439 0 0
Russell, H., Ludlow	427 0 0
Davis, Ludlow	407 6 2
Hughes, H., Dudley	394 0 0
Harris, J., Shrewsbury	320 0 0
Aston, J., Wolverhampton	227 14 0
Tragne and Co., Birmingham*	217 10 0

* Accepted.

LEWES.—For rebuilding Bridge-wharf Brewery, Lewes, for Messrs. Harvey and Son. Mr. W. Bradford, architect. Messrs. J. and A. E. Bull, surveyors:—

Building:—	
Patching and Son, Brighton	£1,388 0 0
Howard, Brighton	4,304 0 0
Rewaters, G. H. and A., London	4,059 0 0
Cheesman, Uckfield	3,990 0 0
Chappell, J. T., London	3,976 0 0
Peartless and Son, Eastbourne	3,910 0 0
Card and Son, Lewes (accepted)	3,808 0 0
Herman & Floyd, Lewes (irregular)	3,800 0 0
Knight, Lewes	3,643 11 5

Engineer and Millwright's work:—	
Shears and Sons	1,248 0 0
Worsam and Son	1,230 0 0
Pontifex, H. and Sons	1,190 0 0
Ramsden, R. and Son	1,159 0 0
Bennett, J. J. and Son	1,120 0 0
Pontifex and Wood (accepted)	790 0 0

Coppersmith and pipe-work:—	
Ramsden, R. and Son	1,178 0 0
Worsam and Son	1,121 0 0
Bennett, J. J. and Son	980 0 0
Shears and Sons	944 0 0
Pontifex, H. and Sons	900 0 0
Pontifex and Wood (accepted)	790 0 0

Backwork:—	
Worsam and Son	327 0 0
Bennett, J. J. and Son	285 0 0
Ramsden, R. and Son	249 0 0
Oxley and Co. (accepted)	221 15 0
Whibley, R.	246 10 0
Pontifex, H. and Son	200 0 0

LEWISHAM, LONDON, S.E.—For construction of 9in.-in-cement brick water-culverts, about 4ft. by 3ft. wide and 5ft. long:—

Hairyman, T. W., Lewisham	£270 0 0
Hall and Gammon, Lewisham	240 0 0
Amer, G., Gifford	230 0 0
Wheeler, J., Lewisham	198 0 0
Woodham, H., Catford (accepted)	175 0 0

LLANDUDNO, WALES.—For amend-d tenders for contracts No. 1 and 2, for the Llandudno Pier Works:—
Smith and Pilkington, Bacup, for No. 1 (accepted).
Woodall, S., Dudley, No. 2 (accepted).

LONDON.—For new schools in connection with St. Andrew's Church, Thornhill-square. Mr. W. Smith architect:—

Larke	£1,870 0 0
Dunford and Langham	1,680 0 0
Matlock	1,671 0 0
Harper	1,632 0 9
Shurmer	1,583 0 0
Cole and Chant	1,555 0 0
Stevens	1,548 0 0

LONDON, E.C.—For the erection of house, &c., at Hatton-garden, for Messrs. R. and Co. Mr. Ansell, architect:—

Patman and Fotheringham	£2,750 0 0
Laurence	2,457 0 0
Anley	2,320 0 0
Godden	2,310 0 0
Macey and Son	2,253 0 0
Cox	2,218 0 0
Jay	2,150 0 0
Langmead and Way (accepted)	2,150 0 0

LONDON, E.C.—For taking down and rebuilding Wellington Foundry, Charles-street, City-road, for Mr. B. Slater. Mr. T. Mdbourn, architect:—

Sabey and Son	£1,265 0 0
Marr	1,264 0 0
Staines and Son	1,186 0 0
Langmead and Way	1,111 0 0
Fernley	1,085 0 0
Palmer and Sons	1,068 0 0
Royal	1,066 0 0
Anley	1,015 0 0
Snow and Co.	1,033 0 0
Conder	1,029 0 0
Crabb	998 0 0
Salmon, W. and H.	924 19 9

LONDON, N.W.—For additions and alterations, St. Andrew's house, Regent's Park. Mr. Arthur Vernon, architect, 26, Great George-street, Westminster, and High Wycombe, Bucks. Quantities by Mr. Walter L. Vernon, Hastings:—

Bird	£5,436 0 0
Wargstaff and Son	5,121 0 0
Holland and Hannen (accepted)	4,976 0 0
Perkins	4,690 0 0

LONDON, S.W.—For alterations and additions to the George IV. Tavern, Vauxhall Bridge-road. Quantities by Mr. E. Crutchley, 3a, Post's Corner, Westminster:—

Boyce	£715 0 0
Foster	710 0 0
King, W., and Sons (accepted)	698 0 0
Stihng	681 0 0
Badcock	604 0 0
Quinn	588 0 0

THE BUILDING NEWS.

LONDON, FRIDAY, SEPTEMBER 30, 1881.

CITY IMPROVEMENTS.

IN one part of the City architects and builders seem more than usually active just now in improvements and alterations—namely: the area lying between Gracechurch-street on the west, Leadenhall-street on the north, and Fenchurch-street on the south. A few years ago this locality could boast of many of the old timber-fronted houses which had come down from the 16th and 17th centuries. Near Hide and Leather-market six old half-timbered buildings were pulled down within the last 20 years which antiquaries were sorry to lose; and only a short time since we described the discovery of some remarkable remains of Roman and Mediæval walls on the site of Leadenhall Market, which was then being excavated for the new buildings. A carefully-plotted plan of these discoveries was made by the clerk of works; in one case a wall of nearly 13ft. thick was discovered, and above this were the remains of a thinner wall of Roman brick, well bonded, with footings of a yellowish sandstone, and these walls appear to have had their foundations, in some instances, 24ft. below Gracechurch-street. Another rather peculiar feature of these foundations, probably connected with some important monastic buildings, was that they were composed partly of Roman tile and partly of Kentish rag, those materials alternating in layers. We understand several antiquaries have been to inspect the work, and their conjectures do not yet appear to have established any satisfactory theory to account for the strange admixture of Roman and Mediæval masonry at this part.

It is quite certain that Leadenhall Market was one of great antiquity, and it has belonged to the Corporation for more than two centuries. It consisted of an area of about 3,900 square feet; but, around it, a much larger market has, of late years, sprung up. The Leadenhall Market and Improvement Bill was passed for the purpose of meeting the new requirements by abolishing the old market and the erection of a larger one, as well as the improvement of the site and neighbourhood. We believe the Bill passed on the condition that the new market was to have an area of not less than 25,000ft. The site of the new erections, which we now describe, is confined to the old Half Moon-passage leading out of Gracechurch-street, and a part of Leadenhall-passage; and the Corporation would have done well to inclose the greater part, if not the whole, of the space between Half Moon-passage and Leadenhall-street, which, we understand, is to be let. The corner of Gracechurch-street and Cornhill has long been a trouble to the police. The pressure of traffic is daily so great at this corner that it is time something was done to avert danger; and it appears to us a circus ought to be formed here, if such a necessary enlargement has not already occurred to the civic authorities. Now is the opportunity; and we hope the corporation will not lose sight of the urgent value of this street improvement. The block of houses between the Half Moon and Leadenhall-street has been taken down, and there is a chance—if only one idea, that of a magnanimous spirit, ruled the Corporation—for something to be done to atone for this long-neglected centre.

The plans, which have been carried out under the supervision of the City architect,

Mr. Horace Jones, though still incomplete, show a partial realisation of a scheme which is intended to include a considerably larger area than now embraced. From the Half Moon-passage in Gracechurch-street the eye is carried through a long arcade 30ft. wide of intended shops, which is slightly diverted from the straight axis at the eastern end or Lime-street entrance. These shops will each be about 15ft. square, and three stories in height. This main arcade is intersected by another shorter arcade, the north end of which forms an entrance to the present Leadenhall Market. At the crossing is an octagon, which will be surmounted by a domical roof, and the cross arcade will, eventually, be carried southward. The whole underground area forms a series of vaulted basements or cellars on each side of a wide corridor, also arched in brick in two widths, which runs underneath the floor of arcade. These vaults are lofty, and will be lighted by glazed openings, partly in the shops or stalls, and partly from the corridor above in front of stalls. The arches are flat, of brickwork, supported on cross girders of iron, and by a longitudinal wall, with openings along the centre of the corridor. At the extreme end, near Gracechurch-street, the thick wall of Roman brick was found: this has been left, and will be inclosed as a relic of the discoveries. A considerable quantity of the rubble of the old walls which had to be removed has been reused in the basement. On the ground-floor the side-shops are constructed of brick side-walls; the fronts having cast-iron stanchions between, cast in the form of pilasters, which carry the principals of the roofing of arcade. Between the shops will be timber-framed and cemented; and there will be two stories above each shop, the upper one being an attic over the guttering of the roof. We can form only a general and imperfect idea of the effect of the arcade at present. The roof is constructed on the Mansard principle with two slopes; and an arched rib springs from each pair of opposite pilasters, while the lower principals have louvred openings, which will afford ventilation and prevent glare. These principals are of massive scantlings. Wrought-iron girders are largely used in the cross-beams and flooring. At the crossing of the arcades the angles of the octagon have large three-quarter-fluted columns of a Composite order, of cast iron, with entablatures; and the main entrance from Gracechurch-street is pronounced also by four columns of a similar design, which are placed at a wider distance apart than the width of arcade. There will be an arched entrance here, and, on each side, there will be, we understand, a sort of pavilion crowned by Mansard roof or a cupola. Externally, the elevations exhibit red brick fronts and stone dressings with stone pilasters between the shops. These are of three orders, and are similar to the new market buildings in Farringdon-road. The pilasters look rather small and weak in the portions already finished; but the new market is so completely hemmed in by the old buildings that we refrain from passing, at present, any opinion on the architectural merits of the new structure. The effect on the locality of which this market will form the centre can hardly be estimated. Unfortunately, the Bills passed for improvements of this kind are dealt with in a very piecemeal fashion. Each parish or district, and each owner of property, has a voice; but these interests are so often inimical to public views, and they so often clash, that an improvement of this sort can only be judged when it is fully before the public.

At the corner of Fenchurch-street and Lime-street several old houses have been pulled down, and the space is to be let for shops and offices. The area abuts close to several properties, the owners of which have been prudent enough to label their windows

"Ancient Lights." Lime-street is an old, narrow, and tortuous thoroughfare, and one of the ends of the new market arcade will open into it. About half-way down is a new block of offices in red brick, with reddish sandstone dressings, in which the commercial character has been well expressed by wide windows; but the most noticeable features about the façade are the red terra-cotta stringcourses between the stone lintels; these have rows of conventional flowers. There is a deep corbel table at the top, in warm sandstone, and the gabled dormers are relieved by red tile or terra-cotta ornament in courses, and by green-painted bargeboards. The wooden window-frames are painted also a bluish green. As an example of red brickwork, treated in a semi-Domestic or Gothicised style, it is worth mention. Several plots of freehold land are to be let between Lime-street and Fenchurch-street-avenue, belonging to the Carpenters' Company. Many stone-fronted buildings let as offices have been lately erected near the avenue, which are remarkable for some breadth of treatment. One, with an open loggia on the top story, the windows being set back, is quite Venetian in its style and details, and the stone ashlar obtains relief by the breadth of shadow of the upper story, the polished red granite shafts of the windows, and the discs of coloured marble introduced in a broad band of low relief panel-work between the windows. The balconette, on massive corbels, is another Venetian feature. The value of property in this street has increased much of late years, and when the market entrance has been made, we may expect the houses on the west side to be set back, and the roadway widened.

In Rood-lane, a block of chambers of red brick, in Queen Anne style, erected some time since, is worth mention for the manner in which wide rather flat-canted bay windows have been introduced in a narrow street. These bays, of woodwork, are recessed within the piers of red brickwork, which slightly project, and are finished at the top by pediments with carved brick swags of foliage in their tympani. The bays or recesses are arched over at the top. Mr. A. Peebles was the architect, and an illustration of the building, though not exactly as carried out in detail, will be found in our volume for June 20, 1879. The entrance, of stone, is well managed, and there is a degree of refinement in the details. In another narrow house-front in Fenchurch-street, breadth has been sacrificed to crowding of pilasters and details—a sort of elevation which tires rather than satisfies. One of the most recent conspicuous buildings in this part of the City is Leadenhall House. It occupies a large frontage to Leadenhall-street. The façade over the shopfront consists of a rusticated mezzanine story, on which rest three-quarter columns of the Corinthian order, supporting a broken entablature. These columns embrace two stories. Above there is a richly-carved attic. The centre is emphasised by a slight projection of the main order, with disengaged columns flanking a bay window. We notice this front (which will be found illustrated Sept. 26, in our volume for 1879) chiefly for its ornate Italian Renaissance features, and for the employment of red and grey polished granite in the principal stories. The granite shafts of the columns are relieved by piers of the same material, and the tints produced by the admixture of material has a rich but harmonious effect. For London street-fronts, the style is too elaborate and gorgeous, and a rather flatter treatment would have stood the atmosphere better. The large quantity of carved work will, we fear, soon become coated with soot, and even the use of polished granite of some kinds has not favoured the cleanliness which architects at one time anticipated, for we

find, in numerous instances of its employment, the polished surface eaten away by the corrosive acids of the smoke, and speedy disintegration following.

The junction of such important thoroughfares as Leadenhall-street and Fenchurch-street, with Aldgate High-street, ought to be enlarged, and, indeed, the same necessity exists for widening the approaches here as it does at the western *embouchure* at the junction of Cornhill and Lombard-street. As a portion of the great City highway, running east and west, Leadenhall-street is a most important link of communication, and ought to be dealt with in any general scheme of City improvement.

THE USE OF COLUMNS.

IT is an old charge against modern architects that they are constantly borrowing features from old buildings without regard for their original use. If this assertion be true of one thing more than another, it is in the employment of columns. Most middle-age men remember when porticos were all the rage—when every church, chapel, and conventicle had its front decorated with columns carrying a pediment, in accordance with one or the other of those arrangements found in Greek temples, otherwise “in antis,” a “prostyle,” an “amphiprostyle,” a peripteral or a “pseudo-peripteral,” so named with reference to the positions of the columns, but without any relation whatever to the plan or uses of the building. Even the humblest structure of the kind had its two or four engaged columns *in antis*, while of more ambitious edifices we have examples all over London, and several on the south side of the Thames in Waterloo-road, at Kennington, and at Brixton. Except in the case of a projecting portico, which afforded a shelter as well as an entrance, there was nothing to urge in reason for the use of lofty columns which had to be constructed of large blocks of stone, and only to mimic a heathen temple and to carry a prolongation of the main roof. When funds did not admit of blocks of stone, brick encaused with cement became the substitute for these outward semblances of Classic grandeur, till people began to see the absurdity of using material in so extravagant and ambitious a manner only to adorn one front, while the other three sides were starved to a condition of bare meagreness painful to behold. In course of a few years this mania for tetrastyles and hexastyles passed away; but there was left still a desire to employ the “orders” in a less ambitious way, in subservience probably to the ruling of another style, the Italian. They were constantly being tacked on the fronts of banks, insurance offices, town halls, and other secular buildings, but never in quite so obtrusive a manner, for the sham portico of the purist had tired everyone of impositions in architecture, which not only were exceedingly gloomy and heavy for our climate, but very costly when any alterations were contemplated. Accordingly, the Italian mode of employing the column became general; smaller shafts were used, and these could be constructed of stones of less size, or of monoliths of granite or marble. The substitution was a step in the right direction, for there was less incongruity in building small shafts of bricks and cementing them, than in obtaining materials which our quarries were taxed to supply, but a more important consideration was that architects could use a columnar treatment without being obliged to space their openings at certain intervals, as the rules for intercolumniation and height of orders were not so binding, and, consequently, the plan suffered less by this more pliant use of the column. The Gothic mania assisted, it must be admitted, largely to

loosen the restrictions of academic rule, and to make architects feel that they could introduce the column as a feature to give richness and depth to a façade without being fettered by considerations of conforming to any particular type or Vitruvian canon. The late Sir C. Barry was the first to introduce what is called the Florentine school of Italian; and this mode of arranging façades consisted in relieving masses of plain wall by appropriate decoration, in which the column was sparingly employed, and only in strict subservience to plan and fenestration. It was very different to the Venetian method, in which orders were piled on orders, a type of composition aiming at greater freedom, richness, pomp, and ornament of a super-added kind; and modern buildings seem to have inherited the peculiarities of both these types. The Venetian has been always the most popular style of architecture, in both of the great divisions of art, for it always preferred floridness of features and pompous effect to intellectual beauty. There is, indeed, another school which made the orders dominant—namely, the Roman, but it lacks the refinement of the Florentine and the playful fancy of the Venetian, and has been generally employed for churches, in which a large order is used with an attic above. The leading characteristic of the Roman columnar façade is that it obliterates, as one writer says, the distinction of several stories. A column resting on a low plinth or pedestal rises to the full height of the building, or nearly so, and the best examples probably in England we have of this mode are Greenwich Hospital and the Royal Exchange.

We have sketched briefly these three leading forms of columnar composition with the intention of showing that the two former are the only reasonable ones for modern practice to follow. As we are gradually returning to the wholesome doctrine of designing in the materials ready to our hand, brick and terra-cotta, it seems unnecessary to say that the orders we employ ought to be executed to a scale in keeping with the limited stone we possess. The purpose and use of the building ought to dictate the extent of the use of columns, and the degree of massiveness or solidity they should have. A narrow façade in a street intended for an ordinary shop, is not the right place for columns, and such decoration is best confined to pilasters. Even in more extensive façades, the character of the building appears to be the only appropriate justification for them. A number of stories, united by a single order, belies the purpose of a structure, for it assumes an appearance of dignity not compatible with the object for which it was built; while, if each story has an order of columns, the effect is to destroy the unity of the front by dividing it into a number of small parts. The pilaster mode of division is less open to objection, yet this method is always weak when applied to several stories. In structures of a public or monumental character, we have the best justification for the use of the column as a feature in design; an element of strength and majesty seems to be wanted; something to impart to the bare outer walls an appearance of solidity and depth, and as a means of emphasising a prominent part of the external design. The Cinque-cento artists, with all their faults and unpleasing combinations, had yet the moderation to use the column in the least offensive manner. It is true they combined the arcade with the columnar ordinance in a manner set them by Vitruvian models, but they reduced the orders in scale and made them less objectionable than the Roman. In like manner broken entablatures and stylobates, and engaged columns—other devices which have been repeatedly made the subject of criticism by purists—show to what an extent they endeavoured to make

the orders adapt themselves to façades in which lightness and decoration were required. We do not assert that the attached or engaged column is the best form of use, but we think the Cinque-centist was quite justified in applying columnar ordinances in this manner, where insular columns would have been either heavy or too costly. The façades of Palladio, Vignola, and Perrault, are characterised by a degree of elegance which leave nothing at all to be desired, and of English adapters we place Sir W. Chambers in the foremost rank. The orders were never superfluously introduced, but placed with sufficient intervals of plain walling to give them force, richness, and a meaning. It would carry us too far to mention examples of modern buildings which carry out these principles, and probably in London there are only two buildings, one the work of Inigo Jones, and the other of Chambers, to which we need refer.

It is not necessary that columns should be placed in rows at regular intervals, any more than it is that they should be piled upon one another. Many architects have a notion that they cannot have too many or thick a series of columns, regardless of the principles we have started with—that these features should always be subservient to plan, and other necessities of a façade. Of course, where great solidity, depth of recess and shadow are required, thick-set columns may be desirable; but in modern architecture the requirements of ample light, if no other, suggest more open columniation. Again, for buildings of an official character; the formula of a rusticated basement and an order above is both dignified and expressive; while for residential structures and offices, superposed orders might be used. The chief thing is moderation and refinement, and, perhaps, the French style of Cinque-cento, as that seen in parts of the Louvre by Perrault, who was the Palladio of the French school, affords us some of the best models. It is unnecessary, because it is impossible, with the many diversities of composition, to lay down rules for the interspaces of columns or their proportions. What may be desirable for insulated columns would be heavy and over-massive in attached orders. What is called the arcostyle arrangement, or that in which a wide intercolumniation exists between coupled columns, is a very artistic and favourite mode of treating a centre by the artists of this school. The columns are often placed *in antis*, and the wall is either attached or disengaged from the columns, leaving them free. The porticos of Somerset House are thus treated.

There is one point about which architects have never agreed thoroughly—viz., with regard to the practice of piling orders on one another. In designing columnar ordinances of this kind, how often has the designer felt perplexed about the correct rule to follow in the superposition of his columns. At the angles of a composition of this sort the difficulty is felt to be greatest, and the question arises, Should the plinth and pedestals of the upper order project over the upper ends of the lower shafts, or be set to a vertical line with them? The practice of the leading Italian architects in arranging order above order is that the upper column shall have a diameter equal to the superior diameter of the column below it, so that, in fact, the plinth of the upper pedestal projects over the top of the lower shaft. By this arrangement a verticality of the shafts at the corner is preserved. A learned writer considers a more rational mode would be to carry the diminution through the columns of every story, so that the columns of each order would be diminished in regular gradation. Such a diminution would, however, reduce the upper orders very much, and the angles, when finished with pilasters, would appear to batter inwards. Two instances of the former plan

may be mentioned—one, the double order to the Church of St. Mary in the Strand, and the other of the façade of the new War Office at Whitehall, a building confessedly designed under difficulties by a Gothic architect. Of course, in all cases, the axes of the several orders of columns ought to be preserved in a vertical line, and it must be generally acknowledged the projection of plinths and pedestals at the corner has a rather awkward effect, and requires some forethought on the part of the architect. We have confined our remarks to façade arrangements; columns in the interior of buildings are regulated, generally, by similar considerations, and to them we do not now refer.

THE PARIS ELECTRICAL EXHIBITION.

IT has rarely been our lot to meet with any catalogue so badly drawn up as the "Guide Officiel" to the exhibition now being held in Paris. If ever there was an exhibition requiring a carefully-prepared classification of the various exhibits, and a condensed description of the most noteworthy of them, it is this; yet it is not too much to say that an ordinary visitor, unless he happens to have the advantage of being acquainted with one of the officials, may wander about the building for hours, with the catalogue in his hands, without being able to gain a clear idea of what is presented to his view. We think, also, that exhibitors have grave cause for complaint in the fact that a portion of the official catalogue is devoted to a most unfair puff of Edison's exhibits, in a description which bears on its face evidence of the most superficial knowledge of the history of electric lighting. Taken as a whole, however, the exhibition is a most wonderful one, and comprises by far the most complete collection of the applications of electricity for lighting purposes, and for the transmission of power, that has ever been got together.

The huge building of the Palais de l'Industrie is in the evening one blaze of light from the profusion of electric lamps displayed, and the ear becomes wearied with the incessant noise of saws, pumps, boring machines, sewing machines, pianos, and French horns, all worked by electricity. The ground-floor of the building, which is lit by a number of arc lights depending from the roof or elevated on tall standards, is given up to the machinery for producing the electricity, and to various means of utilising it, which are all extremely interesting to the electrician and engineer; but the various galleries on the upper floor and the vestibule constitute a zone which is of especial interest to the architect, as here are shown various methods of applying the electric light to interiors, and as the Commissioners of the Exhibition have with excellent judgment given up the different rooms to different inventors, to do the best they can with them, the various systems of lighting can be easily compared with each other. To take the large arc-light systems first, Messrs. Siemens Brothers show in the vestibule a magnificent chandelier of bronze and steel combined, which holds six of their large lamps enclosed in thick ground-glass globes, and the same firm have shown in some of the galleries various methods of using their lamps on standards or on brackets. The Jablochhoff Company also exhibit numerous standards and brackets for supporting their lamps. The picture-gallery is lit by ten French lamps of a new type, called the *Lampe-Soleil*, in which the electric arc is made to ignite some very refractory substance which burns away together with the carbons. The effect of this light is very good, and the tints of all the pictures are quite as distinct as when seen by daylight. Six single lamps, of

the de Meritens type, depending from the ceiling, are used in one of the rooms, and in another, nine of the Jamin lamps—which are on much the same principle as the Jablochhoff—are used both in a chandelier and on brackets. The Société Espagnole light up one room with four hanging lamps, and in another room six small Gérard lamps are used. It would be tedious and hardly suitable to this journal to describe the points wherein these lamps differ from one another; but it may be said that all the rooms are very brilliantly illuminated, though, naturally, there are differences in intensity and in steadiness between the various lamps. Our own opinion, however, is that, except in very large halls, these arc-lamps can never be made suitable for interior illumination when used as direct foci of light. No matter how carefully the light is tempered with semi-opaque globes, it is too intense for the eye when brought into proximity to it, and the blue-violet rays, which are the inevitable concomitants of the high temperature of the carbon-points in the arc-lamps, have a very unpleasant effect. Still, there can be no

question that the arc-lamps are most economical, *quoad* light intensity, and hence it would be very desirable to find some method of using them successfully in rooms. We believe this can only be done by concealing the light itself and reflecting it upon the white surface of a ceiling or some screen acting as a ceiling, from which it would be diffused over the room. Two methods of applying the light in this way are shown here. In one room there are two upright standards with seats arranged round them, the standards themselves being decorated with flowers; these standards have a saucer-shaped top, in which the lamp is placed over a reflector, which casts the light up to the flat surface of the ceiling, where it is broken up and equally diffused over the room. The lamps used here are the Serrin, which are neither so brilliant nor so steady as some of the other arc-lamps; but still the effect is decidedly good, and this method of illumination would be admirably adapted to a large drawing-room. In the next saloon is exhibited a similar method of using the arc-light, which is more successful. In this system the standards are dispensed with, and thus the whole of the floor-space can be utilised for a ball or any other pur-

pose that might be desired. The lamp is perfectly concealed in an opaque case of ornamental design lined on the inside with some strongly reflecting material, and the rays of light are reflected upwards on a horizontal circular screen resembling a sounding-board which depends from the ceiling, and is covered on the underside with white paper. This circular screen supports the lamp, which is hung by chains about 6 ft. below it. In the saloon, where the light is shown, there are three lamps and three screens, and although the real light of the lamps is about as great as that of the other arc-lights, the difference in the effect on the spectator is very marked. The three lamps and screens are not of equal merit, one having more shadow cast upon it than the others; but the probability is that an improvement could be effected in the arrangement of the reflector which throws the light up to the screen, that would obviate any objection on this score. No experiments have yet been made from which the cost of this method of lighting can be determined; but the results are admirable—whereas, with the other large lights, however well they may be tempered with opaline globes, an effect somewhat dazzling is produced. But in this saloon every part is perfectly illuminated with a soft radiance that is most pleasing and restful to the eyes, the blue rays being broken up and losing all their objectionable properties when reflected from the screen, and we are of opinion that this arrangement of the arc-lights is the most successful for interiors in the whole of the exhibition. The inventor is M. Joseph Jaspar, of Liège. It should also be mentioned that the lamps themselves, of which several others are shown in ordinary positions, with globes, in other parts of the exhibition, are as steady as could possibly be desired.

When we turn to the incandescent systems of lighting, we find that vast improvements have been made during the last few months. The principal systems exhibited are those of Swan, Lane-Fox, Edison, and Maxim. These are all admirably adapted for interiors, and are so nearly equal that it is difficult to decide which bears off the palm. The three systems of lighting by incandescence which have been longest in the field, are those of Swan, Edison, and Lane-Fox, but the latest invention, the Maxim lamp—of which we give a sketch—was expected to prove a formidable rival to them. In this lamp the carbon filaments are rather broader and larger in section than in the Swan and Edison, and consequently a stronger current of electricity may be used without fear of destroying the lamp, the result being that a whiter light can be produced than in the other lamps. From some cause or other—whether bad management or not—these lamps were not shown during the earlier portion of the exhibition, and now that the saloon appropriated to them has been lit up, the result certainly disappoints the expectations that had been formed, as the lamps do not show up so well as the others. The light-intensity of a lamp is, however, by no means the only element of its practical value, and until the jury—who are only now commencing their labours—have made sufficiently reliable tests for comparing the light given by any of these lamps with the horsepower expended in its production, it would be premature to express an opinion as to the relative practical value of any one system as compared with another, and another very important point is the length of time that these small lamps will last, as to which we are at present without any reliable information. But as regards the effect produced, we have no hesitation in saying that such an exhibition of electric lighting as that given by Mr. Swan has never been seen before. There is no fault to be found with the light given by the Edison, the Lane-Fox, or the

Maxim lamps; but these inventors seem to have been satisfied with employing various adaptations of gas-chandeliers and brackets as supports for their lamps. Mr. Swan has inaugurated a new departure, and one which we think strictly in accordance with the best principles of architectural design. In the case of gas, any chandelier or bracket must necessarily be of sufficient thickness in all its main branches to allow of the introduction of the pipes conducting the gas; but with electricity wires of the finest gauge form the conductors, and it is an artistic error to inclose these wires in thick tubes resembling gaspipes. In the refreshment room Mr. Swan has arranged three chandeliers, two of 25 lights each, and one of 100 lights. These—which we believe were all manufactured by Mr. Faraday, of Berners-street—are of the highest and most graceful description, and so simple without that there is not one unnecessary curve or ornament introduced. We understand that the small chandeliers are similar to some that were made for Earl Spencer, but the large one is shown here for the first time. The lamps have each a small shade over them of opaline glass, and the effect of the whole is of itself worth a journey to Paris to see. In the Congress-room the illumination is arranged on a plan which particularly appeals to French tastes. In addition to several groups of lamps in the centre of the room, depending festoons are hung all round the walls; but this arrangement, though extremely effective, will hardly suit our more severe tastes so well as the chandeliers. Several other rooms are lit by the Swan lamps very effectively; in one, arranged as a kitchen, three small lamps are hung close to the ceiling, under a reflector, and the room, which is about 26ft. by 20ft., is perfectly illuminated in every corner. In Mr. Swan's private office, which is about 25ft. long, we tested the light of a single lamp on a pedestal, and we found that the smallest print could be easily read at the farthest end of the room. With these small lamps there is practically no limit to the variety of decorative effect that can be produced; for instance, the lamps can be hung close to the ceiling, and arranged as stars—with no fear of blackening the ceiling—and one very strong point is that the scheme of artificial illumination can be arranged so as to be almost equally effective by daylight when the lamps are not burning as at night. We do not lose sight of the fact that the lamps of Mr. Lane-Fox, and of the other incandescent systems, can be equally well applied in this way; but to Mr. Swan is due the great credit of being the first to throw off the trammels necessitated by the old systems of gas-lighting, and to adopt a method of grouping and arrangement exactly suitable to the new light.

THE WATER QUESTION.—XVII.

THE SIZE AND COST OF A RESERVOIR.

IN the upper parts of river-basins, where reservoirs may be made, the opposite hill-sides approach each other towards the bottom, and almost meet in the stream with straight slopes. This is a general characteristic; but a really good site for the formation of a storage reservoir widens out in the bottom, above the site of the embankment, and the only way of ascertaining the quantity of water the site is capable of affording, with any given height of bank, is by a field measurement, either by sections across the valley or by contour lines laid down upon a plan every 1ft. or 5ft. in height; but where the sides of the valley approach each other, as above mentioned, the quantity of water the reservoir will contain may be calculated from the height of the embankment and the area of the water

surface. The top of the bank is constructed at a height of from 4ft. to 6ft. above the top water-level of the reservoir, being usually 4ft. in small reservoirs and 6ft. in large ones. Where the depth of water at the site of the embankment does not exceed about 30ft., the top of the bank may usually be 4ft. above top-water, or the level of the waste-weir. With a depth of from 30ft. to 50ft., the top of the bank may be 5ft. above that level, and where the depth is 60ft. and upwards, the height should be 6ft.; but it somewhat depends upon the direction in which the reservoir lies lengthwise, and to its exposure to gales of wind; but, irrespective of this, a certain height is necessary to meet a flood which may raise the water level above the waste-weir, and as a matter of prudence and safety the waste-weir should be of such length as to prevent the water rising, on the occurrence of the greatest flood, to a height more than about 2ft. above the waste-weir. But beyond that, an allowance must be made for the further height to which the water may be driven by wind, and the greater the depth of water at the embankment the longer will the reservoir be on the same site, and on a long reservoir the water is driven up by the wind to a greater height than on a short one.

Where the two opposite sides of the valley meet in the stream the quantity of water the reservoir will contain will be the area of its surface multiplied by one-third of the depth at the lower end. If this depth be designated D, and the area of the reservoir A, the capacity will be

$$\frac{A \times D}{3}$$

To take a case where the embankment would be 50ft. high, the greatest depth of water being 45ft., and the longitudinal inclination of the valley such that it rises 45ft. in 1,000 yards, and, further, where the side slopes are 5 horizontal to 1 vertical, the width of the reservoir at the embankment would be 450ft., and, its length being 3,000ft., it would

have an area of $\frac{3,000 \times 450}{2} = 675,000$ sq. ft., and the capacity would be $\frac{675,000 \times 45}{3}$

= 10½ million cubic feet; but this would be a small quantity for such a height of bank, and the site would not be a favourable one, although, in some situations, it might be the best that could be procured.

We may estimate approximately what quantity of water a fairly good reservoir site would probably afford by examining sites the capacities of which have been ascertained, and comparing these with the respective heights of the embankments, or, rather, with the greatest depths of water, D, and their areas, A, taking these also at several different heights on the same site. The results of an examination of 75 such cases where the depth D varies from 20ft. to 80ft., both inclusive, are as follows:—In each case the cubic capacity is divided by the area of the water surface giving the average depth; this then is divided by the greatest depth, D, giving the ratio set down opposite each case.

No.	Ratio.	No.	Ratio.	No.	Ratio.	No.	Ratio.
1	912	20	19	39	452	68	74
2	583	21	187	40	445	50	74
3	580	22	185	41	445	60	74
4	572	23	183	42	447	61	74
5	560	24	188	43	445	62	74
6	543	25	188	44	441	63	736
7	537	26	188	45	427	61	736
8	528	27	190	46	422	65	734
9	526	28	183	47	422	66	738
10	525	29	185	48	412	67	736
11	515	30	181	49	412	68	735
12	515	31	183	50	412	69	735
13	511	32	182	51	412	70	7315
14	509	33	181	52	412	71	731
15	504	34	181	53	417	72	731
16	5	35	181	54	407	73	733
17	5	36	181	55	407	74	732
18	496	37	158	56	405	75	7281
19	496	38	155	57	4		

The general average of these 75 cases is about $\frac{1}{9}$ D. The shape of the ground, as it widens out above the site of the embankment, makes the average width of the reservoir in all these cases about twice as much as it would be with the straight slopes assumed to meet in the stream at the bottom of the valley, in which case the width of the reservoir is greatest at the embankment; whereas, in the better sites the greatest width is considerably above the embankment, the width there being nearly the average width of the whole reservoir. In the case adduced the area is $3,000 \times 450 = 1,350,000$ sq. ft., and, the greatest depth being 45ft., the capacity of the reservoir is

$$A \times \frac{1}{9} D = 27 \text{ million cubic feet.}$$

With the same proportions and shape of ground, an embankment 96ft. high, with a depth D = 90ft., would impound 216 million cubic feet, the average depth being $\frac{1}{4} D = 40$ ft., and the area $6,000$ ft. \times 900 ft. = 5,400,000 sq. ft. = 124 acres. In addition to the water area there would be required for wash when the reservoir is full, and for fencing, a strip of land along the margin which would amount to about three acres in the first of these cases and to six acres in the last. A tabulated statement would stand thus, including a reservoir of a size intermediate between these two:—

Reservoir.	Average depth.	Greatest depth.	Area of Water.	Capacity.
	Feet.	Feet.	Acres.	Million c. ft.
A	20	45	31	27
B	30	67½	68½	91½
C	40	90	124	216

To estimate approximately the cost of a reservoir for impounding water by an earthen embankment, the following work would have to be taken into consideration:—

Before depositing any earth, the seat of the embankment, would have to be examined, and the top soil and all boggy earth removed outside and reserved for spreading upon the outer slope.

The depth of the puddle trench could not be exactly ascertained before the work is commenced, but it would probably allow a considerable margin for contingencies if the depth were assumed to be, at the deepest part, equal to the height of the bank and 10ft. at each end.

Inasmuch as the depth to which the puddle trench would have to be excavated would not be known in beginning the work, the sides should be carried down vertically as far as the ground is of uncertain character, and until the ground below can be proved to be strong and suitable for the commencement of the puddling.

In almost every case close-planking the sides of the trench would be necessary. When this is done by driving the planking vertically behind horizontal wallings, the depth to which the trench can be carried down of the full width is limited to the length of the runners used, for at the bottom of each set the new set of timbering must be commenced 6in. or 8in. on each side within it, and when the depth of the trench is great, this continual narrowing does not leave sufficient width in the bottom, unless the width at the top be made greater than is required for the thickness of the puddle. It is, therefore, better in these trenches of uncertain depth to lay the planking horizontally.

In going down with the trench, water may be found to come in through fissures in the sides, on one side, or the bottom. As long as it comes through the bottom, the trench would be carried further down, so as to get

completely under the water, if possible; but if it come through a fissure in the side only, that fissure would have been passed through and may be caulked with cotton-waste or tow, or plugged with dry wood. If the water running into the trench can be stopped in this way, and the bottom is strong and likely to continue so, the clay may be got in and worked for puddle in thin layers all along the trench, doing the puddling more by labour than by water, enough of this only to soak the clay being allowed to run on to it; the bulk of the water being conducted to the sump-hole from which it is to be pumped. The bottom of the trench for this reason should be inclined sufficient to carry off the water quickly. Strong springs of water met with in excavating a puddle trench can only be dealt with by special means; but in nearly every case there will be water naturally soaking out of the adjacent ground when its balanced pressure is relieved, and it is necessary to lay the bottom dry by pumping before the puddling can be commenced. Nothing could be a worse beginning of the work than to throw a mass of puddled clay into a wet bottom; it could not be united with the sides of the trench by treading, as it can be in the absence of water, and it might well be expected that the water in the ground on the upper side of the puddle would, in that case, rise on its outer side between the puddle and the outer side of the trench; whereas, when once the puddle has been well worked of a stiff consistence, water cannot pass it or act upon it; but if, in the first instance, water is in excess, a way is prepared for a future run which would carry with it small portions of the clay continually. If the trench cannot be kept free from water while the puddling is being done, it is necessary to protect it from future contact with water by a facing of concrete and a concrete bed—although, as to the bed, the motion of the water in the bottom carries with it the cement or lime, and leaves little but a mass of loose materials, unless, in the first instance, a drain-pipe be laid under the concrete bed to take the water to the pumping-engine.

GROUND-ICE.

It has often been a wonder how ice could be formed at the bottom of a stream of water, seeing that it is lighter than water. The fact is apparent, but how to account for its formation had been a matter of difficulty. Mr. J. B. Francis, the eminent engineer and hydraulician, has explained this fact in his address, as president to the American Society of Civil Engineers, at Montreal, in June last. The essential conditions of the formation of ice at the bottom of a stream, and its attachment to stones, gravel, and other substances, are that the temperature of the water must be at its freezing-point, and the temperature of the air above it must be below the freezing-point of water; there must be a current in the water, and it must be exposed to the air. Under these circumstances ice is formed on the surface in small needles, which would remain there and form a sheet if the water were still: but if there is a current sufficient to mix the surface-water with that below it, the formation of the sheet of ice is prevented. Water flowing in a channel, whether rough or smooth, does not flow in horizontal layers, but rolls along, the surface-water becoming continually mixed with that below, and the bottom water rising to the surface. Experiments with coloured water in straight channels in earth and masonry showed that the bottom water reached the surface at distances varying from 10 to 30 times the depth of the stream, and in natural watercourses, where the beds are more irregular, the disturbance

would be much greater. The result is that water at the surface of a running stream does not remain there, and when it leaves the surface it carries with it the needles of ice to the bottom. Its adherence there is explained by the phenomenon of regelation, first observed by Faraday. He found that when the wetted surface of two pieces of ice were pressed together they froze together, and that this took place under water even when the temperature was higher than the freezing-point. Professor James D. Forbes found that the same thing occurred by mere contact, without pressure, and that ice would become attached to other substances in a similar manner. At the bottom of a stream, under the conditions named, there can be no abstraction of heat, and therefore pieces of ice may freeze together, or adhere to other substances. When a piece of ice, of considerable size, comes in contact under water with ice or other substance, it would usually touch in an area very small in proportion to its mass, and the forces acting upon it and tending to move it would usually exceed the freezing force, and the regelation would not take place. In the minute needles formed at the surface of the water, the tendency to adhere would be much the same as in larger masses, touching at points only, while the external forces acting upon them would be extremely small in proportion, and regelation would often occur. The adherence of the ice to the bed of the stream is always down-stream from the place where the needles of ice are formed. In large streams it is said to be frequently many miles below. The ice-needles do not all become fixed, but a large part form spongy masses which drift along with the current.

STONEHENGE IN TIMES PAST AND PRESENT.

IT would be difficult perhaps to find a subject—an architectural subject—of more interest and historic import than that of Stonehenge—that monument of a bygone age, on which so much has been said from time to time, and about which so little, if anything, has been certainly determined. Looking at Stonehenge through an old print of it, or at a photograph of it, to say nought of the sight of the ruin itself, is like the looking into the dead Past. It would seem, indeed, to be but a subject to wonder at and to dream about; and we should hardly have ventured, in these practical days at least, to more than glance at it, but for at last a gleam of something like certainty which is, by slow degrees, coming to us about it. It has, too, just been proposed, as all the world is now aware, to *restore*, as the term is, Stonehenge—that is, as we must needs suppose, ultimately to put upright again its fallen monoliths—i.e., those of them which remain, and thus to exhibit to the world at least a *part* of Stonehenge as it originally was. We say a part of it, for we can hardly suppose it possible, even in these days of “restorations,” to *rebuild* this primeval structure, and to thus make it again new, any more than it would be to again utilise it. Our simple object here is to ask attention to it, *as it now is*, and to urge contentment with this.

Attention having thus been called to a monument so exceptional, and altogether beyond what may be termed practical import, it may be of some interest to get together a few facts about it, and to jot down a thought or two of what others, equally puzzled with ourselves, have had to say in drawings and otherwise about it. It not only takes us to the beginnings of “architecture,” but to the very beginnings of history, and to much else that is now remote and out of the way, and beyond the present phase of things; but it does yet more than this: it adds to the meaning and scope of

the very word “architecture,” points to its very origin, and evidences out of what simple elements it may be built up, and how much out of such simple elements of solemn impression may be made on the mind, and thus rivalling the impression made by the great works of sculpture, embodying though they do life and living action. It is most certainly worthy of all preservation, if any thing of antiquity is, and will in the future, *if not now*, read many art and architectural lessons, seldom as things are at present thought of. We have made at times notes of it, and have restored it on *paper*. Turner, it may be remembered in the “*Liber Studiorum*” and elsewhere, has pictured Stonehenge as it was in the *last* generation, and even as it yet is. Surely its owner and the House, if he cares enough about it, ought to preserve it, as belonging to the nation, and as an item in art history.

So many things there are which crop up, strange and unexpected, while looking at such a primitive structure, that it need, perhaps, hardly surprise us that the *geologists* themselves have even their say about it, and they tell us that the very stones, of which its huge monoliths are made, are, in themselves, proofs of what strange convulsions and changes this island of ours has been the theatre. It has been by a process of “*denudation*,” as the term is, that these huge blocks of stone have been laid bare, and so thickly in some places have they lain together, that for miles it has been possible to travel over them as in a road. Round the pre-historic town of Avebury, the ground, of chalk, is strewn with grey “*wethers*,” as they are termed, and immense masses of these huge blocks of stone have been thus set on end by a long-vanished people! These are called also, by the antiquarians, *sarsen*, and “*Druid stones*,” and these very stone-masses of which we are speaking, at Avebury and Stonehenge, have been actually left by the simple process of *denudation*, not far from the very spots whereon they have since been built up into such huge monuments as *Stonehenge*, by their antique builders and architects. We may add here, that the *smaller* stones have been brought from a distance, and are mostly, we are told, of *igneous origin*, and, as Mr. Fergusson tells us, have been “*votive offerings*.” Very much yet remains to be done, and to be gone into and examined on the spot before we can get a good and sufficient idea of this strange monument, and the very first thing needed is a good and correct *plan* of it; for but few, if any, of those who feel interested would be likely to credit the number of them which have been made at different times, and yet less to the infinite number of ways in which they are found to differ. We know of no good and thoroughly reliable and “*measured*” plan of this great monument. We can but go by what there is, and by putting one with another, and comparing them, get at perhaps a tolerably correct idea of what actually now is, and what it *was*. Stonehenge, as we can now imagine it, was a circle of monolithic blocks of stone, some 14ft. in height, and about 105ft. in diameter. They are thirty in number, and are covered or capped with blocks of stone, from one monolith to another, thus forming a circular stone wall; thus to inclose the inner range of trilithons, five in number, which indeed form the inner sanctuary itself. Within this outer wall, and at about seven or eight feet from it, is a *second* circle, or wall of monoliths, but much smaller and shorter, not more than about four feet high; these are thirty in number—not the least puzzling item in the whole structure.

We now come to the very “*temple*” or inner sanctuary itself, to the space surrounding and inclosing the “*altar*” in the centre. It consists of the huge “*trilithons*,” *five* in number, each trilithon consisting of two

huge masses of stone, each of them some 20ft. high—the lesser ones some 16ft. in height. Each pair of these blocks support a third across and resting on the tops of them, thus making up, probably—through simple size and weight of material and mere mass—the most sublime and simple effect of which architecture can boast. It fairly rivals the work of old Egypt, and more cannot be said of it or for it; and it serves to evidence, if it does no more, the fact of how fine and how curiously impressive is the influence on the human mind of a simply and simple reality of *truth*. A mountain rock mass is not more so. There is here, be it observed, no ornament or detail to help. There is nought but dimensions and reality of material, and *absence* of ornament. Within this circle of huge stone blocks are other smaller ones about 7ft. in height; three immediately in front of each trilithon; but for what purpose who shall guess? The altar, we must needs suppose of sacrifice, stands in

Talbert, and have been recently purchased, so the publishers inform us, expressly for this volume. The other designs include a series of domestic interiors, by Mr. Henry Shaw, architect, and a collection of designs for furniture, contributed by W. Scott-Morton, A. Jonquet, W. Simms, J. Ward, C. Porter, Alfred E. Robinson, W. Hamer, J. Breckin, E. Foley, G. Thomson, and other designers. They have been drawn and engraved by the publishers of the *Cabinet Maker and Art Furnisher*. Glancing over the 350 designs, we find the publishers have catered for every variety of taste, from Tabor to Anglo-Japanese and Renaissance. The Talbert sketches, which are headed by a likeness of the late artist himself, contain a few striking characteristics of a style of furniture which has nearly passed away, and, therefore, can hardly be called "fashionable." The "Pet sideboard" purchased by the South Kensington Museum, is certainly one of the

page 55, and for a panelled dining-room, the horizontal lines of the mantel and overmantel governing the panelling of the walls. Another part embraces designs by sundry artists, W. Scott-Morton, A. Jonquet, J. Ward, and others, and includes sketches for hall-seats and chairs, hat-stands, sideboards, and other dining-room requisites; library and drawing-room furniture. Some of these sketches do not add to the value of the work; for instance, the designs on pages 82, 83 the cornices and fringes would have been better omitted, as they give a rather catalogue-look to the book. Plans and details are not given, and we assume that the volume before us is chiefly intended as a pattern-book for the general trade. Some of the designs have been manufactured, and the names of the makers are given. Reference numbers are given under all the sketches, so that in ordering any article, it will be sufficient to quote the page and number.

a. Altar with great trilithon at back of it. b. Outer circle of monoliths. c. Inner circle.

the centre, thus strangely inclosed. In this simple way is Stonehenge "designed" and built up; and in the mind's eye and on paper it is easy to restore it and to see it as it was. But what imaginative power can repeople it and fill it with its antique life?

It would be, perhaps, difficult to add anything to what has been said by the stones themselves to the poetry and romance of Stonehenge. All alike is equally strange, and out of the ways of our every-day and modern life; but it has always struck us that, perhaps, the most remarkable thing about it, and its most striking fact, was the selection of its *site*, in the very midst of a wild, and wide, and open plain, and away, as we must suppose, from ordinary human habitation and dwellings. The finding of its very materials on the spot, and needing only to be utilised, partly, doubtless, explains this, but not wholly; and we cannot but think—and it adds to our earnest wish to preserve all that remains to us of such a monument—that those who planned and built Stonehenge, and other of such primeval structures, must have had it in them to, mentally and inherently, see into the meaning and value of this fitness of the *place* to the object proposed; and, doubtless, to make a sacrifice of much for the sake of it. That there must needs have been difficulties, of which we can form but little idea, would seem to be proved by the existence of the *valium* all round the structure, at the distance of about 300ft. from the outer stone circle. There is much to interest here, and we can but hope for further and *more detailed* inquiry and research, and would trust that the owner of Stonehenge will aid in this, rather than lend a hand to its destruction. Much might come of it, and at but little cost, comparatively. C. B. A.

FASHIONABLE FURNITURE.*

THIS is a book of designs or sketches for furniture under the above title. Nearly half the sketches are by the late Bruce J.

* Fashionable Furniture: a Collection of Three hundred and fifty original Designs of Cabinet-work, Decoration, &c., including Sketches by the late Bruce J. Talbert, architect, and H. Shaw, architect. Published by the Cabinet Maker and Art Furnisher, Finsbury-square.

best productions of the series, and it shows the end of a dining-room with a deep panelled cove and some side panelling. The designs Nos. 4 and 5 are not worthy the artist's reputation, but they are conceived in an Old English spirit, which is not the style he usually excelled in. The jambs and mantels of the chimney-pieces are heavy, and show a bare knowledge of Jacobean mouldings. The treatment No. 6 is better. The examples of sideboards, waggons, and other furniture for the dining-room are interesting, and indicate a certain Gothickesque feeling. We take, for example, No. 10, No. 15, No. 17 as exemplifying this spirit. No. 11 is a broadly and happily-treated specimen of a "Jacobean" sideboard, though the mouldings are essentially Gothic. The designs for chairs evince also the work of an artist whose strongest *forte* was Gothic. The study and library are next illustrated, but the specimens want the breadth of Old English work. The drawing-room decoration on page 25 is quietly arranged, and we notice several sketches for cabinets of pleasing and inexpensive design. Even Mr. Talbert was a little too much addicted to certain vices which are now chiefly limited to manufacturers of stock furniture, such as a redundancy of turned members, balusters, fretwork ornaments, &c., though in most of the sketches there is not much with which the practical cabinet-maker can find fault. Many so-called designs for furniture we have seen are simply impossible, and could not be executed like the drawings of them. Overmantels are numerous, and the sketches contain a few suggestive designs, and bedroom furniture is also well illustrated. The interiors by Mr. Henry Shaw are clever in parts. The designs for hall and staircase have some freshness, and are Renaissance in style; though the scrollwork of the staircase-balustrading is somewhat coarse and heavy for the style. It is a pity a sketch-plan did not accompany this design. The Queen Anne treatment of hall is quiet, but the arrangement somewhat queer. The side of library, page 51, is not so good an Italian design as the Queen Anne sketch for morning-room, page 53. Among other designs we notice a rather pleasing sketch for a bookcase cabinet,

PRACTICAL NOTES ON PLUMBING.— XV.

By P. J. DAVIES, H.M.A.S.P., &c.

TRAPS (continued.)

U-TRAP WITH FLAT DIP (Fig. 88.)

THIS trap being my own invention, I commence by giving my readers the proper instructions for its manufacture.

Make the body, Fig. 88, M D J I, as you would the body of the U-trap, Fig. 79, and then wipe in the inlet-pipe Y. Now measure off from

M to the front of the dip, and with a saw cut the cheek down to the depth you require for the

water-lock; then cut the other side, and finally across the top. Prepare a piece of stout lead K, just wide enough to drop into this cut, and burn

* All rights reserved.

it there, or, with a copper bit, solder a good thick seam all round the cheeks and top; or, should you prefer to wipe it in, let the plate be prepared so that it will stand out $\frac{1}{2}$ an inch all round.

The object for making this style of trap, is to obtain the width across the dip, which allows anything to pass from the inlet side to the body of the trap.

CAST LEAD ROUND-BOTTOM \cap -TRAP, WITH FLAT OUTGO.

Pullen's New and Improved Patent \cap -trap may be had with a round bottom and flat outlet. The object of the rounded bottom is too well known to require any comment here. Suffice it to say that this trap (which is now made according to my scale for the \cap -trap), is not

FIG. 88, B.

only self-cleansing, but proof against waving out. It is very easy to fix, and, in fact, possesses every qualification that is required in and constitutes a good sound trap. Fig. 88 B, shows the elevation.

\cap HUNCH-TRAP.

This trap is made to answer the purpose of the \cap hunch-trap (Fig. 69 A, 98, &c) in positions where the pipe is required to be continued in a straight line. For mode of construction Fig. 88 A. Commence by cutting the cheeks and outlet in one piece, then solder on the back band G D M, next solder the inner band F A I E to form the outlet lip F, after which the small back piece A H; you must then put the top on as in an ordinary \cap -trap. This trap is also well adapted for use in cases where the closet or urinal, &c., is situated in a recess in the wall. See also Fig. 69 A.

\cap -TRAPS.

On page 87 in the copy of this journal bearing date July 15, will be seen an old \cap -trap, manufactured 1678.

The proper method of striking this trap correctly is as follows:—To make a 9in. trap, open the compasses $4\frac{1}{2}$ in., and describe the circle A D C, Fig. 89: draw the top line E H, cutting the circle as shown. Now draw the water-line

I J, which is generally the size of the dip-pipe; that is, assuming the dip-pipe to be 4in., you should keep the water-line down 4in. from the tap, though, if necessary to get a little more dip, you may make it a little higher. Next, with the same radius ($4\frac{1}{2}$ in.) strike the arc D F N, cutting the water-line, and also the outside of the first circle, as shown at D F; then strike the heel line E I square with the top-line, and cutting the circle, also strike the outlet end H N. If you prefer a sharper outline curve, set the compasses at a smaller radius. The trap is made up in the same way as the \cap -trap, excepting that the solder-line round the top does not join.

\cap -TRAP WITH SOLID END.

The object of this style of trap is to save a

bend on the soil-pipe, and is done by making it with a stop or solid end, and taking the soil-pipe right down as at J, Fig. 90. Make the

joint F on the bottom of the band (which should be straight at this point), wipe round the cheek, as shown at F. Be careful not to have any sharp angles, and that the trap is not wider than the outlet, also that the soil-pipe is fixed in a line with the solid end.

THE ADEE TRAP.

This is an American patent, the action being that of the \cap -trap, but made in halves as shown A B, Fig. 91. D is the dip-pipe, S the soil-pipe,

C the cover, E the body. While not wishing to say anything derogatory to this trap, I nevertheless think that it has a fault—namely, the outgo-pipe coming up to the point F. I think if the band were taken up as per dotted line E H, the soil would have a much better chance of getting away. Adee claims as one of the great merits of his trap that it will not siphon out, but this is nothing if an air-pipe is used. However, it will not wave out, which is a great advantage.

THREE-QUARTER OR CUT DOWN \cap -TRAP.

The title of this trap will explain for itself that it is a modification of the \cap -trap, or rather that, owing to inconvenient circumstances in fixing, the \cap -trap has had to be slightly altered to render it suitable for its confined or awkward position. To meet these trying circumstances it is sometimes necessary to cut down in the following manner:—

See Y E, Fig. 92. In instances where you can go down 1in. or more below the outgo, we sometimes do away with the dip, and the trap is doubtlessly useful in many places where the ordinary \cap -trap cannot be used—viz., for illustration sake, under the bottom of a cistern, or as an interceptor in a main drain. In the former case you can take the waste-pipe from cistern horizontally to the outside or from under the bottom of the cistern, and into the trap with a knuckle bend. Then, again, it may be used for a child's closet, where, to avoid a step, it is necessary to keep the basin low. These basins should in such an instance fit into a lead hopper, so that the top of the hopper

will be above the water-line. But, to be brief, there are many instances where this trap is

very useful, of which I will explain further when treating of inside work.

BELLY TRAP.

This, though known as the Belly, is actually the siphon. I have been able to trace back its use for at least 3,400 years, and it is beyond dispute that these siphons, or the system of siphonage, was well known even before that date.

As an instance of its antiquity we have only to quote the words of Pliny. He says:—"Water always ascends of itself at the delivery to the height of the head from whence it gave receipt. If it be fetched a long way, the water will rise many times, but the level of the water is still maintained." Fig. 93 is the belly trap, perhaps in an improved form. B is the inlet, which, please notice, has a drop or cathetus from B to the water-line S. This is most effectual for pushing forward solid substances owing to the law of falling bodies accelerating in proportion to the space travelled—i.e., suppose the depth from B to the water-line S to be equal to the depth of water within the trap, then the momentum gained will be of equal force to press this forward. Students in mechanics will find some exemplification of this law in the first lessons of mechanics by that item known as "the two balls showing reaction."

There is, however, another point to be considered in this trap. Fig. 93 represents a very

long trap-body, which holds more water than a trap made after the model of Fig. 94, so that in reality, assuming that an equal pressure of

water is applied to each trap, there would not be as much water removed by that pressure from Fig. 93 trap as would be from Fig. 94 trap. This is important to a degree from a sanitary point of consideration, as in all traps the whole of the water should be changed, if possible, for the very simple reason that the longer water is exposed to poisonous gases, the more it becomes imbued with the poison, and consequently the more injurious it becomes to the health.

To strike these traps out, first mark the dip part T out to the size required—I think the smaller the better, as at Fig. 94. Next decide upon the size of your trap, say 4in.; then from the same point A stretch the compasses to E, which must be 4in. beyond the throat line T, and strike the half-circle B D E F. Continue D to B straight up to the point required as high as you can for the fall; low to this line draw a right line, also having a fall as from H to B, but keep the intersecting point at B sharp from this line; open the compasses to across the other side

of the trap at V, and strike the backline V K J, and draw the line I I parallel to H B. Next describe the outlet with an easy sweep, as at E X, but with sufficient rise above the throat-line for the water-lock; draw the out-go line C G and the top curve L M, which you can obtain from the point P, or as shown at the intersection point C, Fig. 24.

N.B.—These traps are generally made in two halves, and soldered up the sides.

(To be continued.)

A NEW CARTHUSIAN MONASTERY.

NEW counties have had more of archaeological research bestowed on them than Sussex. Battle Abbey, Pevensey Castle, Lewes Abbey have all been exhaustively dealt with. Arundel, Chichester, its Cathedral, St. Mary's Hospital and Abbey of the Grey Friars, have received most patient investigation, and there is not an historic fact or a stone unturned for the enthusiastic antiquary to "turn up," unless perchance he burrowed beneath the foundations, whence he might unearth some Roman baths, inscribed tablets, stone coins, and votive altars.

I have, therefore, nothing to do with the past. My business is to describe a monastic building of the present, now approaching completion, which will add a page or so to the archives of the county, and probably interest the diligent archaeologists of the future; albeit the history of the present and future will be more exhaustively handed down than the history of the past if the records are not destroyed in a great natural or civil convulsion, in which case the diligent antiquary will have more scope for his deductions. Having visited a similar religious establishment in the Midlands sometime ago, where I received the utmost courtesy from the monks and all the information asked for, I concluded that there would be no difficulty in eliciting all I needed to understand the arrangements of the great building I had made up my mind to explore; but I was disappointed. Hence my narrative will be incomplete; however, I will endeavour to describe what I saw, and relate what I gleaned from the workmen and others. Starting, then, without any preparatory knowledge, except the few topographical hints necessary to find the place, I booked from Worthing to Partridge Green, and took my seat in the train about 11.20. Broadwater Church, with its Norman tower, was first sighted, remembered for its fine Norman chancel arch and its Transition choir-arch, after which, up among the trees, I espied the gable tower of Sompting Saxon Church, one of the very few remaining with any trace of the old work, its shingled roof, diamond-shaped and terminating with a vane, suggesting the spire of a later date, peeping above the foliage like the hood of a grey friar. Then Shoreham, with its fine Norman church (lately restored), where we changed for the main line. Passing Bramber Castle, one of a famous Norman stronghold, built upon the site of an earlier one, of which little remains above the foundations, I soon after observed a white spire on the right, tapering above some trees on rising ground about four miles distant. "What church is that?" I inquired of an agriculturist. "Taint a church; it's a monkery up at Cowfold." The object I have in view, thought I. Alighting at Partridge Green, I found that there were about three miles to be covered, and I set off immediately along the parish road, bordered occasionally with cottagers' gardens all day with the gayest of common flowers; the cottages, built of wood, having here and there a sturdy pear-tree, laden with fruit, reared like a child against the exterior. Turning sharply round to the left at the gatehouse, I soon reached the entrance to the grounds, and the buildings of the monastery, enclosed within high walls, with battlements. I endeavoured to obtain a good view of the exterior, to enable me to form an idea of its architectural features, but in vain. Everything worthy of notice within was shut out by the high walls, and everything worth seeing within was shut out from the fine view of the Sussex downs and villages notwithstanding. The old building, of a fine medieval structure, and of insignificant modern additions, between two, stood apart on a level of about 100 ft. on the left a pair of gates opened into a large yard surrounded with a high wall, and a small cemetery, carpenter's and other workshops, over which are the quarters for the lay or working brothers probably, well lighted from the yard side. This

section of the inclosure, I was told by a workman, is called the "Obediences." The centre on this, the east side, is occupied by the Hospitium, or guest-house, on one side, and the porter's lodge on the other; between which a bold archway leads to the first quadrangle (perhaps four acres), two large basins for fountains resting on either side, corresponding with the wells of the old monasteries; but these are evidently for ornament and not for use, as the standpipes are already fixed for the jets to throw up the streams in graceful forms. Looking at the number of basins for fountains in the grounds, the lavatories and drinking-fountains in the cloisters, and the sanitary arrangements throughout, it is evident that a good supply of water is expected to gravitate from somewhere. Spacious cloisters border three sides of this quadrangle, over which, approached by wide stone staircases, are the first set of corridors and chambers for the monks, and probably the guests' apartments, as I observed another staircase by the guests' house. The west front of the Church, or rather, the front facing east, tills the other side. The style adopted is Romanesque. The west front consists of a centre flanked by wings, from which towers and spires ascend, but the tall spire I had seen in the distance rises from behind the sanctuary at the opposite end. Entering the spacious porch (query, Galilee porch), I found myself in a good-sized and lofty church, fast approaching completion. The ceiling is groined, and the interstices filled with white glazed bricks. Long slabs of marble, waiting the manipulation of Italian workmen, lay about, evidently intended for pilasters to adorn the walls. The organ-gallery is over the space set apart for seculars, and at the other end is the sanctuary, with, as yet, only the foundation for the high altar, above which I observed the usual recess for a figure of the Virgin, with provision for shedding a tinted light upon the features to give them a supernatural appearance. When this church is finished and adorned with the usual embellishments of Romanism, I believe that it will be no mean competitor, for size and richness, with some of the first of its order in the metropolis. On the right of the sanctuary is a spacious vestibule leading to the vestry, in which stands an altar of carved Caen-stone, and on the floor above is the sacristy, both having vaulted and groined ceilings. In these offices I first noticed the excellence of the joiners' work in pitch-pine. High dados, with heavy mouldings and details, line the walls, and huge tables, with sliding shelves underneath for the vestments, occupy the centres of floors. From thence I passed through some bewildering corridors, noticing occasionally a niche for the shrine of some hallowed saint, until I reached another quadrangle surrounded by cloisters, from whence I ascended a wide staircase to a corridor communicating with another set of cells or lofty chambers with deal floors, each being about 15 ft. by 14 ft., and well lighted, overlooking the quadrangle with its central basin and fountain. Each chamber has a stove, to add to the comfort of the inmates, and when furnished, these apartments might be cosy and comfortable to those who can accommodate themselves to rest upon a bed and pillow of straw, if the sample I saw is the class of bed to be laid upon. Sanitary arrangements are provided for each set of cells; but the plumbers' device for flushing the arrangements does not appear to me to be as good as it might be, and if the next winter is as severe as the last, a good many burst pipes may send cooling streams among the brothers, even to their cells, of which there is no need, lavatories and bath-rooms being provided for their comfort. Descending again to the cloisters, I observed another open quadrangle, around which the private chapels of the Fathers are arranged, and entered from corridors running parallel. Each chapel has a curved altar of Caen-stone, every one differing in design, with a carved stone frame above for the reception of a work of art, may be from one of the suppressed French monasteries. Up to this time I had not seen a monk, excepting one dressed in a brown cassock, and carrying a pail—a working brother, I supposed; but he dived into a corridor and was lost before I could get near to him. Crossing to the other side of the church, I entered another large vestibule, which led to the chapter-house and to the library over it. The chapter-house has a stone groined ceiling about 30 ft. high, and measures (slight measurement) 60 ft.

by 30 ft. A large carved Caen-stone altar stands at the end, over which is a provision for the reception of a large picture, with stone frame carved after the same model as the others. Here again I observed the fine quality of the pitch-pine, and excellence of the joiners' work in the wainscoting and benches. The workmen were of different nationalities. I found Italian, French, Irish, and English. I inquired of an Italian workman the name of the architect, but could only learn that he was a Frenchman, and involuntarily answered, "I thought so." Ascending the staircase I reached the Library, which is about the same size as the Chapter-house, and lined entirely with pitch-pine from floor to ceiling. Bookcases climb the walls, bridged midway with a gallery, up to the heavy ceiling. Tie-beams run horizontally about 10 ft. apart, bracketed with heavy spandrels, which appear to dive into the bookcases for support. Longitudinal rafters, about 6 in. apart, have an easy task to support the boarding which covers the interstices. Library-tables of excellent workmanship occupy the centre of floor nearly the entire length, and the whole is well lit by side-windows. A Scriptorium, or reading-room, with stone-groined ceiling, and, as yet, bare walls, adjoins. Descending to the corridors, I saw a monk pacing up and down a little way off, and I approached him politely, hoping to get a guide, or, at least, some information; but he appeared to avoid conversation, being a Frenchman, and knowing very little English, and so I bowed, and left him to his meditations. At home and abroad I have received so much courtesy from monks, that, upon this occasion, I felt a little disappointed at his reticence. However, I determined to work my way through the building, and interpret it by the light of my own understanding, failing a better guide. The Refectories are two large and lofty apartments adjoining, wainscoted with pitch-pine, and with a stone pulpit in each. The smaller dining-room, I concluded, was for the fathers, and the other for the brethren. Wandering on, I entered a large chapel, having a plain stone altar, altogether plainer than anything of the kind in the building. Here I met another monk, habited in a coarse flannel cassock with cowl, and, finding that he was French, I tried to extract a little information in his own language, and, from him I gleaned that there are only nine monks at present in the building; but, after three months, it is hoped that it will be ready for occupation, when thirty-eight fathers, eighty brothers, and a number of serving brothers are expected; whereupon I inferred that there is an "upper ten," a "middle class," and "hewers of wood and drawers of water" within the walls of a monastery. The chapel we were in, I learned, was the servants' chapel, upon which I further concluded that the church was only for the "upper ten" and brethren, whilst the servants attended chapel, a parallel for which might be found outside the gates. I asked him if he was a working brother, or if he did any manner of work. "No," he replied; "we lead a contemplative life." I now thought myself in a fair way to obtain information and guidance; but, unfortunately, at this moment a bell rang for prayers, when he said, "I must go," and, bowing, left the chapel hurriedly. After this, I found my way through some corridors, into a large quadrangle (perhaps six acres), surrounded with broad cloisters, partly glazed with tinted glass, from whence I had a good view of the tower and spire, first seen from the railway, which rose immediately behind the sanctuary; a bell-turret rising from the roof about a dozen yards from the tower. The thirty-six detached houses for the fathers surrounded this inclosure, each one having an oak door communicating with the cloisters only—no back door or back windows. A piece of ground had been inclosed in front of the tower, and in full view of all the dwellings of the fathers, for a burial-ground. A party came along as I was returning to the cloisters, conducted, as I thought, by a guide, a man of the respectable working class apparently; but, upon inquiry, I found that he was not a guide, although he was conducting a party of friends, having been, to use his own words, "over the place several times, and know how to work through the maze better than a stranger." He said that the building had been "five years in hand, and would cost two hundred and fifty thousand pounds." "Bless me!—where does the money come

from?" said a lady of his party. "From Chartreuse, I suppose," he replied. "This is a branch of that monastery, I have been told." "Do they make the liqueur of that name here?" I inquired. "No, they can't grow the herbs about here to make it with, but they have a good stock in the cellar. I believe they act as agents for Chartreuse (the famous Carthusian monastery near Grenoble, France)." Our friend rattled on, and I did not interrupt him, hoping to pick up a few facts. "Yes, sir, and they live very well, too. I know a cellar, not far from this spot, where I stand, in which there are hundreds of bottles of wine, good stuff, sent over from France. They have plenty of beer, too. Why, I have seen two dozen eighteens go in at one time myself. Very good to the workmen: they get plenty, twice a day sometimes." This last remark relieved my mind, for I thought such a stock of beer rather too much for nine monks. "It ain't at all a bad thing, sir, to be a monk, I can assure ye—to live in a fine place like this with plenty of good things to eat and drink, and nothing to do but to read and walk about. Yes, they live on all the good things (except meat), fish, eggs, cream, butter, cheese, fruits, vegetables, and there's many ways of cooking those things to make a variety. Stewed eels, sir, and macaroni cheese are very nice, so meat is not so much missed. Very good to the poor, too; if a poor man comes and asks, they give him a meal, and not a teetotal one neither. Yes, sir, I have been here when there's been such a smell from the refractory, as they call it, as have set my mouth watering." "You have good digestion, my friend." "Well, sir, I can eat almost anything." "You don't require pepsine, then?" "No, sir, I don't agree with them teetotal things—I prefer beer." Having exhausted, as I thought, his store of information, which must be accepted at its value, I bid him good morning, and proceeded to walk round the cloisters for the purpose of estimating the distance; but meeting with a workman whom I found to be Irish, it struck me to test my own sight measurement with his acquired knowledge, if he had any. "I suppose these cloisters measure about half a mile?" "I don't know, surr; but they say two miles altogether intirely." If he had included the corridors he might have been within the mark. These cloisters are also supplied with lavatories and drinking-fountains, and in the quadrangle or pleasure-ground there are three large basins for ornamental water.

The door of one of the houses of the fathers stood invitingly open, and I accepted the silent invitation to enter the broad-entrance-hall paved with brick. Upon the ground-floor I found two good-sized rooms, also paved with brick, probably for stores. Above are the living and sleeping-rooms, of a good size, and lofty, the former having a cosy grate, Abbotsford pattern, and adjoining is the sleeping-room and lavatory. Two such comfortable rooms that some of the brethren of the Charterhouse might envy. In the sleeping-room opposite the window is the cot, under a canopy running parallel with the wall, on one side of which is an inclosed closet communicating with the lavatory, and on the other side a stall of the usual pattern, with carved elbows—I did not look for the misericorde; probably that is left to be carved according to the taste of the future occupant—a comfortable seat, before which there is a writing and reading-desk, with a kneeling-board for contemplation and prayer. Upon the cot a sample bed and pillow rested, with a slit cut in each, either by accident or design; at any rate, it proved that both were stuffed with straw, and no deception. So it appears that the fathers' couches are not any softer than those of the brethren. I recollect, though faintly, having read some time in my youth, of a Russian State prisoner who had been condemned to lie upon spikes; at length, his skin became so pachydermatous, that when liberated, he could not rest upon any other kind of couch, proving the old adage "Use is second nature:" hence a straw bed and pillow might become, with use, a comfortable resting-place. In the recessed window stands a pedestal dressing-table, and on the right a dresser with cupboard underneath.

The windows overlook the "pleasure-ground."—What irony! pleasure-ground with a cemetery in its midst, and an open grave waiting for a tenant, while blank walls shut out one of the most charming views in Sussex—Chancerybury Ring for a centre, and the fine range of

hills, with their dipping valleys on either side, waving above the productive plains stretching away beyond the limits of vision. Why the backs of the fathers' dwellings should be turned upon nature and from thence to "Nature's God," I, less than a neophyte, could not understand. After another look at the cloisters surrounding this, the largest quadrangle, I made my way to the old monastery, the insignificant progenitor, architecturally speaking, of the vast buildings now surrounding it. Workmen were engaged in stripping the cement off the flint and clunch-work, and evidently an effort was being made to elevate the elevations from present ugliness to something like order with the new buildings. The nine monks were in possession; consequently strangers were not admitted, and as I could not obtain any information as to the future of this building, I concluded that it was being prepared for the Abbot.

I had been nearly two hours exploring, and now thought it time to commence the return journey, through cloisters and corridors, passing the stairs, leading to a number of cellars for depositing "the wine that cheers,"—I hope not for purposes less cheering. The quadrangle through which I had passed first was reached, and I was soon after clear of the largest modern abbey, rivaling, if not exceeding, in extent, Furness and Fountains, but not destined to exercise the same influence upon the "country round," although it may dispense hospitality and good works. In these days, kings, princes, and nobles, with their retinues, do not seek the hospitality of a monastery; they somehow prefer a lordly mansion or a good hotel, and although hospitality may be gracefully offered, it is not likely to be accepted by many who can afford to pay for a dinner and a bed elsewhere. The world is undoubtedly indebted to the monks of old for many good works, and amongst them for preserving the choice manuscripts of ancient times, the production of illuminated missals, the fostering of architecture and painting, and last, but not least, in a popular sense, for the grand old buildings, now, alas, in ruins, which impart such a savour to our "waysgoose," and provide never-ending interest to architect and painter. But in these days there are so many diligent workers in the studios of art, in the vast and expanding fields of science outside the monasteries, with museums and caretakers of all that is ancient and refined, that I believe, however rapidly these institutions multiply in this country, and they are multiplying upon the strength of a "revival," they cannot do much service in the cause of science and art; and, therefore, we might leave these excellent and devoted gentlemen to live according to their pleasure, in silent contemplation within their own sacred buildings, without vulgar interruption.

On my way back to the station, I saw a stone-breaker doing his best to reduce a heap of flints to a macadamising size. "How long does it take you to break up such a heap as that, my friend?" "A day." "How much do you get for your day's work?" "Eighteenpence, if I break 'em all; it's hard work to do it." "Any family?" "Wife and four young 'uns." There are many ways of serving God, I thought, and this is one of them—to break flints at eighteenpence a day for the support of a man, his wife, and family, with all the practical devotion and self-denial of a monk. Having plenty of time, I diverged from the road into some fields. A farmer had just begun to cut a field of clover, from whom I learned that the grounds of and surrounding the monastery measure about 242 acres, in addition to which the "authorities" monastic have purchased another farm of about 500 acres nearly adjoining. At this moment the sun shone upon the field of clover, bringing out the full power of the rich purple, which dazzled my eyes, and I glanced onwards for relief to the cornfield above, where I found that the iris had absorbed the purple, which had the effect of mellowing the golden tints of the shocks of wheat, producing perfect harmony, or, as an artist would say, "a lovely bit of colour." Then there were the hills far away on the left, rising boldly in the sunshine, or retiring nervously and modestly into the shade. This, and such as this, is shut out at the monastery.

The train was late, and I sat down by the side of an elderly lady, who appeared impatient of the delay. I tried to divert her thoughts by conversation, introducing the object of my visit, and what I had seen at the Abbey. "Ah!"

she groaned, "we live in very dreadful times. Priestcraft is reviving, and we shall have the Inquisition, the tortures and dungeons—" The train at this moment rolled into the station and put a stop to her catalogue of "horrors," resulting in a very practical answer to her fears. The train had backed a little just as she was getting in, when she drew away alarmed. Addressing the guard, "Any fear—any fear, Mr. Guard?" "Oh, yes, ma'am; lots of fear, but no danger. Jump in!" J. M.

SUSPENSION BRIDGE OVER THE NIAGARA.

THE Niagara railroad suspension-bridge, which has been erected nearly 26 years, had for a long time given rise to doubts as to its safety. The very position of the bridge, about two miles below the celebrated Falls, was sufficient to justify any apprehensions that might have been entertained respecting it. A thorough inspection of the cables and anchorage revealed corrosion of some of the strands of wire near the shoes, and it was deemed necessary to make further investigations. A description of the bridge, and the methods and tests adopted are given in a paper read by Mr. L. L. Buck, member of the American Society of Civil Engineers, and reported in their "Transactions." The foundations of the bridge consist of level strata of rock, chiefly limestone, with a bed of red sandstone, about 40ft. thick, below it. A solid stratum of rock, about 15ft. or more thick, occurs at the anchorage. The bridge is constructed with four cables resting on the tops of two masonry towers at each end, the span between centres of towers being 821ft. At mean temperature the upper cables have a versed sine of 51ft., and the lower cables a versed sine of 64ft. The curves of these cables are in planes inclined, their lowest points being nearer together than the tops. The cables diverge from the tops of the towers to the anchorage. Of the super-structure suspended by these chains it may be described as consisting of two floors, one above the other connected at the sides by posts and truss rods, the latter inclining each way so as to form a trussed tube. These trusses are intended to prevent excessive undulation. In addition, lateral vibration is prevented by means of wire rope guys from the lower floor to rocks on the river banks. The author says "Each cable is composed of 3,610 iron wires (scant No. 9 Birmingham gauge), first laid in seven separate stands or bundles of straight wire made continuous by splicing. They formed a loop at each end which rested in a groove around the outside of a cast-iron U-shaped shoe." From an elevation or profile of the chains given in the paper we are referring to, the chains from the ends of the cables take circular curves of 43ft. and 26ft. radii. There are stone supports under each joint of the chain. At the ends, says the author, "pits were sunk into the rock 25ft. deep, 7ft. by 3ft. in plan; these were enlarged at the bottom to 7ft. square, for the reception of heavy cast-iron anchor-plates. The chains entered the rock vertically, and passed down to the plate, where the lower end of each bottom link passed through a separate hole bored through the plate, and was secured by a pin passed through the heads of the links, and resting in concave seats in the lower edges of the partitions. The plates and chains were then built in solidly with blocks of stone, cut to fit each place, and thoroughly grouted so as to exclude water from the iron." From a description of the top of towers, it seems that there are two grooves, with turned iron rollers, 5in. diameter, and close together, supporting a cast-iron saddle, upon which the cables rest in proper grooves.

The results of the tests of the strands of wires are interesting. These were conducted by Col. W. H. Paine. They show, 1st, that the elongation of the strands under a given load was what the modulus of the wire would give if the section was full; 2nd, that the tensile tests had an ultimate strength of about the same as the new wire was required to possess; the fracture was fine and fibrous, and the reduction good, but the stress was confined chiefly to the "etched" parts. It was interesting, the author says, to note that "even where a wire had its section nearly half-eaten away, its ultimate strength would still be from two-thirds to three-fourths

that of the whole wire, showing that the weaker portion of the metal was attacked first." In the repair of the wires it was discovered that the defective portions were confined to the outer wires; the inner ones were as clean and smooth as when first put in. Near the band which confined the strands into one bundle, the outer wires were etched, and from this point to the shoes, the underside of the outer wires were the worst. The cause of the corrosion is attributed to the elongation and contraction of the wires at the strands, due to loads on the bridge, thereby loosening the wires from the cement, and admitting moisture which worked down to the lowest point. The defective wires were cut out and new pieces were spliced in under a strain equal to that on the other wires. The method of splicing adopted is interesting, and we may quote the author's account of it.

1st. The wire bands were removed from the strands and that portion of each wire, seriously corroded, was cut out. Each of the remaining ends were filed to a scarf, and the side opposite the scarf nicked with a set having transverse grooves across one end.

2nd. A piece of new wire a little longer than the piece removed, having one of its ends scarfed and nicked as above described, was spliced to one of the fixed ends by clamping the scarfs tightly with a small hand vice, and then beginning at the middle of the splice it was served closely each way, to point about 1 in. beyond the splice, with No. 20 annealed iron wire, and fastened there by giving the wrapping wire a couple of "half hitches."

3rd. A straining apparatus consisted of two pieces of iron, each about 3 ft. long, hinged together at one end. The other ends were each provided with a hook and steel button, for the purpose of gripping the wire. About 6 in. from the button ends, a rod, with a thread cut nearly its whole length and a nut fitted to it, was arranged so as to draw the two ends towards each other. The new wire was then drawn as closely as possible by hand, and one end of the strainer secured to the end of the old wire. Then by screwing on the nut the desired strain was applied and the new wire cut to the proper length. It was then released from the strainer, and its end scarfed and nicked. The strainer was again applied, and when strained properly the splice was completed by wrapping as before.

4th. The strain was measured by means of a spring balance. The balance was hitched to one of the sound wires at the middle point of that portion of the wire having no bands. Then pulling on the balance, the wire was deflected from a right line about 1 in.—the deflection of wire and strain indicated by the balance, being carefully noted, to be used as the standard for straining all the wires on that strand. When the strainer had strained the new wire to that extent, that with the same deflection, the balance read the same as before, it was then drawn enough further to make allowance for the slip of the splice.

After having completed the splice, the strainer was removed and the strain tested by the balance. By exercising due care in making the splice in this manner, it has about the same strength as the weakest point of the whole wire.

The greatest number of wires thus renewed at either end of any one cable was sixty-five. As many of these were but slightly affected, it is not probable that any injury would have been done had the defective wires not been replaced.

In all cases where a wire was cut out, it immediately took the form of an arc of a circle with a diameter of about 4 ft. As this was the diameter of the coil previous to its going into the cable, it was evident that the wires had never been injuriously strained.

The commission appointed to examine and report on the bridge were satisfied with the conditions of the cables when the mending of the wires was completed. It was thought also that the form of heads and size of pins of the anchor-chains were not sufficient to withstand a greater strain than would be produced by 40,000 lb. per square inch of transverse section of the link. As it was found the chain would not have so great an ultimate strength as the cable, it was necessary to reinforce the strength of the chain to 50 square inches of area.

Mr. Buck, who was appointed to execute the work of reinforcement, describes the plan adopted: pits were sunk in the rock, from each of which two pairs of chains passed from a single anchor-plate to the surface of rock; these chains were secured by one pin, and, beyond the first joint, each of the four chains was made independent, but had the same curvature to the point of tangency with the line of upper cable, from which two of the chains were carried to the cable; the two others passed on each side of the old upper chains in grooves cut in the masonry. The author next describes the application and measurement of the stress. In the upper cable here was applied to expend them so as to raise the low joints and block them with iron plates to such a height as would produce the proper stress upon the chains when cold. The total sectional area of new chains for each cable is about 50 square inches, and the permanent stress from dead load, is 8,000 lb. per square inch. The writer goes into various technical particulars, into which it would be unnecessary to enter

here, referring to the sinking of the pits, which were 17 ft. deep on the New York side, and 23 ft. on the Canada side, also the cast iron anchor-plates, which were 5 ft. 6 in. square and well ribbed, &c. Details of the superstructure and trussing, and the upper and lower chords are illustrated. It was found the old chords had become useless, and the advisability of reconstructing the superstructure in iron was discussed. Plans for this work were prepared, and eventually Bessemer steel was specified, with a tensile strength of not less than 70,000 lb. per sq. inch, but the "Hay-process"—made steel was decided upon for the chords, Bessemer for the posts and lateral rods, and the other parts to be of iron. The execution of the work is minutely particularised; rivets were driven by pressure, and steel rivets were used to all steel portions. The paper also enters into the mode of making the adjustments, such as the camber, stress on suspenders, truss-rods, &c. These had to be made at a mean temperature. The old truss of bridge had a wind surface equal to 14,000 square feet, and the new one of only 8,000 ft. The figures show a total strength for one of the cables of 3,000 tons, or for the four of 12,000 tons. The total weight of bridge between the towers is 1,050 tons, or 1,400 tons including live load. The greatest stress upon the cables at the towers equals 1,400 by 1.78 = 2,492 tons, and it is estimated their factor of safety is 4.11, an equivalent to a factor of three for the dead load and 8.65 for the live load.

SOUTHWELL MINSTER.

THE fine Collegiate Church of St. Mary the Virgin, Southwell, which is being restored and altered to fit it for use as the bishop-stool of a new episcopal see, was reopened by the Bishops of Lincoln and Lichfield on Wednesday.

The Minster was founded early in the seventh century by Paulinus, first Archbishop of York, by whom were also founded the churches of Lincoln and York. The dimensions of that edifice, of which no traces have been identified, are surmised to have been unpretentious. In the middle of the ninth century it was rebuilt, and some few fragments of that building are incorporated in the existing fabric. The Norman portion of the present church is ascribed to the earlier half of the 12th century, and comprises the nave of eight bays, with its aisles and north porch, the transepts, and the three towers, all of them splendid examples of their style, and all executed in Bolsover-stone. The choir was, according to an entry in the Southwell Registry, in progress during the reign of Edward III. This entry relates to a licence from that king, dated 1338, to the Chapter of Southwell, for the taking and carrying away of stones from a quarry in the forest of Sherwood, for the purposes of the fabric, which had been opposed by the foresters. The foundation of the octagonal chapter-house is attributed to Archbishop Neville, at the close of the 14th century, and its archway at entrance is said to owe something to the taste and liberality of Cardinal Wolsey, while the immense seven-light west window to nave, with the battlement above, is one of the few Perpendicular alterations to the fabric.

A series of measurements taken in the early part of the present century give the dimensions of the minster thus:—Nave, 150 ft. 6 in. in length to inner line of transept, 28 ft. 6 in. wide between columns, and 48 ft. in height; side aisles, 16 ft. wide, including bases of columns; transepts, 122 ft. 9 in. across from north to south, and 28 ft. 6 in. from east to west; choir 114 ft. long, 28 ft. 6 in. wide, and 48 ft. high; western towers 106 ft. high from top of turrets to ground.

Close to the church, on the south-east, was the palace of the Archbishops of York, the ruins of which are still to be seen in the field. Seven of the archbishops are buried within the precincts of the Minster, the last being Archbishop Sandys, who died in 1558. Archbishop Walter de Grey, 1215-55, the builder of the south transept of York Minster, whose tomb in that portion of the cathedral is so well known an example of pure Early English work, was a great benefactor to Southwell, having purchased Hexxacre-park for the use of his successors, and procured the church of Rolleston for the

benefit of the chapter of Southwell. Archbishop Hutton built an archiepiscopal throne on the south side of the choir. Cardinal Wolsey often visited the palace, furnished the library there, and purchased a park contiguous thereto; in 1530, the last year of his life, he returned to Southwell with a retinue of but 160 persons, his possessions having been confiscated.

In the early part of Henry VIII's reign, the charities attached to Southwell Church were dissolved, and soon after the collegiate foundation was abolished, although it retained its dignity of head and mother-church of the town and county of Nottingham, and for a short time shared with Ely, Peterborough, and other monastic houses the dignity of being a cathedral. In the reign of Edward VI. the chapter was dissolved, but it was restored by Mary to the Archbishop and Chapter of York, whose property it remained till about 40 years since, when it came into the possession of the Ecclesiastical Commissioners. During the Civil Wars the church suffered much, and the Parliamentary troops stabled their horses in its precincts. Orders had been issued for its demolition, when Mr. Edward Cludd, of Norwell-park, close by, interceded with Cromwell, and procured a revocation of the mandate. In 1711 the spire on the north-west tower was struck by lightning, and a portion of the church consumed by fire, and at the beginning of the present century the wooden spires were removed from the western towers and the chapter-house, and other alterations made.

The present works of restoration are being carried out from the plans of Mr. Ewan Christian, of Whitehall-place, London, the architect to the Ecclesiastical Commissioners. The low-pitched, almost flat roof which now covers the nave is being replaced by an oaken one, of the high pitch shown by the Norman weathering on the central tower. The north and south aisles will also have new roofs of higher pitch, as will also the north and south transepts. All will be of oak, covered with lead. A new roof has already been added to the curious circular fragment of fifteenth-century restoration between the twin western towers, upon which the ancient spires have been reproduced, after careful study of all the available contemporary drawings; these spires are of wood, covered with lead laid herringbone-wise, and are conspicuous objects at a great distance from the Minster. The chamber over north porch—one of the most interesting surviving examples of a Norman porch—is to be restored and re-roofed in oak. This chamber, probably that of the Sacrist, is entered by a door from the north triforium, and is lighted by a triplet of windows in the gable of porch. Concurrently with the raising of the roofs, the parapets all round the building will be raised. The ornamentation upon the transept gables has been added to, and the apex of each is to be surmounted by the figure of an animal, carved in stone; an ancient figure of a bear, saved from the fire of 1711, is to be utilised upon one, and the other figure has been newly chiselled. On the east side of north transept is a chapel, but little later in its details than the choir, and built into the remains of one contemporary with the nave. This, which has been used as a library and vestry, is to be retained for the former purpose; it will be lowered to the former level of floor, several feet below that of transept, and will be approached by a flight of steps, being separated from the transept by a partition. Over it, approached by stone steps, will be the new library, and above this a roof of oak, covered with lead. The floors throughout the Minster are to be taken up, lowered 18 in., and filled in with cement, and a new pulpit will be added, at a cost of £150. The walls and triforia will also be rendered sound.

The works just described are estimated to cost £25,000, to be defrayed by the Ecclesiastical Commissioners. The Bishop Suffragan of Nottingham has purchased, at his own cost, the remains of the old archbishop's palace, as a residence for the new bishop. The contracts for the Minster restoration are in the hands of two building firms—Mr. Henry Cliphams, of Norwell; and Messrs. Cornish and Gaymer, of North Walsham, Norfolk; and the whole is superintended by Mr. James Wakefield, the clerk of the works, who has his office in an ancient chamber in the inclosure, once used for the administration of justice.

OUR COMMONPLACE COLUMN.

FARIAN CEMENT.

KNOWN formerly as Keating's, is a quick-setting white cement, and produced by mixing calcined and powdered gypsum with a strong solution of borax, then recalcining, grinding, and mixing with a solution of alum. There are two qualities made, the "superfine," and the "coarse." For large surfaces, Farian cement is preferable to Keene's or Martin's, as it works freer, but the arrises made are not so sharp. Farian cement has the advantage that it can be painted or papered within 24 hours. For decorative work it is of much value; several colours can be mixed with it to produce uniform tints. It can be used for floors, and is said not to effloresce. The cement is prepared by Messrs. Francis and Co. It is not safe to paint on Farian for six or nine months, according to one writer, as the salt works through; but it is just to say the manufacture has been recently improved.

PEACH-HOUSE.

A USEFUL sized peach-house, according to one authority, is about 32ft. long internally, 12ft. wide, 13ft. high at the back, and 18in. high in front, the lights being made of a steeper pitch than required for a greenhouse. The back wall would be about 2ft. thick, the front and end 14in., or a total outside width of 15ft. 2in. A bed for creepers is made along the house 12in. from back wall, and a trellis is fixed to the latter. The walk, 3ft. wide, of flags, and a space for mould in front 4ft. 7in. wide. A longitudinal air-flue, about 18in. by 15in., constructed of brick and fire tiles, and pargetted, is made, discharging warmed air throughout its length through the spaces in the hollow wall. The trees are often trained on iron frames or trellis-work. No front lights are required. Mr. R. S. Burn describes peach-houses at Worsley Hall, Lancashire, 39ft. by 14ft., of similar construction to a vinery. They are glazed with patent polished sheet glass, 21oz. to the foot, in lengths of 3ft. by 7 or 8in. wide. A brick gutter, lined with cement, in which are two rows of 4in. hot-water pipes, runs along the front wall, and along the middle of the earthen bed are two rows of 6in. hot-water pipes. The lights are generally hinged to the ridge for top ventilation, the lower lights being hung from the gutter-plate, and made to open outwards. About 4ft. forms a good height for front wall of lean-to. We refer the reader to details in R. S. Burn's "Conservatories," Fawke's "Hort. Buildings."

PEDE WINDOW.

A NAME for certain windows at the west-end of a church, especially of the north-aisle, and given to express symbolically the position of the Saviour's feet. West windows of this description occur at All Saints', Tinwell, Rutland, where is one of three lights; at St. Andrew's and St. Mary's, Fletching, Sussex, a lancet surmounted by a square-headed window of three ogee trefoiled lights. In Early Pointed work these lancets are sometimes trefoiled, in later work the spherical triangle is used. In Sussex, in the Early Pointed churches, a rude hole has been punched through the wall. ("Arch. Diet.")

PENALTY.

"THE courts will enforce as far as possible the assessment of damages, which the parties have assented to, but they will not allow one party to impose a penalty on the other." Jenkins and Raymond's "Building Contracts."

THE PERPENDICULAR STYLE

PREVAILED from about the end of the 14th century to the middle of the 16th century, and was contemporary with the Flamboyant style in France. This style is called the Third Pointed or "Rectilinear" style in Sharpe's nomenclature. The west end of Winchester Cathedral shows the change made from curvilinear to rectilinear forms, and William of Wykeham's magnificent nave may be considered one of the grandest specimens of the style. The general characteristics of the style are thus summed up in the "Encyclopædia Britannica." "The fondness for straight in place of flowing lines was more and more developed. Doorways and arches were inclosed within well-defined square outlines, walls were divided by panelling into rectangular divisions, vertical lines were emphasised by the addition of pinnacles and

battresses, used more for ornament than strength, whilst horizontal lines were multiplied in stringcourses, parapets, and transoms to windows. Groined roofs, which, in the 14th century, had been enriched by the multiplication of surface-ribs were now most elaborately enriched by cross-ribs subdividing the simple spaces naturally produced by the intersection of necessary ribs into small panels; these again were filled with tracery, and finally the keystones were formed into pendants, and the branching ribs, radiated as to produce the really beautiful and very English variety of groining called fan-tracery. The amount of skill shown in the construction of these vaults was very great, and most of them have proved their authors' science by the perfect way in which they have endured to the present time. Few things can be seen more beautiful than the steeple of Gloucester cathedral, or of St. Mary's, Taunton." The open-timber roofs, as, for instance, those of St. Peter Mancroft, Norwich; Sall and Cawston, Norfolk; St. Margaret's, Ipswich, St. Edmund's, Southwold; St. James's and St. Mary's, Bury St. Edmunds, and Laverham, are superb. The Perpendicular style finds no exact parallel in Scotland, although the style exists there. Melrose exhibits Flamboyant curves, and also Perpendicular features. The east-ends of Lullithgow and Stirling churches are examples. None of the specimens exhibit the 4-centred arch. (See Billing's "Baronial Antiquities.") On the Continent, the Flamboyant features characterised this period, as we find in Flemish examples. In Germany, this period led to a "spiky and prismatic" character and interpenetration of mouldings is common. For details of this style the reader is referred to Rickman, Freeman's "Hist. of Arch.," Parker's "Glossary," Sedding's lecture recently published. The east and south-west of England are both rich in Perpendicular architecture. The finest Perpendicular towers are found in the West of England: Gloucestershire, Wiltshire, Dorsetshire, and they reach their culminating point in Somersetshire. It has been noticed that Yorkshire has a preponderance of Flamboyant work compared with the south. Willis thinks Gloucester to have been the school of the style, as it was there shown of an earlier date (1338) than elsewhere.

PERSIAN ARCHITECTURE.

FOR information on this subject we refer the reader to Fergusson's "Handbook"; "Encyc. Brit.," 9th edition, p. 400; Layard's "Discoveries"; Owen Jones's "Grammar of Ornament"; Vaux's "Ancient History—Persia from Monuments." Except the ornamentation, many examples of which from MSS. are in the British Museum, there is little of importance to the architect; the Persians were not temple-builders, and their buildings are chiefly palaces crowded with domes richly decorated, and bazars of considerable extent. Their textile designs are rich, and afford the artist excellent models, and their carpets, shawls, and chintzes, and carved work are very suggestive.

PERSPECTIVE.

THE numerous treatises and handbooks on this subject make it unnecessary to describe the operations of an art which every student and architect is required to know. We shall here merely refer to the best works on the subject. For elementary knowledge of the subject, the student may study the lessons in perspective given in Cassell's "Technical Educator," and published separately, or Burchett's "Linear Perspective for Schools of Art." It is exhaustively treated also in the "Encyc. Brit." For architectural purposes, Dr. Brook Taylor's "Principles," published 1763, and Malton's "Treatise on the Theory and Practice on the Principles of Dr. Brook Taylor"; besides an excellent practical treatise by Nicholson, now out of print; and another by Brown, formerly professor of architecture, may be consulted. Moore's "Principles and Practice," and Gwilt's "Encyc. of Architecture," are more recent works. There is also a comprehensive treatise on the practice of perspective in Newland's "Carpenter and Joiner's Assistant." See BUILDING NEWS, 1863, p. 764, for a description of a scheme for working on the board with proportions after the extreme radiating lines have been drawn; Turrell's perspective, described in Society of Arts' Journal, XXXII.; and for the use of the centreline, see "Intercommunication"

columns. There is also a means of obtaining a perspective representation by computation (G. Bernard, 1839); but these methods are not generally followed.

PETERHEAD GRANITE.

THIS material is quarried about 30 miles from Aberdeen, and is very durable. Peterhead granite is red in colour, and is of close texture. The pillars of the Carlton clubhouse are of this granite. The Stirling-hill stones are considered very fine. Of the blue or gray sorts, that at Cairngall is the best. For information on the Scotch granites, with remarks upon them, see "Notes on Building Construction," Vol. 3.

PETERSBURG TIMBER.

THE deals vary from 7in. to 11in. The red wood of Petersburg is nearly equal to Memel, but not so hard. The white deals are not to be depended on and do not equal the Christiania deals; they are apt to expand and contract, even after seasoning, by change of weather. The best yellow deals are shipped from this and other ports, and are free from knots. A good brand is "P. B." (Peter Beliaeff) for best, and "P.B.2" for second quality. The well-known Gromoff deals are marked "C. & Co.," the initials of the shippers, Clarke and Co.—"Arch. Dict."

PIER CYLINDERS.

THE modes of sinking cylinders for bridge-piers are described in a recent article, p. 196, Vol. XLI., 1881. The "air-lock bell" and the "air-cylinder" have been largely used for this purpose. Both are open at the bottom, the working-chamber being filled with compressed air of force sufficient to hold back the water. They are also both accessible from the top, or surface, of water, and are protected by an air-lock. The chamber, however, may be a permanent structure, as after a solid foundation is secured the cylinder is filled with concrete, the air-lock being removed, and the cylinder becomes an iron column. They are generally weighted down, and the best plan of sinking them steadily is to place the weight round the inside of cylinder, low down, in the form of brickwork or concrete. Sometimes the pier is carried up in sections of brickwork, course by course, on a caisson. For practical information we refer the readers to articles in the BUILDING NEWS; Matheson's "Aid Book," p. 499.

CHIPS.

The Cardiff board of guardians on Saturday adopted plans by Messrs. James, Seward, and Thomas, of that town, for the erection of a relief office and pay-room to accommodate 200 persons, at an estimated cost of £350.

Westburne Free Church, at Kelvin-side, Glasgow, which has been built at a cost of £9,000, was opened for worship on Sunday week.

Two new beard-schools at Brighton, situate in Finsbury-road and Preston-road, were opened on Monday.

The Wesleyan chapel at Apsley Guise was reopened on Sunday week, after extensive alterations, including the erection of new roof. Mr. W. Pooles, of Woburn-sands, was the contractor.

St. Martin's Church, Colchester, is about to be restored, from plans prepared by Mr. E. J. Dampier, architect, of that town.

A new organ, built by Messrs. Conacher and Co., of Huddersfield, was opened in the Baptist chapel, Mytholmroyd, near Halifax, last week. The cost was £350.

The Llandudno Improvement Commissioners, at their last meeting, received a report that the new waterworks at Llyndulyn were all but completed.

A two-light window in Trefnant Church, near Denbigh, has just been filled with stained glass. Messrs. Clayton and Bell, of London, were the artists, and the subject is the Three Holy Women at the Empty Sepulchre.

Dr. J. E. Taylor, of the Ipswich Museum, writes that in the course of the excavations for the main sewer, now in progress across the Cornhill, in the centre of Ipswich, a few interesting relics, chiefly Roman and Saxon, as well as the trunk of a tree, have been found.

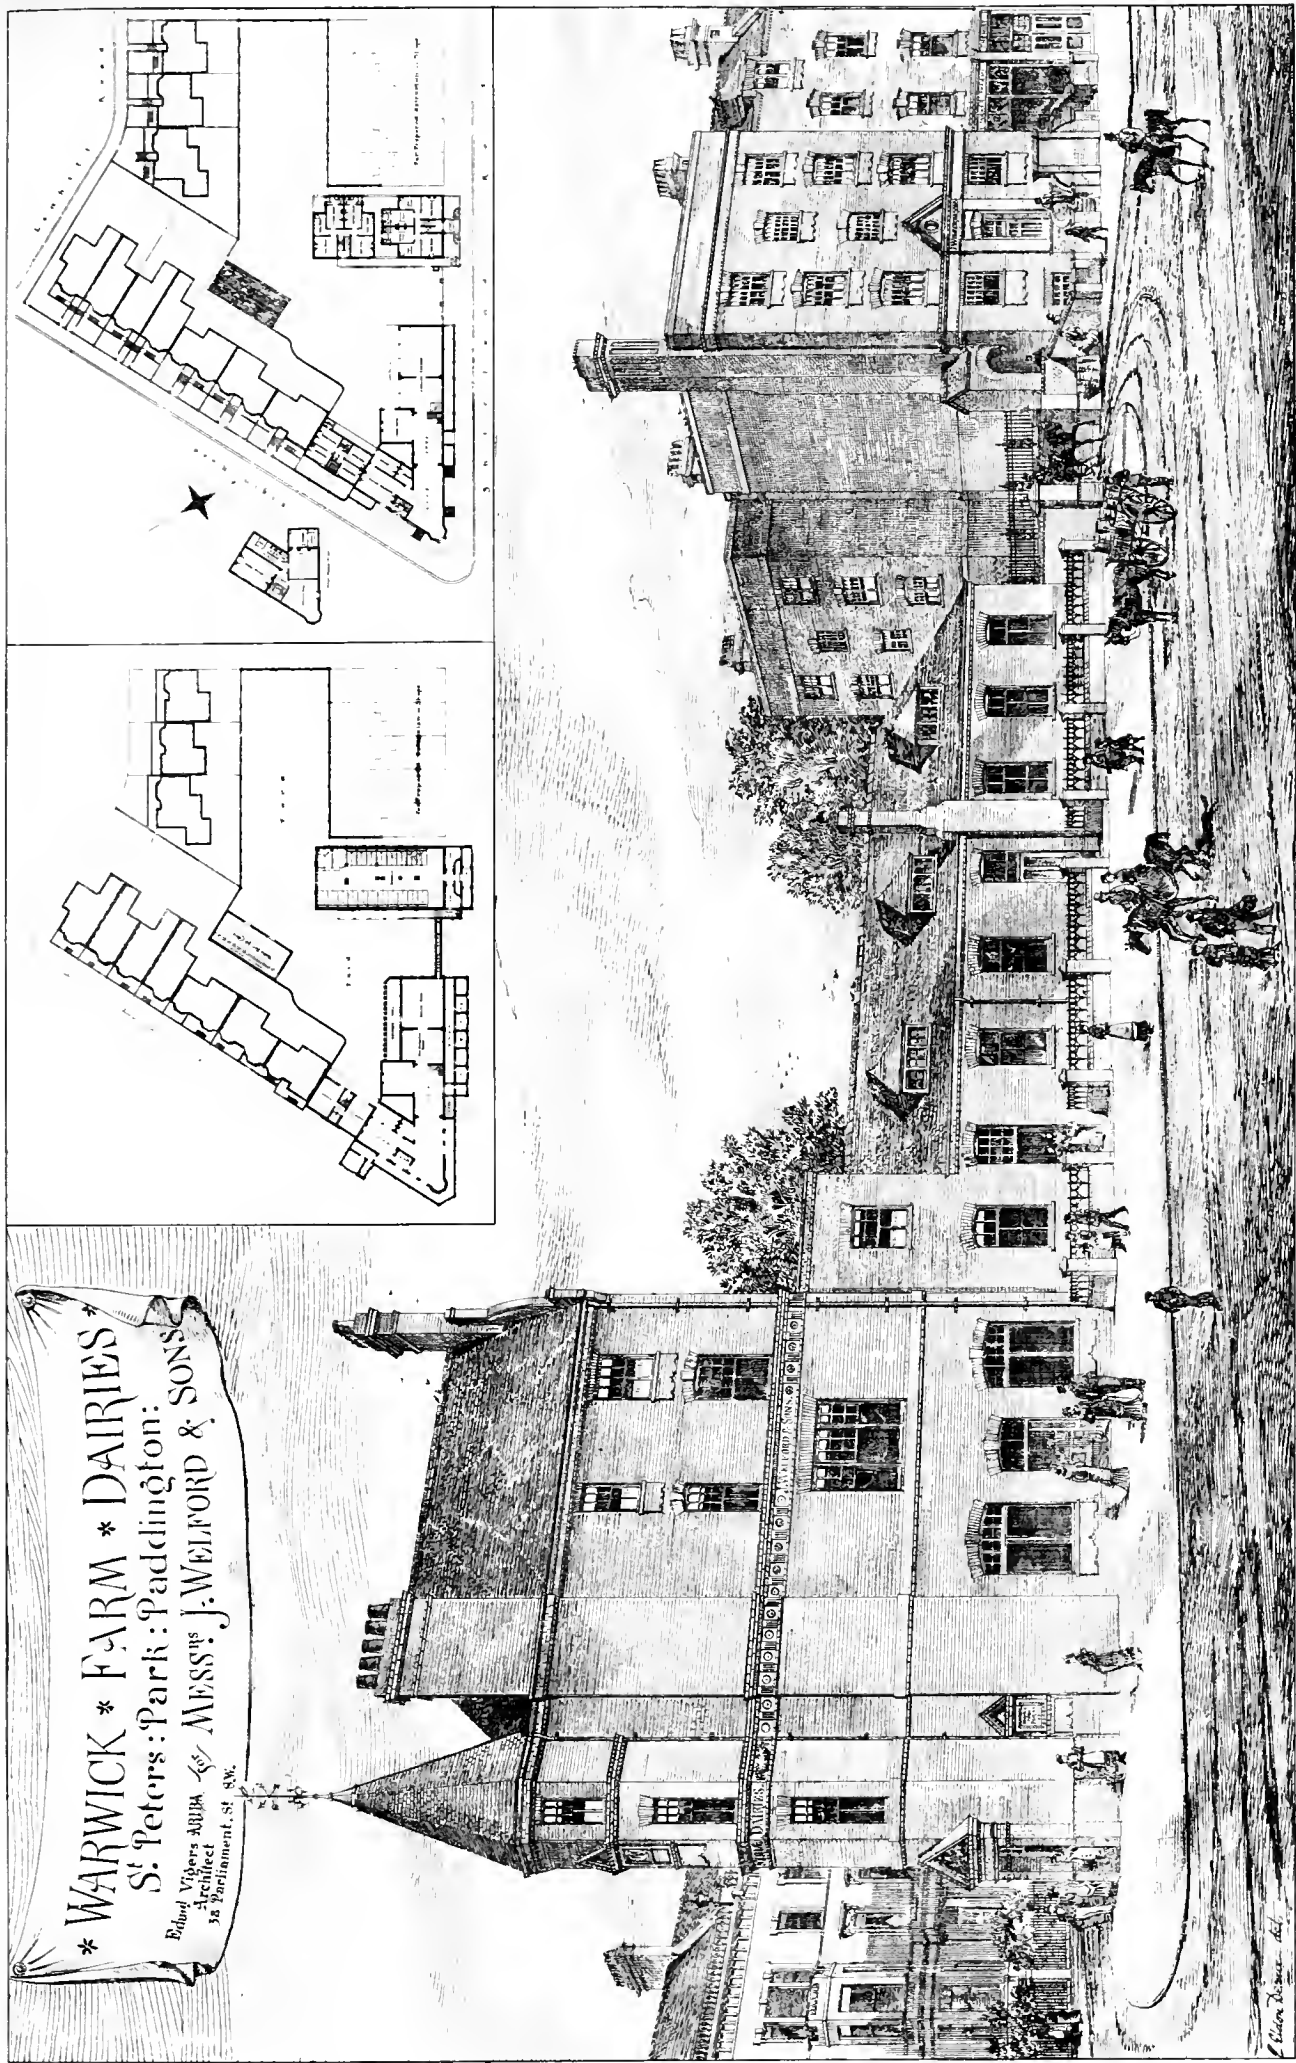

The foundations are being laid at Brasenose College, Oxford, of a new quadrangle, which will comprise about 40 sets of rooms. The architect is Mr. T. Graham Jackson, M.A., of London.

ECCLESIASTICAL ART EXHIBITION, NEWCASTLE-ON-TYNE.

CONCURRENTLY with the Church Congress at Newcastle-on-Tyne there will be opened an Exhibition of Ecclesiastical Art. Most of the leading church-furnishers are represented, and there is in addition a Loan collection, embracing upwards of 400 exhibits, to which many local antiquaries and others have contributed. This department of the exhibition consists of examples of ancient embroidery, including a 15th-century altar frontal, the property of Lieut.-Col. Hill, Llandaff; a cope and portion of a chasuble, lent by Mrs. Bayman, of the Royal School of Art Needlework, and two sets of vestments, in the Cinquecento style, Italian work, contributed by Mr. Scarlett Thomson. Church plate is represented by a collection of ancient chalices and patens, the property of Mr. Hodgson Fowler, F.S.A., of Durham; a chalice made at York in 1599, and a chalice and paten formerly belonging to Hagley Church, Worcestershire, which formed part of the Demidoff collection, recently dispersed. The Rev. A. W. Headlam, Vicar of St. Oswald's, Durham, contributes three offertory basins or dishes, and a jewelled processional cross. Mr. Robinson, F.S.A., of Houghton-le-Spring, sends a remarkable reliquary, found appended to the neck of a skeleton in the old churchyard of St. Dunstons, Fleet-street. Among the modern examples of the silversmith's art may be mentioned a jewelled chalice, designed by Mr. Butterfield for the Rev. R. M. Benson, of Cowley.

Pictorial art is represented by various photographs and chromo-lithographs of ancient pictures, illuminations, drawings of churches and ecclesiastical furniture, engravings of chalices, and a large collection of rubbings of monumental brasses and incised slabs, embracing the oldest known specimen, representing Sir John D'Abernon (A.D. 1277), down to that erected to the memory of Robert Stephenson in Westminster Abbey. Bishop Mitchenson contributes a large collection of photographs of the ancient ecclesiastical buildings of the United Kingdom.

Perhaps no one single subject is so thoroughly illustrated as that embraced by Mr. Bragge's collection of Russo-Greek "Icons," or religious pictures, which are so frequently met with in Russia. These are fully explained in the catalogue.

THE SECRET OF FREEMASONRY.

"**T**HE secret of Freemasonry," says the *Saturday Review*, "is a secret de Polichinelle, and is to be read in fifty different treatises, any one of which will enable a reader to make his way into a lodge quite as well as though he had submitted to the inane ceremonies of probation and initiation. If this is not the case, the Society should authoritatively deny its truth, or it will continue to be under the imputation of having for a great number of years made a great fuss about nothing at all. But in the matter of the antiquity of the order, no disclaimer which they could make would be of any avail. The stories of Hiram Abiff, and of the mysterious pillars Jachin and Boaz which stood at the Temple entrance, as told by Masonic ritual, bear the unmistakable 'Brummagem' brand, and will not for a moment bear the test of criticism, either from an archaeological or Oriental point of view. The real origin of the order as we have it now appears to date from about the beginning of the eighteenth century, while an extinct organisation which furnished the motive for Freemasonry, though having no immediate connection with it, is some three or four centuries older. It has been indisputably proved that the institution of Freemasons took its rise in the guild of operative masons which, under the name of the 'Fraternity of Masons,' was formed by the architect and workmen employed from the 13th to the 14th century in the building of Strasburg Cathedral. The flower and pick of the profession were engaged upon this masterly edifice, and they were naturally desirous of perpetuating the secret of such good work, just as the *Comédie Française* preserve the traditions of the art of perfect acting. Their example was followed by other groups of masons throughout Germany, and all these different lodges were, some twenty years after the completion of the tower of Strasburg,

merged into one association. Their Act of Uniformity was drawn up in 1459, and ratified by the Emperor Maximilian thirty years later by an Imperial diploma. They adopted the instruments of the craft—the square, level, and compasses—as their emblems, and had a secret password, 'Liberty,' which in itself gives a clue to the ulterior aims of the Society. The Fraternity of Masons lasted until 1707, when it was authoritatively abolished by the Imperial Diet.

These are the simple facts about the origin of the Society, or rather of the Society whose constitution served as a model for the more recent and spurious association which has taken its name. It is not necessary to enter into the question of the so-called higher degrees in Masonry, such as the Knights Templars, Rosicrucians, and the like. Their rituals are even more impudent pretences than those of the craft itself, and exhibit a mixture of arrant nonsense, child's-play, and profanity which is rather shocking than ridiculous. Amongst the edifying ceremonies which accompany the initiation of the 'Knights' are parodies of the Holy Sacrament and other solemn services of the Church. Craft Masonry is at least free from the charge of blasphemy, however much it sins in the way of foolish and unwarranted assumption. Some visionary schemes for the formation of a Universal Brotherhood of Mankind, which should emancipate the world from the tyranny of priestcraft and despotism, was no doubt the idea which actuated the founders of the Masonic order, and which made the organisation of the then existing guild of operative masons a ready instrument to their hands. The possible political importance, too, of such an institution as offering a ready vehicle for international conspiracies had much to do with the original success of the movement. But the more widely spread the order has become, the more harmless have been its aims, and the denunciations of popes and kings have only had the effect of giving to a number of benevolent gentlemen the fearful joy of half-persuading themselves that they are conspirators of a very formidable kind. As a matter of fact, Freemasonry is an excellent Friendly Society, established for charitable and convivial purposes, and possesses a widely-extended and excellent organisation, while its so-called ritual, if spurious, is at any rate irreproachable on the score of morality. If the members of the Craft choose to meet together in groups from time to time for the performance of a solemn farce, or delight to deck themselves out in fantastic gear, we have no more right to find fault with them than we have to grudge the Foresters their processions, scarves, bandit-hats, and other paraphernalia at a Crystal Palace fête. The two orders are exactly on a par, with the exception that the Masonic one is the older of the two. It would be more dignified, no doubt, to give up the nonsense, and rely upon the intrinsic merits and real objects of the order; but mystery, even when it is such an open secret as Masonry, has its attractions, and probably does conduce towards holding the Society together. When, however, Freemasons lay claim to an antiquity and an Oriental origin which are absolutely delusive, and when they deliberately seek to impose the sham upon the credulity of the public, it becomes a duty to expose the real nature of their pretensions. Masonry is, as we have said, a very excellent Friendly Society, and very widely spread over Europe, and, indeed, wherever Europeans have settled; but it is essentially a European institution, has no claim to a remote antiquity, and has not the slightest immediate connection with the East or the slightest pretensions to antiquity.

PAINTING OF CEMENT AND PLASTER.

MUCH difference of opinion prevails respecting the question of painting Portland cement, and we have seen work painted a few weeks after the cement has set, which has stood well. There is one point which has a great deal to do with the question of successful painting, namely, the absorbency and dryness of the brick-work itself. Many new walls, saturated with moisture, are cemented, and in this condition no paint can possibly stand if laid on too soon. It is a good and safe rule to enforce that Portland-cement work should not be painted within a year of its completion, to allow it to dry

thoroughly; but we are safe in saying the majority of new fronts are painted before they have been finished three months. A very desirable precaution seems to be to coat the work with linseed-oil first, a recommendation which has been before made in these pages (see *BUILDING NEWS* for 1874, 509, also Vol. XXIX., 494). The painting of plaster-work requires the same care, and the lime works out in small bubbles, destroying the paint. In painting plaster, white-lead and linseed-oil, with a little dryer, is recommended by one authority. This coat should be of the consistence of thin cream, so that the oil is absorbed into the plaster in a few hours. In a day or two another thicker coat may be applied, and a third a few days after rather thicker, followed by the finishing coat. Four coats are not too much for good work. By the absorption of the oil into the plaster the surface becomes hardened, and may be washed. Another method to facilitate this absorption is followed by painters, which is to give the plaster two or three coats of boiling linseed-oil, and then to apply the other coats of paint. We are inclined to think the application of the oil before the paint a better plan, to insure a thorough saturation of the material. The colour of Portland cement and the uneven tints it sometimes assumes is the main reason why painting it is resorted to. For this reason we think it may be worth the attention of manufacturers to turn their consideration to the subject, and those using cement as a stucco might also prevent a blotchy and uneven tint by attending to the preparation of the wall and the sand they use with the cement.

ANCIENT WOOD AND IRONWORK IN CAMBRIDGE.*

ACCURATE and large-scale drawings of ancient iron or woodwork, taken from examples collected in an historic town like Cambridge, which is especially noted for its rich resources of Old English works of art, must always be of interest. It is, therefore, with pleasure that we turn to another part of Mr. W. B. Redfarn's sketches now before us. It includes an old carved oak settle, of which the author is the fortunate possessor. As a simple and hold example of Jacobean work, both rich and free from coarseness, it is well worthy of illustration. The admirable way in which the arms are treated, with their lion-headed terminations, is to be noted as a suggestive feature. The next page shows some woodwork at Christ's College, from the second set of rooms on the first-floor, and dated, in the description, written by Messrs. D. J. Stuart and John Willis Clark, of Trinity College, as 1616, and as being the work of Sir John Finch. Inigo Jones is said to have planned Christ College in 1638, the foundation-stone being laid two years later, and the buildings were partly opened for occupation in 1642. The third, or concluding sheet of the part, illustrates the library-door from St. John's College—a remarkably fine specimen of woodwork in a building notably rich for its series of several periods and styles of woodwork.

PROPOSED CATHEDRAL AT BUENOS AYRES.

WE have been invited to set of designs prepared by Mr. J. Pitt Bayly, architect, of Fulham-place, Paddington, for the proposed cathedral to be built at Buenos Ayres. As the design is to be submitted in competition, we can only here simply describe its main features without committing ourselves to the expression of any opinion. The instructions to competitors left them free to a great extent, and Mr. Bayly has adopted a plan which appears to fairly represent the requirements. The cathedral designed, and of which we have seen the general drawings in ink, has a plan comprising nave and aisles, a transept, apsidal-ended choir (semi-decagonal), three chapels and two western towers, one being a baptistery. The transepts slightly project, and the aisle is continued round the chancel as an ambulatory. On the north side communicating by a corridor with the transept is the chapter-house, an oblong compartment, and adjoining the choir on the same side are two

* Ancient Iron and Woodwork in Cambridge, by W. B. Redfarn. Published by W. P. Spalding, Sidney street, Cambridge.

sacristies divided by an entrance. The dimensions adopted show a nave 160ft. long by 38ft. in clear of the piers, a chancel 56ft. long by the same width, the aisles and ambulating round the chancel being 16ft. wide. The author has adopted a thoroughly French treatment in the planning. The bays of the side-aisles between the buttresses have been arranged for confessionals and open into the aisle by a trefoil arcade of three arches, and flying buttresses are shown supporting the nave-vault. There is a *dicke* at the crossing of considerable height, which is intended also as a ventilator and for the sanctus bell. The longitudinal section shows an arcade of five bays to the nave, over which is a low triforium of small arches and a lofty clerestory, pierced with windows of Geometrical character. There is a groined vault of brick. Externally the west end has two towers surmounted by lofty spires, relieved by pinnacles at the base, and by bands of tracery. Between these is the western entrance, and the end of nave is marked by an arched recess, with a large rose window, with blind arcading above the gable of entrance. The estimated cost is within the sum mentioned by the Government authorities, namely, £58,000. The drawings were to have been sent in on the 27th.

THE LATE MAJOR MANT, R.E., ARCHITECT.

WE have to record the sudden death of Major Mant, R.E., F.R.I.B.A., by his own hand, on Saturday, the 17th inst., at his lodgings, Tavistock chambers, Covent-garden, at the early age of 42.

The deceased was Architectural Executive Engineer for the Bombay Presidency, and also held the post of Consulting Architect to the native States of Baroda, Kolhapur, and Durbhanga. At an early period of his career he showed a decided taste for architecture, and made a special study of the Hindu Saracenic style, in which he was highly proficient. Amongst his numerous executed designs made in India may be mentioned—Bhowanagar Court House and High School, Kolhapur High School, and the Kolhapur Memorial at Florence; Mayo Memorial College, Ajmer (nearly built); Northbrook Hall, Dacca; and Colvin's monument, Agra. Several medical schools have been erected from his designs in various parts of Bengal, and his works include Kolhapur Hospital, Baroda Hospital, and Baroda Library, all in progress of erection. One of the deceased architect's most important buildings is the new Palace for the Guicowar of Baroda, which is now building, at a cost of about £200,000. He was also the architect of the new Palace for the Rajah of Kolhapur, which is at the present time in progress, costing about £65,000. Besides these important commissions Major Mant, at the time of his death, was building a new Palace for the Maharajah of Durbhanga, at a cost of not less than £150,000.

The deceased only arrived home on furlough at the beginning of the year, and was admitted to the Royal Institute of British Architects as a Fellow at the last sessional meeting of that society.

At the inquest the evidence tended to show that the failure of his plans for India led to the sad act; but we have the authority of his principal assistant, Mr. Fotheringham, for stating that this was incorrect, and that it was solely due to private monetary difficulties.

We shall shortly illustrate the new Palace at Baroda, now building, from Major Mant's designs, the deceased having supplied us with drawings for publication shortly before his death.

A series of tramways, authorised last session, are about to be constructed along the Albert Embankment, High-street, Vauxhall, and Church-street, Lambeth. The engineer, Mr. Cameron, proposes, having obtained last week the consent of the Lambeth Vestry, to lay a continuous iron sleeper, upon the top of which a steel rail will be keyed, with tie-bars every 8ft. under the parallel sleepers, clipping the bottom flange.

The Metropolitan Board of Works have decided not to bring forward any Bill for further street improvements in the coming session of Parliament.

New schools are being built at Trichuris for the Mather School Board. Mr. J. Lewis is the contractor, and Mr. Harpur the architect.

Building Intelligence.

BISKE.—On Tuesday week the reopening of Bistre parish-church took place. The amount required for the restoration was £700, and the greater part of this sum having been raised, designs were called for, those of Mr. Spaul, of Oswestry, being eventually accepted. The work, which was placed in the hands of Mr. J. Williams, builder, of Buckley, was commenced in May last. The gallery at the west end has been removed, as well as the whole of the interior fittings of the church. The apse at the east end has been raised and ceiled with wood, and the east window, which previously was level with the Communion-table, has been raised and fitted with stained glass by Messrs. Ballantyne, of London, the subject being our Lord in the Garden of Gethsemane. The body of the church has been filled with two blocks of open seats, capable of accommodating 400 worshippers; while the aisles have been laid with tiles, and the choir and sacristy with encaustic tiles from the Pen-y-boon works of Mr. J. C. Edwards.

BRISTOL.—The foundation-stone of the new church of St. Saviour, Woodcote-park, was laid on Thursday week. The style is Early Pointed, the exterior walls being of Pennant stone, with Bath stone dressings. At the west end, and springing from the gable, will be a bell turret rising some 80ft. from the ground, with a canopied niche at the apex containing a figure of our Lord as the "Good Shepherd." The interior will consist of nave, north and south aisles, chancel, organ-chamber, elergy and choir vestries on the north side, and on the south side a transept. From wall to wall the width of the nave will be 54ft., and the length from the chancel to the western extremity 93ft., while from the floor to the apex of the roof will be 58ft. The chancel is to be 38ft. long by 25ft. wide and 52ft. high. A contract has been entered into by Mr. Cowlin for the completion of the entire church at £4,839, subject to a deduction of £739 should the funds not be sufficient to allow of the building being completed when the first portion is ready for consecration. The total accommodation provides for 334 sittings. The architect is Mr. John Bevan, of St. Leonard's-chambers, Nicholas-street, Bristol, whose design was selected in a limited competition on the award of the late Benjamin Ferrey, F.S.A., who acted as referee. Mr. Bevan has also just been appointed architect to the Paulton Burial Board for certain works in connection with Holy Trinity Church, Bristol.

CREWE.—A new chapel, which has been built for the Wesleyan Connexion in Earle-street, Crewe, was opened on Wednesday week. The chapel is a brick edifice. Mr. G. B. Ford, of Burslem, is the architect, and Mr. M. Grosvenor, of Tunstall, the builder. The measurement inside is 56ft. by 42ft., and the height from the floor to ceiling is 29ft. There is sitting accommodation for 300 people; there is also a transverse gallery which will give further accommodation to about 150. Behind is the schoolroom, so arranged that, when required, it can be used as an extension of the chapel. The schoolroom has two stories, each measuring 50ft. by 21½ft., and will accommodate nearly 500 scholars.

DALWOOD.—On Wednesday week Dalwood Church, Devon, was reopened for public worship, after having been closed for the four years. The total cost of restoration has been rather under £1,000. The architect has been Mr. Edmund B. Ferrey, of 15, Spring-gardens, London, who has carried out the designs prepared four years since by himself and his late father, Mr. B. Ferrey, F.S.A. The builder has been Mr. Berry, of Honiton, the first contract having been executed by Messrs. Hutchings and Berry. The church, which is of 15th century work, although small and only providing accommodation for about 190 people, is now clean and comfortable. The north wall of the nave, with its piers and arches opening out into the north aisle, has been rebuilt, having been much out of the perpendicular. All the old stone has been reused. A new roof of Portmahoe slates covers the nave and chancel. The west gallery has been pulled down, and the tower-arch opened out. The pews have been replaced by new stained deal open benches, except in the chancel, where there are

handsome English oak seats, with a prayer-desk. The old Jacobean oak pulpit has been cleaned and refixed on a new base of Ham Hill stone, with Pennant steps. The porch has been rebuilt, and a substantial roof put to it. All the windows have been reglazed with cathedral rolled glass in different tints. A vestry has been formed at the east end of the north aisle. The tower has been partially repaired, but owing to want of funds, some work still remains to be done there. The chancel-arches are built with Beer-stone. The walls have been replastered internally, and all the whitewash and yellow ochre cleared from the stonework. The north aisle roof has been substantially repaired.

FENTON.—On Wednesday week the corner-stone of a new mission church at Fenton, to be dedicated to St. Matthew, was laid. The cost of building and site will be nearly £2,500. Messrs. Scrivener and Son, of Hanley, are the architects, and Messrs. H. and R. Inskip, of Longton, the builders. The style is Gothic of a simple character, and the plan of the building is cruciform, with organ-chamber on the north side of chancel, vestry and porch on the south side, and a porch at the west end. The nave, chancel, and transept will be each 27ft. wide, and from east to west the church will have an internal length of 89ft. 6in. and across transepts, from north to south, a width of 70ft. The walls will be of brick throughout, with moulded brick strings and labels to arches, stone being little used, except for the tracery of the large windows and for coping to gables, &c.

HEREFORD.—The foundation-stone of a new water-tower was laid on Broome-hill on Monday week. It is expected to furnish a high-pressure supply of water to the highest floors of houses on Aylestone-hill, and will be carried to a total height of 103ft. The base will be 34ft. by 24ft. across, and will be carried, in masonry from the Three Elms quarry, to a height of 31ft.; above that level, the work will be executed in bricks, from the yard of Messrs. Ralph, Preece, and Co., with Bath stone dressings, and will be 32ft. by 22ft. across. The iron tank will have a capacity of 30,000 gallons, and will be supported on girders; the water will be pumped up by a Shone's injector and air-pump compressor. The contract has been taken at £2,030, by Messrs. Huxson and Warwick, successors to Mr. James Bowers, and the foundations have already been put in. Mr. George Cole, city surveyor, designed the tower.

JESMOND.—The Wesleyan Methodists of West Jesmond on Wednesday laid the memorial-stones of a new chapel and lecture-hall. The committee entrusted with the carrying out of the new works some months back invited a number of London and provincial architects to furnish them with designs. The result of the competition was that they awarded the first premium to the design submitted by Mr. J. J. Lish, of Newcastle. A tower forms part of the design. A form of Gothic architecture has been adopted, and the chapel will consist of a nave, aisles, and transepts. Behind, or to the south of the main buildings, will be three large class-meeting vestries, a ladies' vestry with cloakroom adjoining, a minister's vestry with lavatory, a very spacious "mothers' meeting" vestry, and a tea-preparing room. The organ and choir are to be placed in an apsidal end, forming a continuation of the nave, from which it will be divided by a deeply-recessed arch rising from grouped marble shafts with carved caps. The angles of the apse will be occupied with marble columns carrying moulded-arch ribs springing from Decorated capitals. The ceiling will be coed, and so planned as to throw the whole volume of sound directly into the nave. Galleries will run round three sides of the building, and will be approached by three distinct staircases in convenient positions. Sitting accommodation is arranged in the chapel for between 800 and 900 persons, and in the lecture-hall for 350 persons. Messrs. Lishman and Siltor, Ryton, are the contractors entrusted with the carrying out of the works.

NORWICH.—In contemplation of the intended reopening on Tuesday next, October 4th, after restoration, from the designs of Mr. G. E. Street, R.A., F.R.I.B.A., of the cathedral-like church of St. Peter Mancroft, a special meeting of the committee was held on Tuesday week. A report was presented as to the work done, which as to the general fabric has been carried out by Mr.

G. E. Hawes, builder, of Norwich, under contracts. The windows throughout have been reglazed with cathedral glass in two tints, and the mullions repaired. Two entirely new windows, with tracery matching the rest, have been inserted at the west ends of north and south aisles, and nine windows in south clerestory completed. Two windows north and south of chancel, which were bricked up, have been opened out to their original sills. Seven new panels of stained glass in the east window and the Seaman memorial window are now in course of erection. The large turrets, one on either side of the east front, which were in a most dangerous state, have been taken down and rebuilt, under the clerk of works, on the old lines (Perpendicular in lieu of poor Renaissance). The roofs of nave and aisles were found to be in very bad condition, excepting in the north aisle of chancel. The principal oak timbers were utterly decayed, and cost about £700 more than was anticipated. The outer roofs have now a stout covering of asphalted felt between the oak boarding and the lead, which has been recast and relaid throughout. Twenty-four new stone corbels supporting the aisle-roofs have been carved and fixed. The organ has been removed and re-erected in the south aisle. The two vestries at the east end of church have also been restored, and in the course of the work an ancient piscina was found bricked up. When the old houses are removed from the south-east side of the church, a new stone staircase will be made to these vestries. An important alteration is the substitution of a stone cornice, with parapet and buttress heads, for the old wooden cornice, both on north and south side of the church. As to the tower, the works upon it have been executed under the personal supervision of the clerk of works, Mr. Ireson, who himself employed and paid the men. They include the repair of tower on its north, south, and west sides and its buttresses to the level of upper belfry windows. The modern tracery of the west window has been removed, and a new one of Perpendicular character, 30ft. by 13ft. 9in., inserted; this has been thrown open to the church, the ringers' loft being removed, and a stone screen erected on east side of tower. A letter from Mr. Street, dated from Aix-les-Bains, September 16th, was read, in which he reported that the work had been well and carefully executed, and he thought the results would justify the expenditure. Up to the present time he had been able to discover the original details of every portion renewed, and he had great satisfaction in announcing that at his last visit, he found concealed by a large cistern-head a portion of the original cornice of the tower. This consisted of a fine band of quatrefoils, between moulded stringcourses—not more elaborate than the one which he had contemplated before this discovery. As to the upper buttresses, their condition was very bad; indeed, he had never seen stonework in a worse condition. The committee, after hearing the reports, resolved to proceed with the work upon the tower uninterruptedly to completion, and to make a new appeal for the £3,000 or £4,000 that would be required for that purpose.

PETERSFIELD.—Churchers' College, on the London and Portsmouth highroad, was opened on the 15th inst. It has been erected from the designs of Messrs. G. R. Crickmay and Sons, of London and Weymouth, whose design, under motto "Thoro," was selected in 1877 by Mr. Ewan Christian, the official referee to the governors of the college, from five sets invited. The building is arranged with head-master's house at south-west corner, the kitchen and matron's department at north-west corner, and the school running eastward from between the two. The school-buildings proper comprise a series of rooms on either side of corridor, including dining-hall, library, and committee-room, with schoolroom at eastern end. On the floors above are dormitories, assistant-masters' rooms, and the lavatories and bath-rooms. Accommodation is provided for 50 boarders and 100 day-boys, with facilities for future extensions. The building has hollow walls, and is faced with Godalming Bargate stone, with Box-ground dressings, the roofs being covered with Hols-worthy tiles. The staircase and corridors are fireproof, the windows are sashes opening top and bottom; the floors of chief rooms are laid with solid wood blocks, herring-boned; open fireplaces are provided throughout, and Galton's ventilating grates placed in dining-hall, library,

school, and classrooms. The cost has been about £13,000, exclusive of site of ten acres, which was given.

SALHOUSE.—The restoration of the somewhat singular church of Salhouse is progressing, and the building will be reopened after complete renovation next November. Salhouse is some five miles north of Norwich. Its parish-church, dedicated to All Saints, is a plain old building, consisting on plan of chancel, nave, north aisle, and tower. Nearly all the south wall of the nave has been rebuilt in rubblework as before, the old roof of the tower has been removed and recovered, and the steps leading to the tower repaired. The nave-roof has been stripped of its thatch, and a strong and handsome one of English oak has been erected. This is covered by a layer of reeds to a thickness of about 15in. A south porch has been added—the walls of Trapp flint and the dressings of Ancaster stone. The stone carving has been executed by Mr. Harry Ilemas, of Exeter; the builder is Mr. George Dobson, of Colchester—his general foreman being Mr. George Stow. The works are being carried out from the designs and under the immediate superintendence of Mr. John Oldrid Scott. The estimated cost of the present restoration is £3,500.

SHEFFIELD.—The new Corn Exchange buildings in Sheffield, which cover an area of about 1,500 square yards, and which are now on the eve of completion, were inspected on Monday, by the proprietor, the Duke of Norfolk. The structure is in the Late Pointed or Tudor style of English architecture, the principal façade being 22ft. in length. In the central part of the front is a tower, at the base of which the main entrance to the Exchange has been placed. To right and left of this entrance are offices or shops entering from the street. These are continued along the fronts facing Broad-street and the Canal Warehouse. The length of the building in these directions is 135ft. The thin red bricks used in the walls are of the best description, and the stone facings are from the Bolehill Quarry, Treeton, near Rotherham. Broseley tiles have been utilised for the roofs. In addition to the Corn Exchange hall itself, there are within the extensive premises suites of offices, including those for the Duke's agent, which will occupy the chamber floor of the south and west wings. In the tower to which reference has already been made a fireproof munition-room has been built, wherein will be preserved the deeds and records connected with the Duke's Sheffield estates. Messrs. M. E. Hadfield and Son, the architects, have already entered upon the occupancy of offices over the main entrance. Branching off from the entrances, arcades have been erected in which saleshops have been fitted up, the shops being on a level with the street. The north-west corner of the buildings has been designed for an hotel, to which accommodation for a restaurant is attached. The hotel contains commercial-room, three private sitting-rooms, 32 bedrooms, and all the other apartments necessary in a first-class establishment. The whole of the buildings are cellared, and the total cost of the structure exceeds £60,000.

STAPENHILL.—On Wednesday week was consecrated the newly-erected and enlarged church of St. Peter, Stapenhill. The entire cost is estimated in round figures at £10,500. Messrs. Evans and Jolley, of Eldon Chambers, Nottingham, and Burton, were entrusted with the designs, and the work has been carried out under their superintendence. The style is Late Decorated; it is a plain but substantial structure, the walls being of Derbyshire stone, with dressings of Bath and Ancaster stone. There is a nave, 60ft. long by 32ft. wide; chancel, 30ft. long by 32ft. wide; transepts, 21ft. by 21ft.; and aisles, 60ft. by 17ft. The vestry is against the north transept. There is also a porch leading into the south aisle, and the tower forms an internal porch in the west bay of the south aisle. The tower, which is not yet completed, will reach about 100ft. in height, or 55ft. above the windows, and will be surmounted by a pinnacle 21ft. above the coping of the battlement at each corner. The church contains sittings for about 900 persons.

A new theatre has been built at Darlington on the site of the old building in Northgate. Mr. W. Hodgson, of Darlington, has been the architect. Accommodation is afforded for 2,500 persons.

COMPETITIONS.

AUSTRIAN COMPETITION FOR SEAT-FURNITURE.—The Section for Wood-Industry of the Technological Gewerbe Museum, in Vienna, proposes an international competition, from Dec. 1, 1881, to April 1, 1882, in technical novelties in production of seat-furniture. Applications may be made up to Nov. 1. All objects sent for competition will be exhibited in the museum. Drawings and models are excluded. For reward of meritorious work, the Lower Austrian Gewerbeverein provides ten silver and twenty bronze medals.

NOTTINGHAM.—Some time since, the Corporation of Nottingham, on the recommendation of the health and improvement committees, issued advertisements inviting "architects, surveyors, and others to send in maps, plans, designs, particulars, and estimates for laying out and utilising" an unhealthy area lying between Upper Parliament-street, the Row, and Greyhound-street. Premiums of fifty guineas and twenty-five guineas were offered for the best and second-best designs, such premiated plans to become the property of the town council, and the date for sending in plans was fixed at August 1st. The time was, at a late period, extended by a month, but no award has been made up till the present time, owing to the absence, on holiday, of the consulting engineer to the town council, Mr. M. O. Tarbotton, and in the mean time it has become somewhat doubtful whether any improvement scheme will be carried out. Nine plans have been sent in, and have been exhibited. The mottoes and schemes adopted by the competitors are:—"Just What's Wanted," shows a covered market, 190ft. by 120ft. on the centre of the area. "Sweetness and Light" provides three parallel avenues, the central one 45ft. and the side ones 30ft., between Parliament-street and the Market-place, with cross streets, and estimates the total value of sites at £33,250, of which £25,000 is allowed for the central avenue. "Albany" devotes an unusually large area to streets—4,847 square yards, leaving 7,751 for building allotments; the scheme shows one broad street from Long-row, cutting through smaller cross streets. "Take Aim from the Mark," has planned one main street, from the Market-place, 51ft. wide, the sidewalks being covered in with glass roofs as piazzas; on one side is a cross street, 41ft. wide, and on the other one 40ft. wide. "Maltese Cross" shows the centre of area occupied by an open space, with fountain, surrounded by four blocks of shops with covered arcade surrounding each block. "Hoppus," sends two alternative plans, both dealing with a very much larger area than that condemned, and proposes new and wide thoroughfares, connecting Parliament-street, the Market-place, and Clumber-street. "Prosperity to Nottingham" also deals with a considerably larger area than that originally contemplated, his main proposal being a street between Long-row and Parliament-street, with a crescent-formed link to Market-street and an entrance from the Market-place. "Lux et Aer," designs a T-shaped street, constructed from Long-row, with branches to right and left, and a central block of business premises with a covered arcade. "Cube" proposes to cut two wide streets from the Market-place to Parliament-street, with a suggested guildhall between them. Incidental to the above scheme, but outside the advertised conditions and recommendations of the corporation, Messrs. Parry and Walker, civil engineers, of Newcastle-chambers, Nottingham, have submitted a plan for the formation on the site and adjacent property, of twice its area (in all 10 acres of land), of a central railway station, for the joint use of the Midland and Great Northern Companies. The total cost of the scheme, approaches and connecting lines of railway, is set down at one million. The Midland Company have, however, just expended several thousand pounds on improving their present station.

RICHMOND, SURREY.—The directors of the Richmond Gas Company recently advertised for designs in competition for new offices, &c., and the following extract from the Chairman's speech at the half-yearly meeting of the Company is taken from the *Surrey Comet*:—"They had offered premiums to architects in general for the best plans of the proposed new offices. They thought it was better to do that than to select any one person; and have it said after-

wards that it was a hole-and-corner business. Fifteen competed, and their plans were sent in each with a motto and sealed envelope. He believed he might honestly say the directors had no idea who were the owners of those mottos. They fixed unanimously upon one plan, and when they had opened the envelope marked 'Lux Tenebrarum,' and saw the name of the person to whom it belonged, they were glad to find it was one of their own townsmen, Mr. F. Brewer, who had carried off the palm. It was a very nice plan, and all the details were in accordance with what the directors wished, and he thought it did very great credit indeed to Mr. Brewer. Well, that was the position in which they stood now. They had their plans, and competition for the building would also be invited, and the best man would get it. He did not believe there were two opinions about the plan itself, which was admirable in all its details, and he believed the building, when erected, would be a great advantage to the company as well as an ornament to the town."

ARCHÆOLOGICAL.

DISCOVERY OF A ROMAN MONUMENT.—On Wednesday, Sept. 21st, a remarkable Roman monument was discovered in the porch of Hexham Abbey Church. Mr. Charles C. Hodges, an architect now engaged in bringing out a series of illustrations of the church, and Mr. Robert Robson, the clerk, while excavating in the Sloppe on Monday evening, came upon a large slab a few feet below the surface. On further investigation on Wednesday, a monument 5ft. 6in. long by 3ft. 6in. wide, in a state of excellent preservation, was disclosed, the upper portion containing a figure of a mounted warrior, bearing in one hand the Roman standard, surmounted by an eagle. He appears to have slain a foe in his career, the latter being in a crouching position beneath the horse's fore-legs, and grasps in one hand a sword. Below this is a tablet with the following inscription:—

DIS MANIBVS ELAVNVS
EQ ALAE PETE SIGNIFER
TVR CANDIDI AN XXV
STIP VII HS

From this inscription it would appear that the hero of this monument was a standard-bearer in the Troop Candidi of the body of cavalry known as the Ala Petriana. The whole drawing and carving shows the most spirited handling, and is as fine a specimen of Roman art as is to be found in Northumberland. The stone has been a mural tablet in a cemetery, against the wall of which it probably rested, and on which the present Abbey presumably stands. Part of the base of the stone, just below the inscription, was beneath the foundation of the wall, and has been detached by the pressure from above. Otherwise it is uninjured. It is supposed to be between 1600 and 1700 years old; but the exact date will have to be decided by subsequent information as to the time at which the troop referred to in the inscription was stationed in this neighbourhood. How the same came to be in the position in which it was found must, of course, remain matter of conjecture. One theory is that it was placed in the foundations of some of the Saxon buildings which occupied this site, as its upper surface was covered with mortar, and other stones were placed on the top of it, and many large and rough stones have since been found beneath it—just such as would be placed in the foundation of a thick wall.

The Llantrissant burial board held a special meeting on Thursday week to consider their position with reference to the contractors for the new cemetery at Llantrissant, Messrs. Taylor and Son. At the previous meeting the board heard complaints as to the manner in which the contract was being carried out, the chief being that the drains were being tiled with loose stones of larger gauge than those specified by the architect and surveyor, Mr. Jenkins. As a result the board discharged Mr. John Morgan, clerk of works, summarily and unheard, and since then several members protested against this as unfair. It was now stated that the majority of the stones were of proper gauge, and that large ones are exceptions, and the contractor declined, in consequence of the attitude taken by the board, to stop the drains. The board determined to retaliate by withholding further payments on account, and there is every symptom of the creation of an expensive arbitration case.

"To a practical man with a taste for mechanics, and the bumps of constructiveness fairly well developed, we can conceive no higher mental treat than a couple of hours spent over the June numbers of that truly marvellous publication the *English Mechanic*. In a hundred and fifty odd pages that make up the bulky mass of letterpress, there is recondite information on almost every conceivable subject, ranging from how to construct a mouse-trap, to the latest method of calculating the phases of Orion.—*The Brightonian*. Price Two pence of all newsmen, or post free 2½d.—31, Tavistock-street, Covent garden, W.C."

TO CORRESPONDENTS.

(We do not hold ourselves responsible for the opinions of our correspondents. The Editor respectfully requests that all communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondence.)

All letters should be addressed to the EDITOR, 31 TAVISTOCK-STREET, COVENT-GARDEN, W.C.

Cheques and Post-office Orders to be made payable to J. PASSMORE EDWARDS.

ADVERTISEMENT CHARGES.

The charge for advertisements is 6d. per line of eight words (the first line counting as two). No advertisement inserted for less than half-a-crown. Special terms for series of more than six insertions can be ascertained on application to the Publisher.

Front Page Advertisements 2s. per line, and Paragraph Advertisements 1s. per line. No front page or paragraph advertisement inserted for less than 6s.

SITUATIONS.

The charge for advertisements for "Situations Wanted" is ONE SHILLING for TWENTY WORDS, and sixpence for every eight words after. All Situation advertisements must be prepaid.

Advertisements for the current week must reach the office not later than 5 p.m. on Thursday. Front page advertisements and alterations in serial advertisements must reach the office by Tuesday to secure insertion.

TERMS OF SUBSCRIPTIONS.

(Payable in Advance.)

Including two half-yearly double numbers, One Pound per annum (post free) to any part of the United Kingdom; for the United States, £1 6s. 6d. (or 6dols. 40c. gold). To France or Belgium, £1 6s. 6d. (or 33s. 30c.). To India (via Brindisi), £1 10s. 10d. To any of the Australian Colonies or New Zealand, to the Cape, the West Indies, Canada, Nova Scotia, or Natal, £1 6s. 6d.

Cases for binding the half-yearly volumes, 2s. each.

NOTICE.

Now Ready.

Vol. XL. Price 12s. A few bound volumes of Vol. XXXIX. may still be had, price Twelve Shillings; all the other volumes are out of print. Most of the back numbers of former volumes are, however, to be had. Subscribers requiring any back numbers to complete vol. just ended should order at once, as many of them soon run out of print.

RECEIVED.—B. and B.—R. G. B.—B. and J.—T. P. L.—J. H. and S.—H. A. Y.—C. B.—G. B. G.—H. T.

"BUILDING NEWS" DESIGNING CLUB.

The reason why the addresses were not given with the mottos in all cases was that the competitors did not send their names and addresses.

Correspondence.

"WAYSIDE NOTES IN THE WEST."

To the Editor of the BUILDING NEWS.

SIR,—I fear your correspondent "M.'s" hope that Gloucester Cathedral may long preserve its centrally placed organ and screen, is doomed to be disappointed. A month since, I spent a few hours in the Cathedral, and, when pumping the verges as to works completed, in progress, and to come, he mentioned that the Dean and Chapter were then consulting with their architects, Messrs. Waller and Son, as to the desirability of abolishing the present organ, removing the solid stone screen, and opening out the vista from east to west. I expressed a desire that the scheme might be rejected, fearing that it would tend to diminish the apparent size of the Cathedral and destroy the effect of mystery, but the verges said: "You may depend on it, the organ will have to come down, for it is not good enough nowadays, and when they put up a better one it will be divided and placed above the stalls on either side." I give the correction for what it may be worth.

While writing, may I ask "M." for chapter and verse of Cathedrals in which the late Sir Gilbert Scott was guilty of removing the organ-screens and organs? I have visited all the cathedrals which he restored, and remember several still retaining these features, although Hereford, Worcester, Lichfield, and Ely, it is true, have now only open metalwork screens.—I am, &c., EAST ANGLIAN.

SIR,—Your correspondent, "M.," in his remarks on Gloucester Cathedral, implies that the

late Sir Gilbert Scott's practice was to remove the solid choir-screens, with their lofts and organs, from the cathedral churches he was called upon to restore. Had "M." visited other cathedrals restored by the same architect, he would have found that Gloucester is not so exceptional in the matter of the screen, and in the position of the organ, as he seems to think it is.

The following churches, which have passed through the same hands, retain their screens, with organs upon them:—Gloucester, Ripon, Manchester, Exeter, Canterbury, Rochester, St. David's, Darlington, &c. In Beverley Minster, a double screen, with wide loft to receive the organ, has been erected.

Although Worcester has a light open screen, the original design was for a double areaded screen of stone and marble, carrying the organ. In the case of Exeter, the architect, wishing to maintain the screen, had to struggle against a strong party clamorous for its removal, the result being a compromise, by which the wall next he returned stalls, forming the eastern side of the screen, was in part cut away, forming large pinnings.—I am, &c., VIATOR.

SIR,—On reading the above in your last week's issue, I was vexed to see the following: "One can never see Chepstow Church without bitter regret at the stupid alterations which, under the name of restoration (hateful word), took place about forty years ago. I think it is a pity architects should be paid for church restoration. Certain it is, that the 5 per cent. system is a bad one. There are few architects but will make work for themselves, under the temptation of this inducement," &c. It is bad enough to hear the members of our unfortunate profession called hard names by "outsiders," but I think such an assertion as this, made by your correspondent "M.," in a leading architectural journal like the BUILDING NEWS, ought not to pass unnoticed, charging as it does all but a "few" architects with being led by such mean and dishonest motives. I hope "M." is not an architect; because if he is, he must have met with the "black sheep" of the profession (which I hope are the "few") to form such a bad opinion of the rest of the flock. Fancy an architect, with any love for his art, sacrificing old work for a paltry 5 per cent. commission on the new! When will there be more *esprit de corps* among architects?—I am, &c., PROVINCIAL.

HOUSE-TOP GARDENS.

SIR,—Any one who travels by the North Kent line must have been struck by the dismal expanse of tile roofs and crooked chimneys—like dogs' hind legs—that distinguishes the district about Bermondsey. We seem to have got into a groove, in the matter of roofs, we cannot escape from—these everlasting tiles—is there no chance of improvement within our reach? Take, for instance, a middle-class house finished to the eave. Let us put a watertight flat on the top of it: over this, throw angle iron or even wooden frames of the usual hip-roof shape; the sides of this, about 8ft. or 10ft. high, I would cover with rolled glass, the semi-transparent kind to be seen in our Lancashire factory windows. Cover the top with tiles, which are here in their right place, to keep the sun's heat out, and we have roofed our house with a winter-garden, wherein "Pater" may smoke his after-business weed, sitting under the shade of his own vine, surrounded by the roses and ferns grown by his own wife and daughters, to the great improvement of the roses on their own cheeks by reason of the semi-outdoor life they lead in the airy roof-room! What a place for an evening-party!—the flowers and vines round the wall forming the prettiest of all backgrounds to the pretty faces; and there will doubtless be many nooks among the greenery wherein a man may spon on his heart's content. Truly, the prospect sounds exceedingly Catholic and wholesome! Now for that flat roof: starting with a groundwork of rolled-iron beams, one end built into the wall, the other resting on a roller, so that expansion cannot bring much strain on the walls. We might lay corrugated-iron sheets on, one edge being riveted to the beam, and the other edge left free to expand over its fellow, so that the expansion in one direction is taken up by the corrugations of the iron, and in the other directions by the slipping of the sheets over one another, fitting up the

corrugations with lin. or so of asphalt and sawdust. We may now lay what floors we will—say, asphalt, with Minton tiles embedded in it round the edge. So we shall attain our wishes, and introduce a perfectly new feature into English town life. Why should it not be done? F. M.

STABLE FLOORS.

SIR,—In your edition of the 23rd inst., page 387, column 2, you write, "Asphalt is slippery, however otherwise suited, and it is *thought* doubtful if its advantage over cement is worth the additional expense."

So much for your theory. Now for facts. The following is from the Earl of Leicester's steward:—

20th May, 1881.

Lord Leicester's coachman, who has been here twelve years, says that he does not wish for any better floor than your asphalt, which was relaid in the stables here in 1855. I remember its being laid in 1843, and again in 1855, and am of the same opinion, that for such stables no better floor can be found; but care should be taken before the floors are laid to arrange so that the stable drains can be examined, and, if necessary, cleared without breaking up the floor, which was overlooked here.

Should this not be convincing, then visit the Duke of Sutherland's stables, St. James's, erected under the late Sir Charles Barry in 1843, and paved with asphalt, as also the coachhouse floors and stable-yard. I have had many occasions to seek permission to inspect the work with gentlemen contemplating the use of the material, and the result has always been the adoption of it.—I am, &c., J. FARRELL, Sec.

Claridge's Asphalt Co., Sept. 26, 1881.

HOUSE-DRAINAGE, AND SEWER AND GULLY VENTILATION.

SIR,—I was pleased to observe in your valuable paper of the 16th inst., the important letter of Mr. W. P. Buchan on this subject, whose views are sustained by reference to that eminent authority, Mr. Rawlinson, C.E.

Having used Messrs. Beard and Dent's siphon sink-trap with plug, I can speak as to its effectiveness. The plug being under the sink, the grating can be soldered down, thus effectually excluding flannel, spoons, forks and other articles which frequently find their way into the sink, and where there is a movable grating often pass into the drain.

The cleanliness and other advantages mentioned by Mr. Buchan, resulting from the discharge of waste water into the outer gully-trap under the grating, instead of over, cannot be disputed, and should any foul air be generated in the discharge-pipe, the siphon, and the absence of pressure would exclude it from the house.

Your correspondent, "C. F. M.," calls attention to untrapped gully-holes, the serious evils resulting therefrom, and the importance of providing for the ventilation of the sewers. It is impossible to over-estimate the importance of this subject. Many fivers might no doubt be traced to noxious vapours emanating from street-gullies, intensified in many cases by the trapping of house-drains in compliance with the by-laws of local authorities, without that extra provision for the ventilation of sewers, which thereby becomes necessary. I should, like, Sir, with your permission, to invite an expression of opinion as to the practicability and economy of trapping and ventilating street sewers in some such manner as the following—viz.: By trapping with siphon and manhole each end of every street, and ventilating the intermediate spaces with charcoal deodorisers, or otherwise, which would prevent the excessive accumulation of sewer-gas in any one place. This arrangement, it appears to me, would allow of the disuse of many costly sanitary appliances, and diminish liability to disease. I think it would confer a boon on the public if Mr. Buchan and other scientific gentlemen would kindly express their views on this subject, and thus supply information which would be valuable in the compilation of sanitary by-laws.—I am, &c., S. T. G.

Richmond, S. W., Sept. 22.

DAVIES' O-TRAP.

SIR,—On reading Mr. Davies' letter, on page 409, I referred to mine upon page 375, and found a printer's error. The size of the pipe

between the valve and the seal of the trap was 1½ in., and not 1 in. as you have in error stated.

In reply to Mr. Davies' other points, I will only say that I am carrying out my experiments with full-size traps, in the fullest and most careful manner, and shall be prepared, when the proper time comes, to prove all that I have advanced, or may advance, for which purpose I shall be very pleased to meet Mr. Davies at any public meeting of plumbers and practical judges in London; and if agreeable and convenient to Mr. D., I will meet him beforehand, so that we may agree as to our traps and programme, and thus avoid the possibility of any dispute at the meeting. By this means we should be able to come at this matter nearer than we are likely to do by letters.—I am, &c., DANIEL EMPTAGE, S.E.

Dane-hill Sanitary Works,

Margate, Sept. 24.

CHIPS.

The dock extension at Penarth, Glamorganshire, was commenced last week. Mr. H. O. Fisher has been appointed resident engineer, and Mr. Walker, who is just completing the extensive new docks at Swansea, is the contractor.

Extensive works of sewerage are about to be carried out for the Leyton local board in the districts of South Leyton and Temple Mills. Messrs. Bailey Denton, Son, and North, in conjunction with Mr. C. F. Gower, are the engineers.

Plans prepared by Mr. Henry Stone, of St. John-street, Bedford-row, London, W.C., have been accepted for the completion of All Saints' Church, Walton-on-the-Naze, and the work will be commenced shortly.

A stained-glass window has been placed in the north side of nave of Saddleworth parish church, near Huddersfield, as a memorial to the late vicar. The subject is Christ Disputing with the Doctors in the Temple. The work has been carried out by Messrs. Lawton and Broadbent, of Upper-mill.

At Darlington on Monday night the theatre in Northgate was opened, after having been rebuilt on an enlarged scale from the plans of Mr. W. Hodgson, architect, of that town. It now accommodates 2,500 persons.

The town council of Aberystwyth last week raised the salary of the borough surveyor, Mr. Rees Jones, by £20. At the same meeting it was reported that the new works of water supply in course of construction under Mr. Stooke, C.E., would be virtually completed by the second week in October.

The county magistrates of Dorsetshire have adopted plans prepared by the county surveyor, for the reconstruction of the Backwater-bridge at Weybridge, a wooden structure about 666ft. in length.

The new church of St. John, Lescudjack, Penzance, is to be consecrated by the Bishop of Truro, on Tuesday next.

At a public meeting held in Ipswich on Thursday week it was decided to take steps for forming a limited liability company for the purpose of establishing public baths at the foot of Fonnereau-road, St. Margaret's. The proposal by the promoters, to aim at a capital of £2,000 only, was smartly criticised, it being suggested that this would be insufficient to provide baths of adequate size.

A new Baptist chapel was opened at Yarningdale Common, Henley in Arden, on Tuesday week. It was designed and erected by Mr. John Smallwood, of Wootton Waven.

A new organ, double manual, with 600 pipes, was opened at Bourton-on-the-Water Church on the 21st inst. It was built by Mr. C. Martin, of Oxford.

The Unitarian chapel at Swansea was reopened yesterday (Thursday) after internal reconstruction, repewing, and decoration. The general works were executed under contract by Messrs. Thomas Watkins and Jenkins, the pew alterations by Mr. John Davies, and the refurnishing by Messrs. B. Evans and Co., all under the supervision of Mr. Holt Huxham.

A loan exhibition of fine art is about to be held in the castle-hall, Taunton.

The town council of Guildford received on Tuesday week a report from the sewerage committee, who recommended, after visiting several towns, that a system similar to that used at Twickenham and Aldershot should be adopted. It was resolved to call in a consulting engineer to advise the authority, the choice to be deferred till the next meeting.

The Sanitary board of guardians have adopted plans by Mr. Musgrave, architect, of Hull, for the extension and improvement of the workhouse.

Intercommunication.

QUESTIONS.

[6679].—The White House.—Why is this well-known building at Washington so-called? When was it built, and by whom? Is it of marble?—SCOLLER.

[6680].—Painting Vinery.—Will any of your readers kindly answer me the following:—What is it worth per yard to paint a vinery four coats plain colour, the work measured inside and out? Length of vinery, 36ft.; width, 17ft.; length of rafters, 21ft. The roof consists of eight bays of glass, the front and ends being in the same proportion. Is it usual to deduct one-third the measurement for glass when the full price is charged?—A SUBSCRIBER.

[6681].—Beer Stone.—In your report for the current week (Sept. 16) is an account of a visit paid by West of England architects and other gentlemen to the celebrated quarries at Beer. Amongst the names of those present is that of Mr. Harry Hems, of Exeter. Mr. Hems is well known to us all as a thoroughly practical man, and an instructive and prolific writer upon many subjects. Will he kindly say whether he thinks Beer stone a good workable material, and if it has really been as largely used in ancient churchwork as those interested in it assert it to have been? If so, when and why did it fall into disuse?—ENQUIRER.

[6682].—Printed Reports in Competitions.—A few months ago I was asked to furnish a set of plans in competition for a new church, and in the conditions to architects it was stated that along with their plans they should furnish a specification describing their design, and the kind and quality of the material to be used in its construction, for the purpose, I suppose, of enabling the committee to come to a proper decision. Along with my plans I sent several printed copies of my report for distribution amongst the committee, and addressed them to the convenor as instructed, but the distribution of which was objected to, because it was considered an unjust procedure on my part sending printed copies of my report when the other competitors had forwarded only written reports (one each), and therefore they considered that I would have an advantage over the others. My main reasons for printing my report were to enable each member of the committee to study and fully understand my plans for himself, and, secondly, the competitive plans being sent in under a motto, I hold that a written report is a means of disclosing the author of certain plans by their writing, and therefore to avoid this mine was printed, and I have yet to learn that information given in a printed form to each member of committee is acting less in the spirit of the conditions than a merely written communication. Would any reader say, through your columns if my procedure has been unjust, or has been such as should be avoided in future? Because, if it is so, as in the opinion of the committee it seems to be, the result is that the less information one can give to a building committee in submitting plans the better!—ENQUIRER.

[6683].—Cost of Caissons.—I notice in your last issue you give the size of one of the largest caissons in the world. Can any of your readers kindly tell me the cost of same, and also the approximate cost of a caisson 66ft. long 25ft. high, with a breadth of 15ft.?—A. J. S.

[6684].—Figures of Saints, &c.—Can any of your correspondents kindly inform me of any illustrated work in outline, of the Apostles, Saints, &c., of the English calendar, with their emblems, suitable for reference for an architect?—M. F.

[6685].—Variation of Compass.—What is the present variation of the compass in Kent?—P. PLAYFAIR.

[6686].—Hedges.—Is there any rule as to which property hedges and fences belong? In West of England the south and west hedges seem to be included in the property measured.—P. PLAYFAIR.

[6687].—Chimney Shafts.—Are there any regulations as to the construction of chimney shafts for factory purposes, published by the Metropolitan Board of Works or other authority except what is stated in clause 10, sec. XX., cap. 122 of 18 and 19 Viet.? There must surely be some orders about heights and the thicknesses of independent shafts.—P. PLAYFAIR.

[6688].—Durham Cathedral.—Montalembert speaks of the Cathedral church of Durham as being one of the seven rival churches of Christendom. Can any reader of BUILDING NEWS give me the names of the other six?—DUNELM.

[6689].—Washable Distemper.—Will any reader give me some information respecting washable distemper? What ingredients are used, and what are their respective quantities?—ANGLICANUS.

[6690].—Institution of Surveyors Exams.—When are these held? Is it compulsory to pass preliminary before final? After passing final, does the candidate become a member of the institution? Any further information will oblige.—W. H.

[6691].—Deductions in Brickwork.—Will some correspondent kindly say what is the usual custom, especially in the Northern counties, as to deductions in brickwork where stone dressings occur? Of course ordinary sills or heads would not be deducted, but in the case of quoins having copings, &c., I contend that the stone ought not to be measured in with brickwork, in order, as a builder alleges, "to allow for mortar" which he finds for mason.—YOUNG SURVEYOR.

REPLIES.

[6619].—Roof.—I would like to support the answer to this question given last week by "G. H. G.," it appears to be on the whole very correct, and the only part I can find any real fault with is in supposing the slightest possibility of the thrust of such a roof on the walls being "nil." I do not believe "G. H. G." means this to be understood, as he considers there should be at least thick walls with buttresses. A more scientific roof would be to do away with the cross braces and substitute a collar, lengthen the wall struts to join the principals, keeping,

however, the joints therewith below the joints of collar and principals. I would also add two small braces between the feet of principals and the wall struts, to prevent the latter breaking so readily by bending; these braces serve the same purpose as herring-bone strutting between floor joists when the span requires it. This roof would be much cheaper than the one proposed by Dennis, besides being much stronger; the walls also require less thickness. "Dennis" is moreover I think wrong in supposing the truss to be only loaded with 34 tons; it would have been better had he given the distance between the centres of two trusses supposing them to be equally spaced. He should allow for 52lb. load per sq. foot on the truss, 40lb. thereof to be allowed for wind pressure and the remainder for weight of roofing material. I had intended to give more information but have not found time; next week I may possibly do so.—HUGH McLAUGHLIN.

[6650].—**Ventilation of Soil-pipe.**—The reply of William H. Butler, on p. 142, ought not to be allowed to pass without correction. He says that for ventilating soil pipes, and he seems to also include drains, he had "used all the corks in the market, and for the above purpose considers them useless." Now, I doubt his statement as to using all the corks in the market. Will he tell me, e.g., the size and number of the one of my mixed 1 C. ones he used, and where he got it? Further, if he considers a good cork "useless," I, in a large and varied practice, have not only found it useful, but even necessary in many cases—*inter alia* at a job for the Clyde Trust at Dalmar, in 1879, where the ventilating pipe of the soil pipe was carried up outside the wall, and several feet above the gutter, the inlet air opening if the drain trap proved a nuisance to the manager whose house it was at, owing to the foul air coming out at the ground level instead of above the roof, but so soon as the soil pipe was capped with an 1 C. fixed ventilator the complaint ceased, and eight months after it was certified by the engineer that everything was working satisfactorily, and it has done so for two and a half years. Take off the cork, however, and complaints would soon be made. I could mention other cases, and can easily give the practical and scientific explanation of how and why the addition of the cork improves matters.—W. P. BECHAN.

[6651].—**Ventilation of Soil-pipe.**—As well as doing what your correspondents suggest, "T. P. F." ought to carry the ventilating pipe above the ridge of roof. If the pipe is only carried a few feet above the gutter, it would, when the wind is in a certain quarter, act as an inlet, not an outlet. Let me advise "T. P. F." by all means to do away with the pan closet. This is undoubtedly the primary cause of the smell he complains of.—C. F. M.

[6652].—**Wood Block Flooring.**—Another way of laying these floors is to press the wood blocks down on hot asphalt. The blocks are splayed so as to be narrower at the bottom than at top. By this means only a thin asphalt joint shows. A floor of this sort has been done with oak at a cost of ten pence per square foot, but the pieces of wood were only one inch thick, in other respects about the same size as "Provincial" used.—C. F. M.

[6653 and 6656].—**Dimensions of School.**—"Alpha" can obtain the rules of the Committee of the Council on Education by writing to the Education Department at Whitehall, London, S.W. I do not know if stamps should be sent, but they are given free on personal application. National schools have generally been made from 16 to 20ft. wide. This width is in accordance with the named rules. Board-schools in many cases had been made wider, even as much so as to have a total width of 30ft. In National schools there are seldom more than three rows of benches and desks, but now in Board-schools four rows are more often used, six rows having been used in a few cases. There should be a width from 10 to 12ft. between the front row of desks and the wall for teaching and supervision, the teacher's desk is included in this space. The distance between the back of one desk and the next to it is given by the Council of Education as 2ft. 5in., and in galleries for infants 1ft. 6in.; 15in. should be allowed between one group of desks and that next to it, to allow of passage-way between. It is best to seat children only two to a desk that one may always move out of his place without disturbing any other children, this naturally requires more space, and is consequently more expensive, it has been done in a few of the schools for the London and some of the Provincial School Boards. "T. J. C." will therefore see that it is not advisable to give the lineal dimensions for 250 boys as it will vary with the number of rows of desks and also with the number seated at each desk; this should never be more than six and a larger number than four is not advisable. Desks are usually on the same level, infants are generally taught seated on low galleries, and desks then seldom provided. Windows are generally placed 4 to 5ft. above the floor.—HUGH McLAUGHLIN.

[6655].—**Museum Roof.**—Use a wrought iron arched principal with purlins of same material and then from that skeleton, frame your windows, &c. A good example is to be found in the new Corn Exchange, Mark-lane, London, in this the thrust of the main arches is counteracted by half truss or arches in the manner of Continental Romanesque vaulting. I believe the roofs of the galleries to the new Natural History Museum at Kensington, the Westminster Aquarium, and other similar buildings have roofs of arched construction. See drawings of Southport Winter Garden, illustrated in the Building News, Dec. 24, 1879.—HUGH McLAUGHLIN.

[6656].—**Plasterers' Work.**—In addition to information from Mr. B. H. last week, number the angles and keep external and internal separate. Angles have generally to be finished by hand after the cornice is run; internal angles have to be left to get out the moulds, external angles only require the mitring to be made good.—HUGH McLAUGHLIN.

[6657].—**Road Material.**—Allow 1½ yards of hard core and 20 cubic feet of blast-purified foot. A load and a cubic yard are each considered as having 27 cubic feet.—HUGH McLAUGHLIN.

[6658].—**Disinfecting Stoves.**—"H." only partly answered this last week. If "H." had visited the recent Medical and Sanitary Exhibition he would have seen several stoves, &c., for disinfecting. There are two sys-

tems the merits and demerits of which are much debated, these are hot-air and steam. The advocates of the former hold that the required pressure of steam cannot be raised, or if raised sustained, and that hot air does not destroy the linen or clothing as alleged. The advocates of steam directly contradict the former. Messrs. Benham and Sons, of Wigmore-street, supply both systems; Messrs. W. J. Fraser and Co., of Commercial-road, hot air, and Washington & Lyon's apparatus is also steam. These are all patented. The best plan is to go to some first-class heating engineer and trust to him.—HUGH McLAUGHLIN.

[6659].—**Religious Houses of the Middle Ages.**—"Inquirer" will find much information on the history of religious houses in England, with special reference to Cleeve Abbey and others in the South-west, in a little work by Mr. John Reynolds, member of council, and hon. assistant congress secretary of the British Archaeological Association, of Manor House, Redlands, Bristol. The title of the tractate is "Some Notes on English Monasticism," and the publisher S. Cox, Free Press, Williton. The price is probably 6d., or at most 1s. In a dozen concise pages Mr. Reynolds summarises what is known of the introduction of the religious orders and fraternities into England—their rise, growth, principal houses, decline, and suppression.—EAST ANGLIAN.

[6660].—**Rights of Light.**—If A. has enjoyed his lights for 20 years, B. cannot obstruct them. Twenty years' enjoyment of windows gives a right, and no one can in any way interfere with that light. But if they have been stopped up, that right is lost. If the property belonging to A. is a malthouse or manufactory, and B. partially obstructs his light, and the light admitted is still sufficient for the original purpose, an action cannot be maintained.—J. F. BELL, Bolton.

[6661].—**Interior Perspective.**—"A. B." cannot command a "full-length" view of his church from any position within its interior, as the range of distinct vision is contained in an imaginary cone, having an apex of about 60°, and if his picture extends far beyond this limit it will appear distorted and unsatisfactory. I would advise him to determine his station-point somewhere near the centre of the west end, and confine his picture to the above limits.—W. B.

[6662].—**Water Colour Painting.**—"If Art" has only limited means at his disposal, he could do no better than procure the water-colour subjects in Vere Foster's series, price 6d. each. I may also mention the series of lessons in neutral tint, sepia, and water-colour painting by R. P. Leitch, price 4s. 2d. each. If, however, "Art" requires more expensive and ambitious works, I refer him to Barnard's "Theory and Practice of Water-Colour Painting." There is also another work by Aaron Penley, entitled "The English School of Water-Colour Painting." The former is 17s. 6d., and the latter 12s. 6d. I advise "Art" to obtain the cheaper editions above referred to, as they are more suitable for a beginner. It is not the books that make a clever water-colour artist, but a keen observer of nature and effect, combined with a natural talent, and plenty of practice. A few practical lessons in mixing colours will save him a deal of time and trouble.—J. F. BELL, Bolton.

[6663].—**Mounting Lecture Illustrations.**—Of the three different kinds of paper "East Anglian" mentions in his query last week, cartridge paper is in my opinion the most suitable. Fasten the photographs to the paper with starch. When you wish to remove them lay the paper in cold water for an hour or so; afterwards they will float off uninjured. I successfully removed some this way a short time ago.—FRED. J. FREEMAN.

[6664].—**Schoolrooms.**—The width of schoolroom would be determined according to the number of scholars it would have to accommodate. Thus a full sized schoolroom to accommodate 250 boys should be at least 55ft. by 35ft. with ample means for ventilation and an open-timbered roof is to be preferred. The desks are best on same level, except for infants, when a gallery is more suitable. It is best to light the schoolroom on one side only, leaving the other free for maps, charts, &c., the blink wall generally dividing school from playground, and having master's desk and several presses fixed to it. The windows would not affect the teacher's eyes if not placed too close together, and having windows at each end of school is practicable. The height from floor to sill of window would be governed by the length of window and height of schoolroom from floor to wall-plate or ceiling; 3ft. 6in. or 4ft. would be enough. For size of desks, see "G. H. G.'s" reply to "Alpha" in last week's B.N.—J. F. BELL, Bolton.

A new church is to be erected near Brighton College, in the district of St. Matthew's, Kemp-ton, Brighton. The committee met at Brighton last Saturday, and decided to commence the new church forthwith, and to accept the tender of Messrs. Chappell, of Lupus-street, Pimlico, for about £10,470. The new church, to be erected from the designs of Mr. John Norton, of Old Bond-street, will accommodate 1,200 people. The plan comprises a nave and chancel, 100ft. long by 36ft. in width, and 27ft. in height; north and south aisles, organ-chamber and vestry south of chancel, and children's chapel on the north. The tower, forming an entrance-porch, stands on the south-western angle, and will be surmounted by a spire 250ft. in height, the walls faced externally with split flint and internally with Burgess-hill bricks, and the stonework without from quarries in Somersetshire.

On the advice of Dr. B. W. Richardson, the executive committee have decided to hold a health congress in connection with the projected sanitary and scientific exhibition at Brighton in December next. The Pavilion committee resolved on Monday to recommend the town council to grant the promoters the free use of the whole of the Pavilion buildings, including the Dome and the Corn Exchange, for a week.

LEGAL INTELLIGENCE.

HULL AND BARNESLEY RAILWAY ARBITRATION.—On Wednesday a Court of Arbitration sat at the Station Hotel, Hull, to assess the value of land owned by Messrs. John and William Harland at Willerby, which the Hull and Barnsley Railway Company had acquired by compulsory purchase in the construction of their line.—Mr. W. J. Beadle, Board of Trade surveyor, officiated as umpire, and sitting with him were Mr. M. Samuelson, C.E., acting as arbitrator for the claimants; and Mr. F. S. Brodbeck, acting in a similar capacity for the Hull and Barnsley Railway Company. Mr. Shaw, Q.C., Mr. Cyril Dodd, instructed by Mr. Birks (Stamp, Jackson, and Birks, solicitors), appeared for Messrs. Harland, and Mr. Balfour Brown, and Mr. Leadam instructed by Mr. Lowe (Lowe, Moss, and Moss, solicitors) represented the company. The land in question is owned both by Messrs. John and William Harland, separate claims being made on behalf of each. It was decided to take the claim Mr. John Harland first. The land affected, which measures 70,595 yards, is situate below the new railway embankment at the entrance to the village of Willerby. The company had run in a diagonal direction through the plot, of which they had taken 7,797 yards. It was contended by counsel for the claimants that this particular land was building-land, and that in going through it in the direction they had, and by constructing an embankment adjoining, the company had made it totally ineligible for building-purposes but had reduced it to land that was barely worth 6d. per yard. £1,364 9s. 6d. was claimed for 7,797 yards taken by the company; £3,691 10s. claimed for damage done to 24,610 yards at 3s.; £1,700 for damage to 17,000 yards at 2s.; and £1,589 2s. for damage to 21,188 yards at 1s. 6d.; making a total of £8,543 1s. 6d., or £1,172 10s. 9d. for each claimant.—Mr. W. H. Wellsted, C.E., Mr. Charles Johnson, auctioneer and valuer; Ald. Woodhouse, Ald. Dowsing, Mr. Samuel Musgrave, architect; and Mr. Joseph Beaumont, architect, Beverley, were each called in support of the claimant's case, which was concluded just previous to the adjournment for luncheon.—Mr. Balfour Brown opened the case on behalf of the company. He contended that the land in question was not and never had been building-land, but simply high-class accommodation land. He denied that such a large amount of damage had been sustained as alleged, and remarked that the whole of the claim was exorbitant. He called Mr. Digby Cayley, land agent, York, and Mr. John Coleman, agent to Lord Wenlock. Both these witnesses assessed the value of the land acquired by the company, and damage done to the remainder not purchased by cutting through it diagonally, and by erecting an embankment adjoining at a total of £665 0s. 11½d. They also said they considered the land was agricultural, and not building-land, nor was it likely to be within the next generation.—The company had other witnesses to call, but at this stage the inquiry was adjourned until the 4th November at the Surveyors' Institution, 12, Great George-street, Westminster.

STATUES, MEMORIALS, &c.

PROPOSED MEMORIAL TO DEAN STANLEY.—We hear that it is the intention of Dean Stanley's successor to take an early opportunity of calling a meeting to consider the best mode of raising within the walls of Westminster Abbey a monument to his lamented predecessor. A proposal which has already received influential sanction, as both appropriate in itself and likely to receive wide and general support, is that of an altar-tomb, with recumbent statue, to be placed in the Chapel of Henry VII., in the immediate vicinity of the grave in which the remains of the late Dean were so recently laid by the side of those of Lady Augusta Stanley.

LORD BYRON.—The Greek Government has at length undertaken the erection of a monument to Lord Byron, and has fixed upon Missolonghi as its site. The competition will probably be confined to national artists, though it is hinted by some that even this restriction may not prevent a repetition of the misunderstandings which have arisen concerning Mr. Bell's statue of Lord Byron which is now in Hyde Park, but which, it is said, runs a fair chance of being removed to some other less prominent site.

ST. ANNE'S-ON-SEA.—A reredos was unveiled on Sunday week in St. Anne's-on-Sea parish-church. It has been erected at a cost of £300, as a memorial to the late Mr. T. H. Clifton. It is built of Caen stone, and extends across the chancel, the design being a mingling of 13th and 15th centuries work. The central panel is occupied by a figure of the Good Shepherd, with sheep and lambs pressing towards Him; to the right is St. Peter kneeling before Christ, and to the left the Miraculous Draught of Fishes. The outer panels are a sheaf of wheat and a vine. Mr. Freeman, of Bolton and St. Anne's-on-Sea, designed the reredos, which has been carved by Mr. Earp, of Manchester.

STAINED GLASS.

NEWBURY.—The new window in the parish church, which has been provided from the funds of the St. Nicholas Stained-glass Window Society, has been filled in the south aisle of the parish church, by Messrs. Hardman and Co., of Birmingham. It consists of four lights and tracery. The glass has been treated in the Perpendicular style, to harmonise with the stonework in which it is set. The subjects chosen for illustration are taken from the Parables of our Lord. The tracery is filled partly with foliage on a coloured ground and partly by angels in white and gold, also on coloured ground, but with canopies and bases treated in the same way as that of the lights below.

KIDDERMINSTER.—A stained-glass window has been placed in the north transept of St. John's Church. It is a three-light window, and represents scenes in the life of Daniel, the Prophet. The design is one of the last century, and the base and canopy of each are surrounded by a border of ruby and pearly white. The window has been supplied by Mr. John Davies, Wyle Cop, Shrewsbury.

DEWSBURY.—**METCALF MEMORIAL.**—The large window in the south transept of St. Mark's Church has just been filled with stained-glass "in loving memory of the late Williamson Metcalfe, of Elmwood House, &c." There are four chief openings in the window. Each is divided into two compartments by bordures and panels of rich ornament, thus allowing the introduction of eight painted groups. In the upper range the subjects are—"Recovery of the Lost Sheep," "Prodigal Herding Swine," "Prodigal's Return," and "Recovery of the Lost Piece of Silver." Beneath are "Christ Raising the Daughter of Jairus," "The Wise and Foolish Virgins," and "The Raising of Lazarus." These are richly coloured, on a diapered ruby background very full in tone of colour. The intervening and inframing spaces of ornament are kept chiefly in white and dull blue, with here and there a little golden stain, so that each subject composition stands prominently forward, distinct in its own artistic integrity. The tracery-lights are rich in foliated ornament in white and light greens, worked on blue and ruby. The widow is the donor of the window, and Messrs. Powell Bros., Leeds, are the artists.

WATER SUPPLY AND SANITARY MATTERS.

MILTON WATERWORKS.—The works for the water supply of Milton-next-Sittingbourne have been completed, and were formally opened on the 27th inst. They have been carried out by Mr. Henry Robinson, C.E., of Westminster; the contractor being Mr. George Torkington.

PAISLEY.—A reservoir, for the supply of Paisley, which has been for two years in course of construction at Glenburn, near the summit of Gleniffer Braes, was formally brought into use on Monday. The embankment is half a mile long and 3ft. wide at top. It will afford three weeks' additional storage accommodation for the present population of the water-supply district, and has been constructed by Mr. Peter Quin, of Glasgow, whose contract was taken at £19,679. Messrs. J. and A. Leslie, of Edinburgh, were the engineers in chief, and Mr. Robert Sharp, the local master of works. The Paisley water commissioners have recently obtained Parliamentary powers to execute the Rye scheme, which is estimated to cost £100,000, and the first third of this sum will be expended within the ensuing year. The Glenburn reservoir just opened, together with the three previously existing reservoirs, affords a total storage for six months' supply.

CHIPS.

It is proposed to construct at once an experimental section, two miles in length, between Strete-gate and Torcross, of the intended South Hama Railway, which will ultimately be run from Laira-bridge, Plymouth, to Modbury, Kingsbridge, and Dartmouth, a length, with branches to Salcombe and Bigbury, of fifty miles. Mr. R. P. Brereton is the engineer, and Messrs. S. Lake and Son, who are now constructing the Milford Docks, the contractors.

New schools for 1,000 children are about to be built in Whitchurch-road, Crwys, for the Cardiff School-board. Mr. George E. Robinson, of Church-street, Cardiff, is the architect.

Mr. Ewan Christian is the architect of a convalescent home about to be built at Folkestone.

The new Public-hall at Devonport, erected from the designs of Mr. Samuel Knight, of London, is to be opened on the 9th November.

New offices are being built in Grosvenor-square, Manchester, for the Chorlton-cum-Medlock board of guardians. The architects are Messrs. Mangnall and Littlewoods, of Manchester.

Our Office Table.

THE sudden death is recorded of Mr. John Fraser, C.E., who for many years filled the position of engineer to the Great Northern Railway Company, on Saturday night last, at his residence, Grove House, Headingley. The deceased gentleman was 64 years of age. Mr. Fraser was the son of the late Mr. James Fraser, architect, Manchester, and was well known in local circles and also in other parts of the country by his connection with the Great Northern Railway. Mr. Fraser, who was the brother of Mr. J. B. Fraser, architect to the same railway company, has, during the last few years, assisted in the construction of several railways for that company. Amongst these may be mentioned the Bradford, Halifax, and Thornton line; the Castleford and Garforth line; the Bramley, Stanningley, and Pudsey line; several lines in Leicestershire near Melton, and including the Waltham branch; and the continuation of the Thornton line to Keighley, about half of which has now been finished.

THE extensive works which were contemplated for the permanent repair of Over-bridge, Gloucestershire, have, at any rate for the present, been abandoned on account of an unexpected difficulty. About fifteen months ago, Mr. Baker, C.E., was consulted as to the condition of this bridge, and reported that it was in a very critical state, pronouncing the opinion that theoretically the structure was a ruin. The eastern or Gloucester abutment had subsided, causing a thrust of the arch in that direction, resulting in fissures in the masonry. Mr. Baker could hold out no hope that the cracks and settlements would end unless the abutments were held up against the thrust of the arch by two brick struts, bedded firmly against heavy blocks of ironstone and concrete, built 120ft. back from the abutment, and he also advised the underpinning of the wing walls. The county magistrates accordingly entered a few months since into a contract for the execution of the works recommended by Mr. Baker. The preliminary examination of the abutment revealed the fact that it was 8ft. wider than it was stated to be in the drawings and records which Telford had left respecting the bridge. The wing walls were found to rest on a river deposit, but 3½ft. lower a fairly compact stratum was reached, on which thick beds of concrete were laid, underpinning the walls. A shaft was then sunk for the purpose of constructing one of the blocks of brickwork against which a strut was to be bedded, when a spring was tapped yielding a supply of 2,000 gallons per hour. The shaft, which was within 11ft. of the full depth, rapidly filled, and both Mr. Baker and the county surveyor declined to take the responsibility of pumping it out, lest the foundation of the abutment should be endangered, and the contract is accordingly stopped. At the same time there is less concern as to the stability of the bridge, partly because the abutment is so much wider and stronger than it was supposed to be, and partly because the wing walls have been securely underpinned. The cost already incurred has been under £1,000, less than one-fourth the total estimate.

THE docks which are being constructed near the entrance to Milford Haven, for the accommodation of American lines of fast steamships, have been inspected by representatives of the Dock Board. The masonry entrance of the graving dock and of the lock are among the greatest works of the kind in the kingdom, the whole of them being founded upon the solid rock, which, owing to the natural dip of the strata, is, in places, as much as 70ft. deep from the dock coping. The execution of such work in tidal water has been a stupendous operation, extending over a long period. The whole of this deep-water tidal work is, however, now complete, and the immense iron caisson, 100ft. long, is now in its place; the water is thus excluded from the dock area, and the remainder of the work will, therefore, be executed in the dry. This will enable an increased number of men to be employed, and to work continuously without tidal interruption. The size of the principal graving dock may be inferred from the fact that it has been executed around the Great Eastern, which was floated from it a few weeks ago.

A PARIS correspondent of the *St. James's*

Gazette writes:—It has been found necessary to remove the pinnacles from the tower of the chapel at Vincennes; and as they are very good specimens of the architecture of the 15th century, they have been removed to the grounds of the Cluny Museum, and will be carefully preserved. The Vincennes chapel, built by Francois I. and Henri II., is situated near the keep of the castle; and the stained-glass windows, painted by Jean Cousin, after drawings by Raphael, are considered to be the finest in Europe. The chapel was restored in 1840, and in one of the transepts is the tomb of the Duc d'Enghien, executed by Desorme. The murdered Prince is represented leaning upon Religion, and supported by Innocence, with his eyes raised heavenwards, and his right hand indicating the spot where he wishes to be struck; while Crime, as represented by a man with a dagger, rushes forward against him. Upon the other side of the main group, France, in the attitude of a grief-stricken woman held captive, holds a broken sceptre in one hand and strains to come to the relief of the Prince. The chapel also possesses the font which was for a long time used at the baptism of children of the French Royal family, and which was taken to Fontainebleau for the baptism of Louis XIII. This font, which is said to be nearly a thousand years old, is made of red copper; but it is so covered with embossed silver plates, representing various personages of note who have had to do with the Royal baptisms, that one can scarcely see the copper.

SOME interesting experiments were made on Friday last at the well-known glassworks of Messrs. Chance Brothers and Company, Smethwick, near Birmingham, with a new lamp, which they have just constructed to crown the summit of the South Head Lighthouse, Macquarie Harbour, Sydney, New South Wales. It is called a first order, dioptric, revolving light, with the electric arc. The lamp has a special arrangement of prisms for securing vertical divergence of the beam. It is over 6ft. in diameter, and the height is about 9ft., and it is said to be the first time such dimensions have been applied to illumination by the electric arc. The lamp or regulator has a power of about 12,000 candles in the focus of light, and the merging beam has a luminous intensity exceeding 12,000,000 candles. The light will give flashes around half the horizon at intervals of a minute, and will make a complete revolution every 16 minutes. On an average the light will be visible at a distance of 40 or 50 miles. The lamp was designed for Messrs. Chance by Dr. Hopkinson, F.R.S., and is constructed for the Government of New South Wales. Its makers claim that it will be the largest and most powerful light in the world. The experiments were thoroughly successful, the light being so intense that it could hardly be endured with the naked eye.

A RETURN has been issued in the form of a Blue-book, in pursuance of an order of the House of Commons, "of an abstract of the accounts furnished by building societies incorporated to the 31st of December, 1880, under the Building Societies Acts, in pursuance of the Act 37 and 38 Vict., c. 42, s. 40." The total number of the societies in England and Wales is 1,267. Of these 23 had been dissolved and 21 were in default. The number of members was 372,035, and the amount of the receipts in the year was £18,694,555. In all 1,111 societies made return of their liabilities and assets. The liabilities were to holders of shares £21,813,095, to depositors and other creditors £14,079,762. The amount of the balance of unappropriated profit was £1,104,735. The balance deficit reached £47,209 for 167 societies. The assets were represented by a balance of £34,847,320 due on mortgage security and £2,103,063 invested in other securities and cash.

ARCHDEACON DENISON has circulated amongst his villagers at Brent Knoll, in Somerset, a paper setting forth the extent to which he has, after unceasing efforts, during the last quarter of a century, supplied the district with water. Finding that epidemic disease prevailed for want of water, he dug for wells, and has now ten reservoirs, four springs, and eight dams with fountains, filter-beds, tanks, and pumps. The drinking-water is supplied through galvanised pipe directly from the springs. The six lower reservoirs are fishpools, pools for swans and ducks, and drinking-places for cattle. The Archdeacon has spent £1,500 on the works, and he now calls upon the people to take up the

matter and continue what he has successfully commenced.

THE *Stercity* describes a piece of sculpture modelled by the Rev. F. Knill Harford, Minor Canon of Westminster, consisting of one of a pair of angels, each holding a cresset for containing a brilliant light, and intended to be placed on pedestals, in advance and on either side of the high altar of some great church. The scale is life-size. The cressets were intended for a group of gas-jets; but wires have been placed in the models with a view to the possible use of electric light. "The idea of a soft light, like that of the moon, ever burning before the altar, seems," the *Stercity* observes, "at all events to be one of poetry and beauty." The soft light of the moon seems more and more to affect the brains of alchemists and advocates of ritual and ceremonies unknown to the English Church.

A COMPANION has just been discovered, according to the *Daily News*, to the chief monument of Rome's regal period, the Cloaca Maxima. This drain starts from the Piazza Paganica, and passing under the Ghetto or Roman Jewry, discharges into the Tiber, opposite the island of San Bartolomeo. It is built of blocks of Gabii stone. The walls, 1.80 metres high, are formed of blocks, each 0.90 metre high, 0.70 metre deep, and 2.50 metres long. The vault consists of five wedges, fitted together without cement. The bottom is paved. In several points restorations are visible, dating apparently from the 16th or 17th century.

THE committee appointed to examine the application for the appointment of borough engineer and surveyor for Leeds, in the stead of the late Mr. A. W. Morant, reported to the council that in answer to the advertisement 80 applications had been received, and the committee, after carefully examining the same, recommended the council to make the appointment from the following six applicants:—Mr. Garrett J. Barry, engineer and surveyor, Liverpool; Mr. Joshua Cartwright, borough engineer, Bury; Mr. Thomas Hewson, borough surveyor, Rochdale; Mr. James A. Jowett, district engineer and surveyor, Manchester; Mr. R. L. Mestayer, deputy borough engineer, Salford; and Mr. William J. Morley, architect and surveyor, Bradford. The several applications were read, and each candidate was called into the room and questioned as to his experience and standing in the profession, after which some discussion took place. The voting then took place as follows, the candidate receiving the lowest number of votes being struck out after each vote:—First vote—Barry, 25; Cartwright, 20; Hewson, 23; Jowett, 29; Mestayer, 23; Morley, 17. Second vote—Barry, 22; Cartwright, 17; Hewson, 23; Jowett, 20; Mestayer, 18. Third vote—Barry, 20; Hewson, 24; Jowett, 18; Mestayer, 19. Fourth vote—Barry, 23; Hewson, 27; Mestayer, 22. Final vote—Barry, 23; Hewson, 26. Mr. Hewson was, therefore, appointed, and the council confirmed the appointment by a unanimous vote.

THE village of Ryton-on-Tyne has just received a valuable acquisition in the shape of a large clock, which has been erected in the tower of the parish-church, in memory of the late William Webb, M.A., who was for fifteen years the rector of the parish. The work was entrusted to Messrs. W. Potts and Sons, of Leeds. Though, of course, smaller, it is similar in construction to the great clock in the Houses of Parliament, at Westminster, designed by Sir Edmund Beckett, Bart., Q.C., and similar in principle to the magnificent clock recently erected by the above firm at Lincoln Cathedral. The clock-frame is made of solid cast iron, on the horizontal plan, the top surface of which is planed; this rests upon cast-iron brackets, which are firmly bolted to the wall of the tower—a firm foundation for a clock of this description being very important. The escapement is what is technically known as the double three-legged gravity, the invention of Sir E. Beckett, an arrangement which insures, with absolute certainty, a uniform impulse to the pendulum, and prevents the going parts of the clock being affected by extraneous influences, such as wind on the outside hands, winding, &c. The pendulum, on which so much depends, is what is known as a "compensated pendulum," being ingeniously constructed of zinc and iron tubes in such a manner that variations of temperature

do not affect the length of the pendulum, which is thus to vibrate in exactly the same time in all weathers and is entirely uninfluenced by heat or cold. The pendulum, which weighs two hundredweight, vibrates in one and a quarter seconds. As the church of Ryton is so situated as to render the dial, in whatever place it may be fixed, difficult to see, it was considered essential that the greatest accuracy should be obtained in the striking parts of the clock, and in order to render it as useful as possible, it was determined that it should chime at each of the four quarters as well as strike at the hour; and a strong desire being expressed that the chimes should be similar to St. Mary's, Cambridge, it became necessary to have a new bell, there being originally only three bells in the tower.

AMONG their forthcoming works, Messrs. Crosby Lockwood and Co. announce the following, which are likely to interest our readers.—"Tramways, their Construction and Working, with Special Reference to the Tramways of the United Kingdom," by D. Kinnear Clark, M.Inst.C.E., Supplementary Volume. "Tables, Memoranda, and Calculated Results, for Mechanics, Engineers, Architects, Builders, Surveyors, and others," selected and arranged by Francis Smith. "The Science of Building, an Elementary Treatise on the Principles of Construction, especially adapted to the Requirements of Architectural Students," by E. Wyndham Tarn, M.A., architect, second edition. "Practical Geometry for the Architect, Engineer, Surveyor, and Mechanic, giving Rules for the Delineation and Application of various Geometrical Lines, Figures, and Curves," by E. Wyndham Tarn, M.A., architect, second edition. "Lockwood and Co.'s Builder's and Contractor's Price Book for 1882, containing the latest Prices of all kinds of Builder's Materials and Labour, and of all Trades connected with Building, &c.," the whole revised and edited by F. T. W. Miller, A.R.I.B.A. Also, among new volumes and new editions in Weale's "Rudimentary Scientific Series":—"Foundations and Concrete Work," by Edward Dobson, M.R.I.B.A. (fifth edition).

CHIPS.

It is stated that, owing to the protests raised against the proposed desecration of St. Leonard's Priory, Stamford, the scheme for turning that beautiful example of Transitional work into a cart-hovel has been abandoned. The Rev. G. F. Crowther, M.A., of Market Harborough, writes, however, to say that the other day the Priory was being used as a stable, the interior being fitted up with stalls for horses.

The *Port Elizabeth Telegraph* of the 26th ult. reports the death, by his own hand, of Mr. John Hamilton Wicksteed, C.E., resident engineer of the Van Stadden's River water scheme, and engineer to the Town Council of Algoa Bay.

At the Norwich Consistorial church, last week, a faculty was granted for transferring the mural tablets and monuments and memorial window from the old church at Thorpe, next Norwich, to the new one, to take down the chancel and vestry, remove all fittings, including pulpit, gallery, and pews, from the old building, of which part of the walls and the tower will be allowed to stand as a "ruin."

The Devonshire hospital at Buxton is to be opened by Earl Derby on Tuesday, the 11th October.

The will of Mr. Frederic Ouvry, F.S.A., for many years hon. solicitor to the Royal Institute of British Architects and a life trustee of the Soane Museum, who died on June 26th last, has been proved, the personal estate amounting to upwards of £15,000.

An inquiry was held at the Council House, Birmingham, on Friday, before Mr. J. Thornhill Harrison, C.E., one of the inspectors of the Local Government Board, with reference to an application from the town council for sanction to borrow £127,000 for works of sewerage and street improvements, public baths, and fire-brigade purposes. No opposition was shown to the proposal.

A meeting was held at Weston-super-Mare on Friday with reference to a scheme for constructing a pier from the west end of Regent-street. Messrs. Munroe and Son, of Bristol, exhibited the plans, and stated that they represented a pier of cast and wrought iron 25ft. wide, the approximate cost being £10,000. Mr. Secones, of Bristol, said his estimate of the cost of pier, together with a tramway from the new railway-station, was £28,225.

The partnership between Messrs. Botham and Goodrich, of Brighton, architects and surveyors, has been dissolved.

The foundation-stone of the new hospital in Mills-road, Lowestoft, was laid by Sir Savile Crossley on Friday. Mr. J. L. Clemence, of Lowestoft, is the architect, and Mr. Arthur Bedwell the contractor.

The town council of Swansea have received a warning from the borough surveyor, Mr. E. Cousins, that no further weight should be placed in the upper floors of the free library buildings, as the walls show signs of bulging, and, in consequence, an order has been issued that no more than twelve persons be admitted to the art gallery at one time. The library premises consist of a series of metamorphosed houses in Goat-lane, and their threatening condition indicates that the proposed erection of suitable buildings in a central position for housing the school of art, free library, and fine-art collection, cannot much longer be postponed.

South Wootton Church, near King's Lynn, was struck by lightning on Sunday week; the tower at west end was split nearly to the ground; the timber roofs and seats, both in nave and chancel, greatly damaged, and the east window partially destroyed.

St. Paul's Church, Glws, near Llanshamlet, was opened for service last week. It is built of local stone with freestone dressings, and is Gothic in style. It measures 74ft. by 20ft., internal dimensions without apsidal chancel, and is seated with pitch-pine benches for 250 persons. Mr. H. F. Clarke, of Briton Ferry, was the architect.

The Local Government Board have sanctioned a loan of £3,000 for the purpose of erecting a sanatorium at Torquay. Mr. Ernest Turner, of Regent-street, London, is the architect.

A new mission church has been opened at Sunderland. Mr. Martin Greener was the architect.

The interior of Holy Trinity Church, Leamington, has just been considerably improved by the addition of a very handsome carved Caen-stone pulpit with marble shafts and elaborate oak choir-stalls. Brass gas standard and lectern, together with an embroidered altar frontal, have also been added. The whole of the work has been executed by Messrs. Jones and Willis, of Birmingham and London.

A fine-art exhibition has been opened this week at Leicester. It contains 256 pictures, the larger proportion being oil-paintings.

At a dinner held on Friday in connection with the fine-art exhibition at Cardiff, Sir E. J. Reed, M.P., presented the town with Vient Cole's "Noon: a Scene on the Surrey Hills," a picture valued at a thousand guineas, and which the donor remarked was the best in his collection. "Noon" was one of the features of the Academy Exhibition of 1873.

The annual distribution of prizes and certificates to the students of the classes at Chilworth, Surrey, took place on Wednesday week. The report was of a satisfactory character, except with regard to the elementary art class work.

Memorial windows have just been placed in St. Andrew's Church, Old Kent-road, Newington, S.E., and Christ Church, Mitcham, to Mrs. Ann Nobes. The work in both cases has been carried out by Mr. Charles Evans, of Fleet-street, E.C.; the Mitcham window, which was unveiled last week, contains a figure of "Charity" distributing gifts to the poor.

A new coffee-tavern was opened at Taunton on Tuesday. It has been erected, at a cost of £3,300, by Mr. Templeman, builder, from plans prepared by Mr. C. H. Samson. On the ground-floor are bar and buffet, kitchen, offices, &c., and on the upper floors ladies' clubrooms, commercial rooms, bath-rooms, and twelve bedrooms.

At Soham, Cambs, on Tuesday week, new Congregational Sunday-school buildings were opened. They adjoin the chapel, and have been erected at a cost of £500 by Messrs. Johnson, builders, of Soham.

The foundation-stone was laid on Monday last of a new school and classrooms for, and attached to, the Plymouth Brethren Chapel, at Yeovil, Somersetshire, from plans by Mr. Fred. Cox, of Yeovil, surveyor, who is also the contractor for the erection. The cost, exclusive of the old materials on the site, is £350.

Mr. Thomas Eva, borough surveyor of Helston, died on Thursday, the 15th inst., from the effects of a fall of 8ft. from a plank while inspecting building operations. The deceased, who was 78 years of age, had executed many important works in Cornwall as a builder, including the lighthouses on Godrevy and the Lizard; the Gyllys monument at Helston, and the Gilbert obelisk at Bodmin; Boscawen Bridge, at Truro; and a large number of houses at Helston and elsewhere.

Star-street Congregational Chapel, Cardiff, was reopened on Sunday week, after renovation, the lowering of pulpit and erection of new organ, the latter being built by Messrs. Isaac Cool and Sons, Bristol.

Dr. Alexander Carte, who had held the appointment of Director of the Natural History Museum of the Royal Dublin Society since 1851, in which he had effected great improvements in arrangement, has recently died and was buried with some public ceremony on Tuesday. From 1844 to 1851 Dr. Carte was Curator of the Royal College of Surgeons in Ireland.

An important railway-contract arbitration case was opened on Tuesday morning at Macgregor's hotel, St. Vincent-street, Glasgow, in which Mr. John Mackay, contractor, Wishaw, and the Caledonian Railway Company are the interested parties. The question has arisen in connection with the contract for the formation of the Wishaw line, under the Caledonian Railway Additional Powers Acts, 1873 and 1874, and is to decide what may be considered "extras." The contractor claims various sums, amounting in all to £171,246 6s. 7d., and after crediting £102,270, there is still a balance due which with interest amounts to £42,967 13s. Mr. John Strain, C.E., of Glasgow, is the arbitrator.

A Dundee journal states that, in the importation of timber, sailing-vessels, to which the traffic has hitherto been exclusively confined, are being superseded by steamers, and that there is a growing preference in the trade for deals over log timber. It is mentioned that a steam-vessel from the Baltic is now discharging, at Dundee, a cargo of over 20,000 deals for Messrs. Bell and Sime, saw-mill proprietors. A sailing-vessel from Quebec is unloading, for the same firm, 10,000 pine deals; and three other vessels are discharging, also for Messrs. Bell and Sime, 3,000 pieces.

The school-board of Beeston, Notts, have, this week, adopted plans, prepared by Mr. Bromley, for a school for 500 children.

A Masonic lodge is about to be built at Fowey from the plans and designs of Mr. R. S. Clunes, architect, of that town.

The Sheerness local board of health decided, last week, to reduce the salary of their surveyor from £120 to £110 a year.

The Plymouth school of art has just reopened, under Mr. Babb, for its 31st session in more commodious premises in York-street.

The reredos at St. Andrew's Church, Montpelier, was unveiled on Sunday, after having been decorated with paintings of the Twelve Apostles. The figures, which are painted two in a panel, are nearly full size; round the head of each is a golden nimbus, but the dresses are kept in neutral colours. In the centre is the Agnus Dei. The decoration is the work of an amateur, Captain J. H. Butt, R.N.

A memorial-window has been placed in the parish-church of St. Andrew, Shoeburyness, to the late Major Lambert, R.E. It is filled with subjects from the "Pilgrim's Progress" of Bunyan, and is intended to represent the Christian's path through life. It has been executed by Messrs. Cox, Buckley, and Co., of Southampton-street, Strand, W.C.

A new police-station and court-house are about to be built at Bamber-bridge, near Preston, Lancashire, for the Walton-le-Dale district, from the plans of Mr. Thomas Nevett, architect, Winckley-street, Preston.

A block of industrial dwellings has just been erected for Sir Edward Bates in St. Andrew's-street and Lower-lane, Plymouth. The block is of three stories, and is entered from a central open courtyard, approached through a covered archway. On each floor it is planned as two tenements of three rooms and two others of two rooms each, the upper floors being reached by flights of York stone steps. All living-rooms are 12ft. by 12ft. 6in., and bedrooms 12ft. by 9ft., and the uniform height of a room is 10ft. The internal walls are faced with Portland cement. The floors are carried by girders, and neither laths nor slates are used in construction. The Lambeth "flush-out" closets are adopted. Mr. Pethick, of Plymouth, is the builder, and will proceed now to erect for the same proprietor a second block of dwellings in Victoria-street and Victoria-lane.

Rodney Stoke Church, Somerset, was reopened after restoration on Wednesday.

Mr. Bottomley was on Monday appointed surveyor to the local board of Saltburn-on-Sea, at a salary of £60 per annum.

New school and classrooms, erected at the rear of the Wesleyan chapel in Wilton-road, Salisbury, were opened on Wednesday week. There are five classrooms, and above these a meeting-hall, 50ft. by 25ft. The architect was Mr. Hudson, of Gillingham, and the builder, Mr. E. Witt; the cost has been £650.

The Prince of Wales is expected to inaugurate the new sea-wall and promenade on the Seabrook Estate between Hythe and Sandgate, and also to lay the foundation-stone of the new harbour-works now in course of construction at Folkestone, on Wednesday week, the 12th prox.

A new Wesleyan chapel is about to be erected at Forrest, near Camborne. Mr. James Hicks, of Redruth, is the architect.

A two-light stained-glass window was last week placed in the chapel on south side of chancel in St. Mary's Church, Chelmsford. It represents the Feeding of the Hungry and the Visiting of the Sick, and has been carried out by Messrs. Clayton and Bell, of London.

Three pairs of polished brass plates have just been placed in St. Mary's Cathedral, Aberdeen, one pair in the centre, and one pair on either side, for the chapels of St. John and Patrick. The designs are Early English, and were executed by Jones and Willis, of Birmingham and London.

Mr. Alderman Ellis, who will be the new Lord Mayor of London, is an auctioneer, and is of the firm of Farebrother, Ellis, Clark, and Co.

The engineers engaged on the tunnel being constructed by the Great Western Railway under the Severn—a distance of two miles—to connect the Gloucestershire and Monmouthshire sides of the river, have effected communication, and thus united the headings driven from opposite sides. The lines were laid so accurately that the centre was struck within three inches.

Throat Irritation.—Soreness and dryness, tickling and irritation, inducing cough and affecting the voice. For these symptoms use Epps's Glycerine Jububes. Glycerine, in these agreeable confections, being in proximity to the glands at the moment they are excited by the act of sucking, becomes actively healing. Sold only in boxes, 7½d. and 1½d. labelled "JAMES EPPS and Co., Homoeopathic Chemists, London." A letter received:—"Gentlemen,—It may, perhaps, interest you to know that, after an extended trial, I have found your Glycerine Jububes of considerable benefit (with or without medical treatment) in almost all forms of throat disease. They soften and clear the voice—Yours faithfully, GEORGE HOLMES, L.R.C.P.E., Senior Physician to the Municipal Throat and Ear Infirmary."

Trade News.

WAGES MOVEMENT.

Farnices, Landport ... 101 0 0

LONDON.—For new warehouse, Lower Thames-street, E.C. Mr. E. N. Clifton, architect:—
Macey ... 25,324 0 0
Cooke and Co. ... 24,982 0 0
Morter ... 23,343 0 0
Lawrence ... 22,855 0 0
Ashby and Horner ... 22,530 0 0
Conder ... 22,490 0 0
Holland and Hansen ... 22,288 0 0
Peto Bros. ... 22,151 0 0
Brass ... 21,987 0 0

LEICESTER.—For brick channel, for the New Walk, Leicester. Mr. J. Gordon, M.I.C.E., borough surveyor:—
Major, F. ... 137 10 0
Clarke and Garrett ... 119 15 0
Jewsbury, J. ... 117 18 0
Hewitt, H. M. ... 113 10 0
Duxbury, T. and Son (accepted) ... 110 0 0

LEICESTER.—For supply of manhole covers, ventilating grates, &c., to the Highway and Sewerage Committee. Mr. J. Gordon, M.I.C.E., surveyor:—
Goodwin and Barby, Leicester ... 570 0 6
Hill and Smith, Brierley Hill, Staffordshire ... 543 17 4
Harrold, J. T., Leicester ... 522 6 4
Smith, Patterson and Co., Blaydon-on-Tyne ... 449 3 0
Stableford and Co., Coalville, Leicester ... 431 5 2
Jukes, Conkson and Co., London ... 365 7 3
Cort and Payne, Leicester ... 306 16 6
A. Delivered at Leicester Station. B. Delivered at Friday-street or Jarvis-street yards.

LEYTONSTONE (ESSEX).—For the erection of house at Leytonstone, for Mr. R. Tomlin. Mr. Henry Poston, Earham-grove, Forest Gate, E., architect:—
Hosking, G., Forest Gate ... 1887 0 0
North Bros., Stratford ... 818 0 0
Donaldson, Leytonstone ... 732 0 0
Jackson and Todd, Hackney-road ... 720 0 0
Accepted.

LLANELLY.—For laying pipes, for the town council:—
Jones, S. (accepted) ... 11,225 17 3
[At the previous meeting, the tender of Trayne and Co., of Birmingham, was accepted for same work at £865 17s. 6d.; but they afterwards wrote, amending their offer to £1,115, on account of error.]

MAIDSTONE.—For erection of stable for twenty horses at the Star Hotel, Maidstone. Mr. G. Friend, Maidstone, architect:—
Vaughan, Maidstone ... 11,922 0 0
Calland and Son, Rochester ... 1,080 0 0
Naylor and Son, Rochester ... 1,070 0 0
Walls and Clements, Maidstone ... 1,019 0 0
Wood, Boughton Monchelsea ... 818 10 0
Accepted.

MILTON-NEXT-SITTINGBOURNE.—For supply of 200 tons of broken Guernsey granite, at per ton, delivered in Milton, for the Improvement Commissioners. Mr. H. W. Clarke, surveyor:—
Chittenden, Knight and Co., Sittingbourne ... 20 12 6
Gabriel, London ... 0 12 0
Manuelle, London (accepted) ... 0 11 8

MOUNTAIN ASH (S. WALES).—For making up Penrhin-aceiber-road, for the local board of Mountain Ash:—
Williams and Lewis, Cardiff ... 11,936 6 9
Mackay, J., Treforest ... 1,862 1 2
Jenkins, C. and Son, Treherbert ... 1,855 18 6
West, J. and Son, Ebbw Vale ... 1,414 9 2
Williams & Jenkins, Pontypriid ... 1,283 16 9 1/2
Taylor, T. T., Mountain Ash ... 1,162 5 4
[Surveyor's estimate, £1,086 3s.] Accepted.

NEWTON-IN-MAKERFIELD (LANCS).—For construction of 850 yards of pipe sewers, for the Newton-in-Makerfield Improvement Commissioners. Mr. R. Brierley, engineer, Town Hall, Newton-le-Willows:—
Prescott, E., Wigan ... 2933 4 11
Pemberton and Kendrick, Newton ... 777 4 5
Adams, N. T., Ashton ... 750 2 10
Cowborn, S., Hindley ... 711 14 0
Thompson, Whittle & Sticher, Orrell ... 692 6 6
Winnard, W., Wigan ... 586 0 0
Fawkes Bros., Birkdale ... 552 6 3
Heaton, R., Warrington ... 500 0 0
Unsworth, J., Newton (accepted) ... 417 0 0

THE BUILDING NEWS.

LONDON, FRIDAY, OCTOBER 7, 1881.

LIGHT AND AIR IN THE CITY.

THE increasing demands made upon already overcrowded parts of the City, especially in the erection of lofty warehouses and blocks of chambers, daily call for the exercise of ingenuity and contrivance on the part of the architect. A site in a street, surrounded on three sides by houses, is cleared by the pulling down of old and comparatively low buildings, and a lofty factory or commercial house is erected thereon. "Ancient lights" abut on the vacant site, and the new structure has to be built to avoid the consequences of an action for damages for obstructing light. The new buildings generally occupy a larger area than the original houses, but the principal thing to be considered is the increased height necessary to be attained to give the accommodation required. With the most careful planning it is almost impossible to avoid impeding or obstructing the access of light to surrounding buildings which, before the pulling down of the old premises, had a court or open space of garden-ground in rear of them. The new buildings have almost of necessity a greater height as well as increased area, and, in short, encroachment seems to be almost the necessary accompaniment of rebuilding; the most careful contrivance of areas in the plan often fails to mitigate the grievance, and the light and air question, whether viewed as a legal complication, or as one of the greatest physical difficulties with which the architect has to deal, seems to grow in urgency every day. People must have light and air, and it seems to be a point for the intervention of the Board of Works, or some other recognised authority, to define more than they now do, the height and limits of depth of building in the metropolis, no less than they impose other rules for the keeping of a regular line of frontage in streets.

There is a section in the Metropolitan Building Act (18 and 19 Vict., 122) which provides that every building used or intended to be used as a dwelling-house, unless all the rooms can be lighted and ventilated from an adjoining street or alley, shall have in the rear or the side thereof an open space of the extent of at least 100 sq. ft. In other words, an area of about 10ft. square is required to be provided in the rear of every building used as a dwelling, irrespective of the height of the buildings, so that, in point of fact, the higher the houses adjoining the less the quantity of light admitted. It will be seen, therefore, that notwithstanding the rules about areas, the demand for lofty buildings is practically leading to a new difficulty which has to be grappled with. How to evade an action for infringing on the rights of adjoining owner is becoming more and more difficult as loftier and more commodious premises are required.

The practice of top-lighting shops, warehouses, and counting-houses, now commonly adopted, to a certain extent, reduces the difficulty; but top-lights are not practicable in all cases, and on hygienic grounds we have some doubt whether such lighting is so desirable for rooms occupied by a number of clerks or working people during the year, as side windows. There is a question among scientific men whether rooms lighted down narrow shafts or courts are not destroying the eyesight of those who have to sit in them, and even metallic reflectors have been objected to as injurious to vision. On this purely sanitary side of the question much might be urged in favour

of good areas in the rear as well as wide streets in front of buildings, and when we couple air with light, the evidence seems overwhelming for the old-fashioned mode of lighting by side windows. The subject from this physical point is one upon which much might be said; but the architect has enough to do, and will earn the lasting gratitude of city workers if he can by mechanical means contrive to preserve side windows wherever he can do so.

There was an ancient custom in London by which it was allowed to rebuild any house upon the old foundation, and to any height at pleasure of the owner, although by rebuilding on ancient foundations, the lights of his neighbours were stopped up. This custom was abolished by the Prescription Act, which materially affected the value of building land in the metropolis, for it operated to prevent the erection of lofty buildings. The judgment of Lord Cranworth, in "*Yates v. Jack*," and other early decisions, show the opposition the statute met with from those who desired to raise buildings. Yet there was a clear wrong in permitting the owner of a house in a narrow street to raise it to any height he thought fit; for only those who possessed a written agreement by which light was enjoyed were secure against encroachment. The objection entertained by Lord Cranworth to the Act which abrogated the old custom in the City, was based on the convenience of City landlords and wealthy capitalists, who did not scruple to diminish the light and air of their neighbours by erecting huge warehouses, in which were packed a crowd of workmen or clerks; nevertheless the new statute was a great gain to the inhabitants of London.

But the Prescription Act, while it certainly abolished the oppressive tyranny of capitalists and landlords, has little benefitted those whose enjoyment of light has been of less duration than the prescriptive period of 20 years. In several instances we may see buildings which occupy more land, built twice the height of the old premises, and, further, the use of windows, if not consecrated by the period prescribed, confers no right in a lateral direction. It is very true that a neighbour can obstruct (by hoarding, or by building a wall,) the light through any windows opened against him, or which overlook his property, at any time during 20 years after the building has been erected, so as to prevent the acquisition of an easement; but the new building obstructs the admission of the light, and both builder and adjoining neighbour are the sufferers. In innumerable instances, therefore, the Act is powerless to prevent obstruction of light and air, while the Metropolitan Building Act only requires the owner who rebuilds a party-wall to make good all damage occasioned thereby to the adjoining premises. There is nothing in the latter to take away the common law right of any individual to bring an action against the building owner for obstructing an ancient window. The Building Act does not sanction the insertion of fresh windows into party-walls, nor any encroachment on existing rights; but it appears powerless to stop the growth of lofty buildings which materially darken or obstruct the free access of light to the windows of the surrounding houses. A very common case occurs when two properties are contiguous to each other, and one of the owners erects a workshop or other building fronting the other's land. The division wall is afterwards condemned, and the owners at their joint expense erect a new party-wall, half on each land; the old window is reinstated, and the adjoining owner bricks it up on his side or builds a wall on his half of the fence so as to obstruct the window. An action is brought by the building owner, and the issue will depend on the right or easement he possessed, and

the amount of diminution of light. In fact, the principle has been confirmed by several cases, as in "*Wells v. Ody*," "*Crofts v. Haldane*," &c. It is necessary to show a right to the access of light, either for the 20 years prescribed by the Act, by common law, by consent or agreement, by the disposition of the owners, or by some other act; if this cannot be done there is no substantial relief for the aggrieved neighbours. These remarks apply chiefly to the erection of new premises with or without overlooking windows, by which the adjoining houses suffer a deprivation of light which their owners have no legal or acquired right to enjoy.

We may here briefly remind the reader of the law on the prevention of the right to light. This may be by the owner of the servient tenement raising a hoarding or wall so as to obstruct the light before it has been enjoyed by the dominant tenement for 20 years; but there is one exception pointed out by Mr. Roscoe in his useful digest. A., the owner of a house which has ancient lights, raises the roof and upper part of the window-frames, thus enlarging his windows. B. has no right to obstruct them, even although A. is thereby the gainer of additional light. It is also competent for the owner of an ancient light to alter it by making it horizontal, according to the ruling in the "*Natl. Prov. Plate-Glass Co. v. The Prudential Insurance Co.*" Another moot point about which lawyers and surveyors differ is as to the extent of the right to light. It is clear that a servient tenement owner cannot by any erection or alteration appreciably darken any room in the dominant owner's house; but the degree of obscuration, rendering a room or workshop substantially less useful or comfortable, is not so easily determined, and we may quote here a note from Mr. Roscoe's little book which may throw a little light on a rather vexed point.

"It may be pointed out that the impression founded on the words of sect. 85 of the Metrop. Amendment Act, 1862, and sustained by some cases, such as that of '*Beadel v. Perry*,' that the existence of 45° of light from the zenith is a test of the sufficiency of the amount of light, has now proved to be wrong. Such an amount of light may be some evidence as to the probability of a serious obstruction, but beyond that has no effect." Of course the burning of gas during the day may become useful evidence, and it is pointed out, stronger evidence is required if the obstruction is lateral than if it is direct. The actual subtraction of sky area, measured horizontally as well as vertically, by a new erection is the chief point in the quantitative view of the matter, and there are methods we have before pointed out in these pages for measuring the angles in both directions. The Building Act rule, which required the height of a building not to exceed breadth of street is a wholesome one, but does not always apply, while the amendment to the Act, 1878, which prescribes a distance for the walls of buildings from the centre of roadway, useful as it is, does not touch the evil. A more specific rule with regard to the height of new buildings on sites in thickly inhabited parts of the City is required, one which will apply to such cases as we have referred to, or to buildings over which the existing Acts have no control, or very imperfectly protect the rights to light and air not acquired by law. The architect's difficulties would be considerably lessened if there was a rule in force to limit the encroachment of new buildings on old sites, and to restrict their height, so that properties in the rear or at the side would not have to resort to litigation every time access of light to a window was threatened. As regards the practice of building lofty areas for light and air in the rear of pre-

mises, we can only say it is prejudicial to the healthful occupation of the larger warehouses and places of business in crowded streets, and we cannot avoid the reflection upon the probable effects in the future of this overcrowding in some the more congested localities in our cities.

CHLARING - CROSS HOSPITAL NEW MEDICAL SCHOOL.

LAST Monday afternoon the new medical school in connection with Charing-cross Hospital was opened with a conversazione. The school is built on a leasehold site granted by the Duke of Bedford, on the north side of Chandos-street, and has a frontage of 35ft., and a depth of nearly 100ft. On the east side the building is skirted by a narrow court known as Bedford-court; and the lighting has been mainly obtained by windows on this side. The ground-plan forms a long parallelogram with a slight projection on the west side in the rear, and comprises a spacious vestibule with officers' rooms on the right-hand side, a square staircase of stone, a library and librarian's room, and a long cross apartment at the end to be used as a museum, 41ft. by 21ft., and 18ft. high. There is a shallow gallery on each side approached by steps, and the room is fitted with cases of pitch-pine, and is well lighted by windows at each end, the main ones forming the gable end towards the court. Attached to the museum is a curator's room. The library is another spacious apartment, near the staircase, lighted from the court, and in communication with a librarian's room. It is approached from the main vestibule. The staircase is central, 20ft. by 18ft. square, with spacious straight flights of stone, lighted by a lantern at the top.

Ascending the first flight, we observe a similar division. In the front, well lighted by large sash-windows and casements above, fitted with Elsley's patent fasteners, is a physiological laboratory 33ft. by 21ft., and intended for microscopic work; the other rooms are devoted to a chemical theatre in connection with a chemical laboratory and a classroom 24ft. square; and a theatre for 170 students, with large and lofty windows, the centre one being carried up above the ceiling, is also obtained on this floor. The windows have sashes below and casements above; the lecture-table is placed below these windows, so that direct light is insured; and the seats are arranged tier above tier in nine rows, curved in plan. The doorways from gallery are arranged to lead from the stairs-landings. The second floor has a post-mortem theatre, 21ft. square, arranged, in front, with ample lavatory accommodation on one side, an upper theatre for anatomical purposes, 33ft. by 27ft., over the lower theatre, and a dissecting-room, 41ft. by 24ft., in the rear. These rooms are all admirably lighted by top lights, and are ventilated by pivoted frames in the skylights. The post-mortem theatre has a lantern-light along the ridge of roof, and forms the front gabled portion of the facade; the principals are queen-post, boarded between, below the skylight, the upright lights of which are actuated by Elsley's patent balance levers. The dissecting-room, which is behind (over the museum and laboratory), is lighted also from the roof by a long lantern, or ridge-light, with side ventilators; wrought-iron principals with elliptic ribs carry the purlins, the spaces below the lights being boarded and painted. The floor is paved with red and black tiles, and the heating arrangements consist of "hydro-caloric" coil cases at both ends, supplied by Messrs. Weeks, of Chelsea, on their new principle, admitting fresh warmed air.

The construction and details of the building have been arranged with strict reference to the use of the students. There

is a lift which serves each floor to convey subjects for dissection to the upper rooms, and is in connection with a subway, which connects the hospital with the basement of the new schools under Chandos-street; the walls are generally plastered with Parian cement, to prevent absorption, and are painted with suitable shades of colour; and the floors of the dissecting-room, post-mortem room, laboratory, and corridors are tiled with red and black tiles. The dados and woodwork are dark chocolate and green. The basement, used for stores and housekeeper's room, &c., is well lighted, and we find Hayward's prismatic lights have been introduced with much effect. Kaye's percussive locks have been used. In the roofs, lead flats have been adopted, to avoid encroachment on adjoining rights of light and air. We learn that Mr. Courtney (Messrs. Barkers) have generously foregone their rights in this respect, enabling the architect to avail himself of better lighting than otherwise possible. We have already mentioned that the system of warming is by Weeks' hydro-caloric coils. These, as our readers may remember, have a decided advantage over the ordinary coil in which the pipes are placed horizontally, and the fresh air, instead of passing over the hot-water pipes, passes through them. Open fireplaces recessed are also used, and the chimney-pieces of these, relieved by tile sides, are pleasingly designed in harmony with the style of the building. Mr. J. J. Thomson, A.R.I.B.A., who is the architect, has certainly made the most of the site, and the rooms for practical surgery on the upper floors, and the theatres and conveniences are carefully planned. With regard to the style, the treatment is of the simplest character in a sort of Free Classic, but in some of the external features partaking of Queen Anne. The front is of red brick, and is relieved by a gable on one side, which forms the external wall end of the post-mortem theatre. The surface of the gable is panelled. A deep enriched cornice of moulded brick separates this story from the next, and the treatment here consists of plain red brick pilasters between the large windows of the laboratory, a frieze of ornamental brick being obtained between, below the cornice. There is a rather ornamentally treated brick porch, with Ionic columns and a cut brick pediment, and the remainder of the lower story is rusticated in brickwork. It would have improved the effect of the gable if the curves had been bolder or a straight gable had been introduced. The difficulty, however, was to conceal the lantern, and this has been done by carrying up the centre part a little higher than the rest. The cost of the building has been about £11,000; the builder is Mr. W. Shepherd, of Bermondsey, and the architect's clerk of works, Mr. H. Elmes. The premises recently occupied by the school have been utilised in enlarging the out-patient's department of the hospital.

We noticed at the opening conversazione several exhibits of interest. Specimens of pharmacy, by Messrs. Burroughs and Wellcome, Messrs. Savory and Moore, and Mr. Martindale, and some surgical apparatus lent by Messrs. Weiss and Sons and Messrs. Ash and Sons, besides microscopes and other scientific instruments, were exhibited in the several rooms. The electrical apparatus and the phonograph of Edison, exhibited and demonstrated by the London Stereoscopic Company, elicited much attention and interest from the visitors; and we must not forget to notice several water-colour drawings lent by Mr. J. J. Thomson, of Westminster cloisters, Wells Cathedral, views in Belgium, and on the Loire, of special merit; also some art porcelain, metalwork, and sculpture, respectively lent by Messrs. Phillips, Messrs. Gardner, and Messrs. Bruceiani, which adorned the upper rooms.

THE NEW GALLERY AT THE BRITISH MUSEUM.

AN additional gallery is in course of construction at the British Museum, which is intended, we understand, to receive, among other objects, the colossal statues of Mausolus and Artemisia of Caria, which are well known to every student of archaeology and art. As the new gallery will form an important extension of the western wing of the museum, and as the design and construction, though they agree in all essential respects with the galleries adjoining, may be considered to be a typical study of a gallery for works of sculpture, in which good lighting is an element, we may give our readers a general idea of the structure from a personal inspection of the works. The British Museum, as our readers are aware, forms a spacious hollow quadrangle, the main Ionic facade towards Great Russell-street forming the chief entrance front. The wings which form the main galleries appropriated to classical archaeology are on the western side, and the building now constructing occupies a vacant parallelogram-shaped area at the end of the Hellenic Gallery, inclosed partly by the Elgin Gallery, and parallel to it.

The interior dimensions of the new gallery are about 150ft. in length and 40ft. in width, and its height to the coffered or panelled ceiling is 30ft. These dimensions are satisfactory, as may be seen by looking at the Elgin gallery adjoining. The lighting will be by three large skylights, the sloping sides of which are considerably raised, we should say about or a little higher than a square pitch. In this respect exactly the same proportions have been adopted as those of the skylights of the adjoining galleries. The entrance to the new gallery will be at one end by a descending flight of stone steps, and these flights of steps are designed as copies of the old ones, in which the capping or ramp is carried by small fluted columns of the Doric order. The building we find has made considerable progress; the roof is on, and is being covered with copper, a material which it appears is laid on all the flat concealed roofs of the museum, and from inquiry and inspection of them we find the material has well justified its use, as the old roofs are in a perfect condition, and quite watertight, the sheets having a coating of a greenish blue, which is known to preserve the metal from further corrosive action. As a few details of the construction of this gallery may be acceptable to some of our readers, as being a replica of the main parts of this vast structure, and as showing how museum galleries may be designed in accordance at least with the highest authorities of buildings of this kind, we give the results of an examination made with Mr. Pulman, the clerk of works. The walls of the new gallery are mainly the old ones, the windows of which have been filled in with brickwork. Nothing can surpass the solidity and durability of the old work, which has been cut down here and there for the new gallery. One cross-wall we saw, of about three bricks thick, showed brickwork of excellent quality, and the old concrete which has been broken up cannot be excelled. Sir Robert Smirke, the original architect, was noted for his substantial construction, and it must be remembered that architectural buildings of this magnitude were carried out without stint of money or material forty years ago. Thus, surrounded by the old walls, the main task of construction is the roof. About twelve wrought-iron plate girders, of 40ft. in the clear span, cross the new gallery, and upon these the roof is constructed. Each girder has a bearing on stone templates, and is of a depth of 3ft. in the centre, the top flange being slightly

cambered, so as to obtain a fall on each side. These girders, of which there are four to each skylight, are so spaced as to form one bay or panel between the lights, and, as will be seen, each skylight will be crossed below by two of these girders, or as they will appear below, architraves. Upon the upper flanges of these girders purlins are placed; above them are wooden joists, carrying 1½ in. boarding for the copper sheets. These sheets are laid with their edges turned up, each edge being covered by that of the adjoining sheet; with regard to the horizontal joints, these break in the centre of each run or half of roof, and are made of seven laps. The sheets are well turned up at the skylights, and spacious gutters are formed on each side to carry away the water. Each sheet measures about 4ft. by 2ft., and has a weight, we should say, of 20oz. per square foot. The value of copper as a covering we have before spoken of, and for the roofs of our public buildings which have flat pitches, its comparative lightness and appearance are points in its favour while the cost of copper does not greatly exceed 8lb. lead. As we have hinted, the old coverings show a coating of carbonate or verdigris, and this film forms a protective coating which prevents further oxidation. Copper, however, oxidises very slowly. Each of the iron girders which we have described, is cradled down with woodwork to the required level of the beams which cross the ceiling and divide it into panels; and the ceiling itself is also suspended from the roof, and presents one mass of cradling. This part of the workmanship reflects the greatest credit upon the carpenters employed, each of the coffer in the compartments being obtained in this manner. The new roof is not quite so high as some of the others, and is well protected on all sides by the walls and parapets of the adjacent courts. The new gallery is being carried out under Mr. John Taylor, the architect to the Office of Works, by Messrs. McLachlan and Sons, Mr. Charles Pulman is the clerk of works, under whose personal supervision the works are being executed. A glance at the roofs of this single wing of the museum gives one a general idea of the extent covered by it, and the economic conversion of the area. There is no other roof in London which presents so extensive an area of flat surface and skylights; and a view from the upper flats shows much that is interesting and instructive. People never see the roofs of the British Museum, and many, no doubt, wonder, as they perambulate the spacious courts of the interior, to find so much light in a building which, externally, is windowless and extremely gloomy-looking. The gigantic dome of the reading-room is inclosed between the four blocks which form the quadrangle, and the whole of the vast area is thus lighted by glass roofs hidden by the parapets of the buildings. We are not saying the plan is the best or most desirable for lighting sculpture and fragments seen under the most brilliant atmospheres in their original places, but the top light gives the nearest to perfection we can get in London. Round the inside of all stone parapets of every building runs a cast-iron main-pipe of 4 in. diameter, with stop-cocks and connections for hose, &c., by which, should a fire occur in any part, the whole of the roofing could be deluged with water at a good pressure in a few moments. It is needless to say a word in praise of this arrangement upon a building which is the national depository of our treasures.

Architecturally, the ceiling of the new gallery will be finished to correspond exactly with that of the present Elgin gallery, the treatment of which is strictly Greek of the Doric order, and the details in this respect are worthy of the taste of its original

architect, who seems to have followed the best examples of the Athenian Acropolis. An unrelieved wall supports the cross beams of the ceiling, and the whole effect of the panelling and mouldings will be heightened by polychrome decoration. The present walls of the Elgin gallery are of a rich chocolate or Pompeian red, and the ceiling is picked out in appropriate colours. The dark background is a good relief, though when the galleries are again painted, and they sadly need cleaning, a lighter key of colour may be found better suited to afford more light. As the galleries of the richest specimens of Greek Art, we hope the trustees will avail themselves of the best advice in any new decorations of these galleries, so that they may be in strict accordance with what we know of Greek polychromatic decoration, but of so simple and subdued a tone as not to detract from the value of the works exhibited. No mistake could be greater than to design the galleries of a museum in a rich or elaborate style of architecture, or finish it over-decoratively, and in this respect the severe and simply-treated galleries of Sir Robert Smirke have in them something appropriate to their use which will go a long way to redeem the expenditure on a façade, masked by porticos of detached columns, that has not found admiration in the eyes of many of this generation.

TIMBER ROOFING.

A GOOD treatise on roofing is one of the wants of which the literature of practical building is in need. We have, indeed, a number of works treating of the theoretical principles of the subject, besides several books and papers touching some of the more practical requirements of the builder; but these take little account of some matters which are constantly occurring in practice. The formulation of certain data respecting quantity of material in trusses of particular spans, with regard to cost, the material and weight of covering of different pitches, and the stresses to which ordinary types of roof are exposed, would be of considerable use to the architect and builder. These might be arranged in a tabulated form for reference, the spans being given every 5ft. of length and the approximate size and stresses given for each timber. With regard to the effect of the laminated rib roof very little has been published that would afford architects the means of comparing them with the ordinary framed kinds. No doubt the cost of a laminated roof is less than that of one of the ordinary types for wide spans, but it would be useful to know the comparative cost of their construction; and the same information would be valuable with respect to roofs framed on the Gothic principle, in which the truss is absent. With respect to all these varieties, which have no direct tie at the springings, the architect and builder are in some doubt as to their thrust on the walls. The collar is a doubtful tie, and the thrust of such roofs must be left to the stability of thick walls and buttresses.

The cube timber in ordinary trussed roofs, and the cost of labour are questions which are repeatedly asked by the architect and surveyor; and if, in addition, he knew where to turn for scantlings of timbers of different forms of truss and collar roofs, many useless inquiries would be saved. A certain kind of open roof is required, and it is often a question what form is the best or the most economical. The sizes or scantlings for timbers might easily be obtained from knowing the total weight on one bay of the roof, and the calculation need not be a long or tedious one. Having the total weight, each of the pieces of the framing would be represented by a certain multiplier

suited to the angle of roof; in fact, the size of each timber would be found by using a certain constant representing the stress in terms of the weight. Tables of safe loads for timber exposed to compressive, transverse, and tensile strains, would then furnish all that was required. Thus in a trussed roof the strain on tie-beam would equal the weight multiplied by a decimal number or constant representing the stress, and then assuming a certain thickness of framing, and the length to be given, the size of timber is at once obtained. A similar process would enable the sizes of struts, rafters, king- and queen-posts, &c., to be easily found. What the architect requires is a series of typical roofs, for which all these particulars have been worked out, assuming, of course, a certain total weight on each bay. Tables and graphical diagrams would be sufficient to furnish all the cases likely to occur. The span and the angle of pitch would be the chief varying quantities in each kind of roof. The merits of different kinds of roof-covering are imperfectly known to young architects, and the market sizes and thicknesses of lead, zinc, galvanised iron, and copper sheets, the weight of each of these per foot, and their comparative durability, are questions constantly demanding solution. How often have our "Intercommunication" columns contained questions respecting the advantages of certain kinds of roof, their thrust, and the scantlings required; or asking information on the method of laying felt, zinc, and other materials. There is ample material for data of the kind we have indicated: tables and textbooks on materials abound; but the misfortune is the information is fragmentary and scattered, and one has to turn to half-a-dozen textbooks for the particulars, and even then the information is not exactly the kind or exhibited in the form required for practical builders, who have little mathematical knowledge.

Viewed in an artistic sense, the subject of timber framing is especially interesting; but few works have been published which are of much general interest to the architect. Palladio has published four designs of timber framing, and it is worth mention that to him we owe the principle of diagonal framing, with radiating pieces joining the upper and lower ribs, and which has been used on a large scale in many of the timber bridges in America. A similar design has been carried out over the Schuylkill, near Philadelphia, with a span of 340ft., and a rise of 38ft., having radiating pieces. The ribs are braced together by diagonals. Bridges with polygonal arches are common, the roadway being level at the top, and these constructions are always more or less artistic, however liable they may be to derangement from the number of pieces composing them. The Mediaeval architects have furnished us with several admirable instances of artistic framing, examples of which in England have been published by Mr. Habershon, in his work on the "Roofs of the Middle Ages."

THE CHURCH CONGRESS.

THE twenty-first Church Congress was opened on Tuesday morning at Newcastle-on-Tyne. Yesterday the following paper was read by Mr. G. F. Bodley:—

MODES IN WHICH RELIGIOUS LIFE AND THOUGHT MAY BE INFLUENCED BY ART.

The subjects given for the papers this evening are "The Modes in which Religious Life and Thought may be influenced by the Arts of Architecture, Painting, and Sculpture." It has fallen to my lot to bring before you a few thoughts on the subject as connected with the first of these sister arts—that which is, indeed, the queen and mistress of all. First, let me say that while religion can be independent of art, in its highest phase, can hardly exist, cer-

tainly cannot thrive, without religion. So that I could wish our subject had rather been, "The Media in which Art may be, and has been, influenced by Religion." For there has been no great school of art that has not drawn its origin and impulse from religion, and been inspired by it. I am not speaking now only of Christian art; it is true of all great art, Pagan as well as Christian.

Man's greatest and most lasting works show his highest ideal. He will express these in the noblest way he can, and make them durable; a monument of his highest thought and faith "for those that come after." It was so with the Pagans; and while their houses, with few exceptions, have perished, so that we know them not, their Temples, though in ruin, still stand as monuments of the religion out of which they rose. That religion has long passed away, but its symbols can still be seen. But while religion can live without art, it is only natural and reasonable that art should be employed in its service. We are complex beings, with sense, intellect, spirit. We have reason; but imagination is just as much a part of ourselves. Both should have due play in our religious worship. And surely for our Christian faith—the Gospel of the Son of Man—it is especially reasonable that art should lay its services at her feet. If, then, it is true that the highest art has had its spring in religion, so, in an especial way, is it true of architecture. Architecture is in some respect like music, the expression of abstract ideas. It is eminently expressive and symbolic, and fitted for the use of religion. Christian architecture shows one long effort to reach after the ideal, to aspire. You know the history of Gothic architecture in Christendom. It had its rise from Roman buildings of the later time, and in our own country the rude Saxon Church is presently supplanted by the more stately Norman edifice—that giving place to the Gothic creations of the middle ages, when a great church was, as Lord Lindsay said, "the very embodied idea of the spiritual Church," instinct with symbolism, not merely in details, but in the whole structure soaring upward to heaven. And here let me say that few of us have any adequate idea of the beauty or the full teaching of a great church in the best times of ecclesiastical architecture. We see our old churches denuded by the ruthless hand of revolution, starved by the coldness of a worldly age, and, often now empty, swept, and yet garnished by so-called restoration. Those only who have the eyes of knowledge and imagination can conceive the glory of a large church of the middle ages. It was a great school for art, as well as for religious aspiration. And consider how full of teaching these churches were; first in their ideal character as a whole, as shrines in which Faith offered God her best; and then in all their detail of carved and painted subject and imagery—not cold and bare, as we see them now, but glowing with the glory of colour, and full of saintly figures and painted Christian story. Westminster Abbey, beautiful and solemn as its tone is still, was very different once. As all our old churches, it was painted richly. Even in the west doorways of Tintern Abbey were coloured and gilded, and that with only a pent-house roof over them.

Few, indeed, are those whose hearts have not been moved and uplifted by the great churches of Christendom. And, apart from this impressive character, there is the silent witness for religion which every religious building bears; a witness in which the rude wayside chapel, the simple village church, and the stately cathedral alike share. It is a true instinct of this witness for religion that has made Churchmen protest against the destruction of ecclesiastical edifices in the City of London; and a true artistic feeling has in the past. Wren's churches took the place of those existing before the great fire. The memory was perpetuated; is it now to vanish? If the City is deserted by night, is it not covered by day? Or are we to be Christians on Sundays only? In our more religious age these churches, allowed to remain, may be turned to better use. It is to be hoped this example may be followed in our other great towns. If church monuments are to be destroyed, let them be destroyed elsewhere, and not destroy these symbols of the piety and faith of earlier times.

But I must offer a few practical remarks on architecture, as it can best serve and assist our Christian worship. I need not discuss the style in which our churches should be built. It is wisely settled that Gothic should be employed. Coleridge expresses the moral influence he found in a great church, and the difference of feeling wrought by the Gothic and Classic styles. "When I enter," he says, "St. Peter's at Rome, or St. Paul's in London, I feel how great a man; but when I enter Westminster Abbey, or a great Gothic church, I feel how small man I am." I would say on style, that I think we should more frequently employ the later manner of the 14th century. That, and the work of the early part of the 15th century, have been too much neglected. The artistic history of the middle ages was one of advance and increasing refinement. The drawing of the figure, in wall-painting or on glass, if not in sculpture, was continually improving. We have been too ready to call the later Gothic work "debased." I would say, on this point of style, that we are getting too far away from ancient examples and models. In the earlier stage of the Gothic revival these were more taken as guides; guides, at any rate, in their spirit. This is an age of science, not of art, and it is not ripe for any new style. Certainly the attempts to form a "Victorian Style" have not been successful. Style is, after all, only a language. New things may be said in an old tongue; and we need not invent a new language to write a new book. Our beautiful old English Gothic will serve for all our requirements, and is capable of infinite variety and freshness of design. Let us keep to our own manner of English architecture. There may, of course, be exceptional reasons for the use of other styles. For example, a private chapel attached to a house of Renaissance architecture may be probably best carried out in that style.

Next I would urge that we should build larger churches. To be impressive in scale is of more value than detail; though detail is of great importance to give the impression of size and mystery to a building. It is surprising how the skilful use of detail can produce an effect of vastness; and how largeness and coarseness of detail dwarfs a building of considerable dimensions.

It is an important question how far fewer but larger churches would not be better in our great towns than the churches we build of the regulation size, holding, it may be, some eight hundred people. Would it not be better to build in such places for two or three thousand souls, and have outlying chapels associated with the great mother-church of the district? Surely such churches could be more effectually and economically worked. We lose the force of the "sympathy of numbers" felt in the "great congregation." Mr. Beresford Hope, more than twenty years ago, advised larger churches being built; buildings more cathedral-like in dimensions and design.

In great cities, like this in which we are met, churches should be erected more monumental in character and more spacious. Our domestic buildings are growing, and our ecclesiastical edifices should grow also. How striking is the view of a great city seen from afar, with its church in its midst, towering above the houses, and stamping a character on the whole place and country, a silent witness for the Faith. I would plead, then, for churches with ample floor space and height. In architecture nothing is so impressive as height. That can be attained even if the site of a town church is cramped. It should be almost a rule, that every town church should be as large as the site allows of. A practical piece of advice is, not to try and get everything done at once, and so cramp the whole. Let us design on a dignified scale, and have the work carried out as time and funds allow. We may well leave some unfinished great conceptions for the future to mature. We are not without examples of old buildings, of most dignified proportions, in some of our parish churches. But it is true, as Mr. Ruskin has said, that here in England we "have built like pigmies." It is time we built on a larger scale. Our churches should not be crowded with fixed seats; more space should be left for ample gangways, and around the entrances. There are those who, entering to gaze, may "remain to pray." For such these spaces would be of much use. Our church building societies should make their grants on the area of the floor, not

on the numbers that can be crowded into fixed seats. It would be a good plan for a town church to screen off one bay at the west end with a high and defensive, but open iron grille. The doors of the church might stand open all day, and passers-by could enter and use that part for their devotions. Such a part of a church, thus screened off, might be all but open to the street. To thus see, from the glare of the noisy street, the long perspective of a dim interior, solemn in its repose, with altar and high reredos gleaming in the distance, would, I think, be at once edifying and certainly artistic.

I pass to other practical points. Our town churches should be more frequently vaulted. This feature, so seldom adopted in England, lends dignity, impressiveness, and solidity of effect. As compared with a handsome open roof, it does not very materially add to the cost of a church. Again, I would urge that the interior of our churches should be more considered; be better and more fully furnished, and have more care and thought spent on them. An exterior is of far less importance, so long as the proportions are good and dignified. For the most part, in our great towns, there are few places where it much matters what the exterior may be; the situation is destroyed by the ugliness of modern surroundings. It is of no avail to be harmonious with discords all around. But it is not so in the interior of a church. There the architect is in full possession of his audience, and what he has to say of noble thought, or religious expression, cannot but be heard. Our churches should be treated much on the principle on which we treat our houses; it is on their interiors we spend most thought and adornment. We want more sculpture and painting; our old churches were full of them, though some brackets or corbels, and some marks of colour under white-wash, may be the only signs remaining. Would not sculptured figures of those who have been great in the story of the City of God teach and edify? Would not the representation of Christian events be especially useful for the poor, and bring objective truth more home to their minds? Dr. Arnold wrote of what he saw abroad: "The open churches, the varied services, the beautiful solemnities, the processions, the Calvaries, the appeals to the eye and ear through which the heart is reached, have no natural connection with superstition." "It is idolatry, bowing down to fallible men; not to bend knee and heart to every thought and image of Him Who was manifested amongst us." Only the other day, a country labourer, seeing a chancel cross that had been restored with the figure of our Lord, said, "You don't tell me they treated Him in that way?" He had never before realised the fact of the Crucifixion; never, I suppose, having seen it represented. That is, I think, a striking fact, and a strong plea for such representations in a Christian land. Our ancient churches invariably had the figure of our Lord on the Cross at the entrance to the chancel. A central fact of our Faith was thus evidently set forth. "Sic Deus dilexit mundum," "Thus God loved the world," is an inscription I have seen under such a representation of our Lord, with outstretched arms, embracing the whole world, as it has been said. Would not such representations fix the wandering thought, help aspiration, and deepen reverence?

Another point is the need of more private and quiet places in our churches. The side-chapels of old churches afford places of retirement for private devotion. Might it not be well to revive these chapels, using them for early celebrations, and other services, when the worshippers are few? Have we not suffered from the violent reaction in these matters that swept over the 16th century? We need every help in religion; let us avail ourselves wisely of all. In former days in our land, and now in many places abroad, the churches were and are the very homes of the devout poor. In the early morning, before the labours of day, and in the evening, before the rest of night, the poor frequent the great and solemn churches, and seek silence and repose, there to pray for the rest that remaineth and the House that is eternal. What a change and repose to them, after their cramped and squalid homes, and the noise and hardness of the day's work, to find privacy and dignity in the great silent darkening church, and there pour out their hearts to God. Let us build and adorn our churches for God and His poor. It was to the poor "the Gospel was preached."

Another point is *concentration of ornament in the interior of our churches*. Concentration of richness is a great artistic principle, now too much neglected. In all our work let us reject what is frivolous or tawdry. As in ritual, so in architecture and its ornaments, our aim should be *solemnity and dignity*. A noble reserve and restraint in ornament is a high quality in all art. Nature teaches us this; its jewels and finest metals are rare. The fabric of a church may be simple, even to severity; but if there is concentration of beauty and richness, the result at once satisfies.

That concentration of ornament in a church should, I need scarcely say, be in the choir and sanctuary. The simplest edifice, with a well-raised and dignified altar and reredos, will at once have a religious and impressive effect.

We live in a time when Puritan prejudices, as far as externals go, are passing away: and we should avail ourselves of all aids to devotion, so long as they are manly and noble. I think we may do so fearlessly. Hooker says: "Certainly Almighty God has nowhere revealed that He desires to be served meanly." He was writing with Puritan prejudice around him; and one detects the latent satire. There are few things more singular than this prejudice against dignity and beauty in the worship of God. The Puritans took their phraseology from the Old Testament, and would smite their enemies with a text from the Book of Joshua. They turned the first day of the week—the glad echo of Easter—into a Jewish Sabbath, tinged with gloom, instead of brightened by praise. But there was one leading idea of the Old Testament they did not imitate: the honouring God with their substance. Strange to the Puritan mind must have seemed the directions for the work of the Tabernacle and the Temple! Strange must have seemed "the gold and blue and purple and scarlet" of the Tabernacle, words coming in continual refrain; or the carved cherubim wrought by him "who was filled with the Spirit of God in wisdom and all manner of workmanship"! Strange that House of God, of hewn stone, which rose in silence, lined with cedar or beaten gold; its doors carved with flowers; their hinges of gold! Certainly God did not then desire to be served meanly. And yet it is with such prejudices, however sincere, that the religion of our land has been saturated. Happily the blight is passing. It is a prejudice, I believe, alien to the English mind, and one from which it will break free.

Let me conclude with the words of two writers of opposite schools. James Martineau says: "What is falsely called a purely spiritual worship is an attempt to evolve and sustain devotion from isolated powers of the spirit, that are never meant to act alone. That God is a Spirit has not hindered Him from shaping the vault of night and hanging it with stars, or from clothing the earth with its beauty." "They are the works of His creativeness; the appeal of His beauty to our hearts." Lord Lindsay wrote: "The Church of England does not exalt Imagination, and repudiate Reason; but includes them both, harmoniously opposed within her constitution, so as to preserve the balance of truth—thus approximating, in degree, to the ideal of human nature, Christ incarnate, of Whom the Church is the Body, and ought to be the Likeness and Image."

Papers on kindred subjects were also read yesterday by Prof. W. H. Monk, and Mr. T. Gambier Parry. The last paper, together with the discussion on the general question, in which Mr. Beresford Hope and others took part, we may probably give next week.

THE ECCLESIASTICAL ART EXHIBITION.

The Ecclesiastical Art Exhibition has been held in connection with the Church Congress at the Northumberland-rooms, Pilgrim-street, Newcastle. Close to the entrance-door on the right is the stand of Messrs. Jones and Willis, of London, upon which is displayed a large collection of church furniture and articles of decoration. The speciality of the stand is the "Hesperus Lamp," made for lighting small country churches and mission-rooms where gas is dear or difficult to come by. Each lamp of the "Hesperus" kind gives a light of 45 candles, and, as it burns petroleum or any other kind of mineral oil, it is quite easy to manage. Nearly opposite to this collection is the space occupied by the display of Messrs. J. Wippell

and Co., of Exeter, who show brass altar vases, together with such church fittings as gaseliers, lamp and gas standards, &c., &c. An interesting object placed for inspection on the opposite side of the hall is the last of the Newcastle sedan chairs. This relic is the property of Mr. Elgee, of Pilgrim-street. Middle-aged men still remember seeing the sedan chair with its bearers in the streets of Newcastle, some three or four ladies of the old school continuing to use it as a means of conveyance up to about thirty years ago.

In the gallery at the west of the building an entire section is set apart for the exhibits of Mr. G. J. Baguley, artist in stained-glass, Carlisle-street, Newcastle. First we come to a series of cartoons representing subjects for stained-glass windows of various styles.

In one of the side rooms of the gallery which encircles the hall are the exhibits of Messrs. Cox, Sons, Buckley and Co., London. Noticeable amongst the objects of art shown by this firm is a carved oak reredos, constructed for the church of Kelsale, Suffolk. In the same department is a reredos, less important in size and in art value to the one just described, but still of good design. The central panel is divided into two sections, each of which are occupied by paintings on a gold ground, the higher of the two containing a representation of the Crucifixion, with St. Mary and St. John at the foot of the cross. The lower section contains a faithful copy of the picture of St. Phillip of Assisi. At the east end of the large gallery this firm shows a design for a stained-glass window placed in Leatherhead Church, to the memory of the late Bishop Utterton. The subject is the Last Supper. Close to this design is a cartoon of the east window in St. Mark's Church, Leamington, the design for which has been furnished by this firm. The firm have also upon view a photograph of the pulpit originally executed by them for the church of St. Nicholas, Great Yarmouth. Messrs. Cox, Buckley and Co., also show a series of church vestments. Ecclesiastical plate also forms a large portion of the exhibits of this firm. At the end of the room is an altar fitted up with proper furniture. The altar-cloth is well worth inspection. It has been designed for the Church of St. Matthias, Kensington.

The stand of Messrs. Doulton and Co., of Lambeth (whose representatives in Newcastle are Messrs. Walker and Emley) contains four Scriptural pieces in terra-cotta, being "The Entry in Jerusalem," "The Times of Solomon," "Christ reproving His Disciples," and "The Judgment of Solomon." "The Times of Solomon" are represented by two sets of seven figures each, showing the time to keep silence, represented by the figure of Miriam watching Moses; the time to speak, represented by King Ahasuerus; the time to read, Job reading his garments; the time to sew, Adam sewing fig-leaves; the time to get, Delilah counting money; the time to cast away, Judas casting away the price of treason; the time to embrace, the Shunammite woman and her son; the time to mourn, Naomi refusing to be comforted; the time to heal, the maniac among the tombs; the time to dance, Miriam at the Red Sea; the time to be born, Virgin and Child; the time to refrain from menace, Joseph in Potiphar's house; the time to refrain from embracing, Joseph running away from Potiphar's house; the time to lose, Samson finding that his hair had been cut off; the time to die, Samson overthrowing the pillars. The designs are by Mr. George Elinworth. Messrs. Walker and Emley, of Newcastle, occupy a stand close to Messrs. Reid's station, and the most striking object in their portion of the exhibition is an elaborate marble floor, the squares of different-coloured marble being solidly inlaid in a body of cement.

Close to it is located the stand of Mr. Thomas Harding, Stokenchurch, Oxon, who shows some excellent specimens of church furniture. Chairs such as are now in vogue for seating cathedrals, minsters, and other large churches, are here to be found in all known shapes. Especially noticeable is a design for a church chair with a sliding kneeling-board at the back. This convenience can be drawn out and replaced at a touch, and in many churches would supply a want that is greatly felt. A peculiar chair of this construction is shown in a design supplied to the Hook Memorial Church, Leeds. The chair is rush-bottomed, of Gothic outline, and the back so constructed as to furnish a back-sled for the worshipper behind. The kneeling-board

works upon a hinge, and can be taken down and replaced at pleasure.

THE LOAN COLLECTION.

The section known as the Loan Collection contains a large number of articles of extreme beauty and rare workmanship. A small case lent by Mr. C. Watkin Williams Wynn, contains a carved ivory diptych illustrating some of the chief events in the life of our Saviour. The object is of about the period of 1350 or 1400, and is probably Nuremberg work. It was purchased in Paris during the short Peace of Amiens in 1802. The diptych is divided into four panels on each side. The incidents in the life of the Saviour, which are cut in high relief, commence with the Annunciation, and carry on the sacred story through the Adoration of the Magi, the Slaughter of the Innocents, the Flight into Egypt, the Presentation in the Temple, the Last Supper, and the Crucifixion and Interment of Our Lord. By the same lender is displayed two ancient missals printed in Paris in the years 1501 and 1503 respectively, which are worthy of inspection.

A collection of articles, displayed in a large glass case set up on the side wall of this room, has been lent by Mr. William Bragge, of Birmingham. The case contains no less than 124 "Icons" or religious pictures used in the Greek Church in Russia. These are chiefly in brass, and many are enamelled, but some are painted and mounted in silver gilt and in silver, whilst one or two are in gold leaf. There are twenty-four crucifixes in the case, many of them plain in workmanship, and of small intrinsic value; whilst others are encrusted with jewels. There are a larger number of diptychs, triptychs, and other religious emblems carried about by the Russian peasantry.

A case, lent by Mr. Thos. Wm. Usherwood Robinson, F.S.A., is well worth an inspection. It contains an autograph of the celebrated Apostle of the North, Barnard Gūpin, the rector of Houghton-le-Spring, and the Ecologist of the district of the North Tyne and Reed-water, who flourished between the years 1558 and 1585. Scarcely less interesting and more attractive is a silver chalice, made at York in 1590. This article, which is of the usual dimensions, has been hammered out of a single piece of silver. It is a unique specimen of the silversmith's art as it existed at the latter part of the 16th century. Rich ornamentation is very sparingly displayed upon it; but the geometrical figures with which its stem and foot are decorated are very curious and fine. A unique silver reliquary makes up the collection lent by Mr. Robinson. This article has a silver chain attached to it, and was apparently worn round the neck by some devotee, apparently of the 16th century, to which period its ornamentation belongs, and it was found suspended round the neck of a skeleton exhumed in the churchyard of St. Dunstan's Church, in Fleet-street, when the old church was demolished in 1831. The reliquary bears two figures—one of St. George in the act of piercing the Dragon, and on the other is the Empress Helena bearing the cross in her right hand and a book in her left, whilst in the background are the buildings of Jerusalem. The workmanship appears to be of Eastern design, and of the period above stated, and is probably copied from more ancient representations. The reliquary is in splendid preservation, and the work upon it appears as fresh as on the day it was suspended round the neck of its first wearer.

In this section of the exhibition is a collection of the badges of the several guilds in connection with the Anglican Church. The decoration of the Guild of St. Alban is very conspicuous in that respect. It has a bright blue ribbon, from which is suspended a straight cross, surrounded by a well-known emblem of the first martyr of the English Church. The badges are carefully mounted on cardboard, and each is marked with the guild to which it belongs.

One of the most striking objects is a jewelled processional cross, at present in use in St. Augustine's Church at Kilburn. In the centre of the cross is a jewelled Maltese cross, set in precious stones. In this decoration the jewels used are emeralds, one of which figures on each of the four points of the cross, with a large opal in the centre, surrounded by several kinds of stones in which rubies are conspicuous. At the four points of the cross are the emblems of the Four Evangelists.

Interesting in another way is a medieval relie

placed upon one of the side tables, and lent to the exhibition by the Rev. L. E. Owen, vicar of Farnham, near Chester. This instrument is known as the S. O. B. Bille, and, curious to say, it is known to have been in use since the commencement of the present century; the churchwarden of the parish of Farnham having led a woman, a notorious sinner it may be supposed, through the village and parish church during the time of divine service, with his bridle hooked up in her head.

Mr. C. Hodgson Fowler sends a chalice and paten of the fourteenth century, German work. The chalice is massive, but plain in design, and displays no jewel of any kind in its ornamentation. The base carries six bosses, on which are letters. The paten is simply a plain plate, without ornament, engraving, or chasing of any kind. There is also a chalice and paten enriched with enamel, fifteenth century, Italian work. The chalice is a silver bowl, gilt in the inside, standing upon an elaborately ornamented stalk, which bears six enamel. The base is also beautifully carved and worked. The paten is very plain, the only ornament being an enamel in the centre. A Spanish chalice of the fifteenth century is exceedingly curious, on account of the elaborate decoration of the stem which supports the bowl, and of the shape and mode of fixing of the bowl itself. Quite as interesting is an enamel, of Italian workmanship, dated 1670. The receptacle for the frankincense is covered in at each end, and the lid is in the centre. The whole of the surface is elaborately ornamented, while the stem is quite plain, and is little in character with the superincumbent part of the vessel. Along with this collection are a couple of objects lent by Mrs. C. Hodgson Fowler. The more striking of the pair is a cross of mother-of-pearl, brought from Jerusalem, and minutely carved. The Crucifixion is represented in the centre, with emblems of the Trinity above, and the weeping Marys at the two points of the cross. Below is a skull and cross-bones, and the figure of one of the saints. Very beautiful is a baptismal shell, from Bethlehem. The concave surface of the shell is quite plain, but the back is ornamented with elaborate carving, the principal subject being the birth of Christ, the Infant Saviour being shown in the manger, with St. Mary and St. Joseph kneeling beside him. The Star of the East is seen shining in the distance.

The collection of ecclesiastical plate and pen-and-ink sketches lent by the Superior of St. Dunstan's House, Plaistow, Essex, is on view in the case on the left, as the visitor enters the room in which the loan collection is on view. The chalice and paten used in the Brotherhood oratory, were designed by the Rev. E. Geldart, and executed by Messrs Barkentin and Kraal. The chalice is of "parcel gilt," enriched round the base with jewels, which are set in massive bosses, and which lend an effect of extraordinary richness to the sacred vessel. The base, knob, and stem are counter-chunged, with a view to secure variety of outline. The style of the whole design is "Late Decorated." In the same case is a silver tankard presented by Thomas Wentworth, Earl of Stafford, to an ancestor of the gentleman who lends it for exhibition. The tankard is massive in outline, and is an excellent example of the silversmith's work of the period. It bears the inscription "En dono Earle de Stafford, 1623."

The Rev. A. W. Headlam, of St. Oswald's, Durham, contributes some remarkable specimens of ecclesiastical work. The most interesting of these is decidedly the Processional Cross of 11th-century workmanship, now in use at St. Oswald's Church. It was found amongst some old brass purchased by a Durham ironmonger, who discovered its value and interest, and retained possession of it until his death. His widow then presented it to St. Oswald's Church, where it was restored, and a base and staff added to it. The cross itself is of elaborate workmanship, presenting silver figures upon a brass frame. The centre figure of Christ is full of interest to art connoisseurs, the work being just as it left the hands of the medieval artisan, except for the small number of brass which has been fixed over the head. The base of the cross is ornamented by trifoliate and is very open and light in treatment. On each side of it are stands, which carry respectively the figures of the Virgin and St. John. At the points of the cross are lozenge-shaped spaces,

bearing the emblems of the Evangelists. The orb at the base of the cross shows the inscription, "Fulguit crucis mysterium." An old offertory basin still in use at St. Oswald's is also full of interest. It is a massive piece of plate, of silver gilt, and is elaborately worked over its whole surface. In the centre is a cross, with the letters I. H. S. and the conventional representation of the hammer and nails of the crucifixion. Upon lozenge-shaped spaces round the edge are four inscriptions, one of which reads as follows:—"The gift of John Sedgwick, Esquire, A.D. 1699, to St. Oswald's Church in Durham." Two alms basins, one the gift of Mr. David Dixon, and the other of Mr. E. Lambton, to St. Oswald's Church, are also shown by Mr. Headlam. They are plain in design, and comply literally with the rubrical injunction that the alms should be collected in a decent basin. Last of Mr. Headlam's contributions is a silver gilt chalice with cover, of elaborate workmanship, and interesting on account of its shape and beautiful finish.

THE SOCIAL SCIENCE CONGRESS.

THE business of the Social Science Congress commenced at Dublin on Tuesday morning at 10 o'clock, in Trinity College.

ART EXHIBITIONS.

The Art Department was presided over by Sir Robert Stewart in the absence of Lord Powerscourt. Papers on the special subject of the influence of annual exhibitions of contemporary pictures and sculpture on art and public taste were read by Sir Thomas A. Jones, Mr. T. C. Horsfall (Manchester), and Mr. W. Cave Thomas. The consideration of the question commanded a good audience, but the remarkable consensus of opinion expressed in the papers as regards a question which cropped up in two of them as a secondary consideration had the effect of almost obscuring the special subject of the contributions. The discussion turned almost exclusively on the question of the propriety of opening public museums and art galleries on Sunday, and all the speakers except one supported the Sunday opening movement. The feeling of the Art Department has always preponderated in favour of Sunday opening, but such a oneness of opinion on the proposal as was shown this morning is said not to have been manifested at any previous Congress. In the afternoon Mr. J. Howard Pentland read a paper on æsthetics and false art considered in connection with the æsthetic movement, and the prospects of the English schools.

STATE SUPERVISION OF HOSPITALS.

The meeting of the Health Department, presided over by Dr. Cameron, M.P., was rather thinly attended. Mr. Henry C. Burdett read a paper on the desirableness of hospitals being placed under State supervision.

He adduced a great mass of evidence in favour of this course being adopted. He thought that the appointment of a Royal Commission to investigate the subject would secure the adoption of adequate measures based upon the reliable data which would then be forthcoming. He placed first among the circumstances which have produced so active and unanimous a desire for inquiry the many anomalies of the present system of hospital administration. The administration of the hospitals as at present conducted is so uncertain and unsatisfactory that inquiry is needed to secure amelioration in the interests of the poor. To facilitate a right judgment and furnish reliable data, Mr. Burdett had prepared a variety of elaborate and carefully-compiled statistical tables, based upon the published reports and statements of the various institutions. These showed that the cost of management in 61 general hospitals varies from 21 per cent. at Cork, to 27½ per cent. at the Metropolitan Free Hospital; the cost per patient per week from 28s. 1d. at the Cork County Hospital, to £3 0s. 1d. at the Leeds General Infirmary. A difference of 25 per cent. in the cost of management, and of nearly 700 per cent. in the cost of maintaining the patients would alone warrant the appointment of a Commission. The special hospitals show equally startling discrepancies. As to the distribution of hospital accommodation, nearly nine-tenths of the bed accommodation in the London hospitals is situated within a radius of a mile and

a half from Charing cross. North London, with a population of nearly 1,000,000, possesses but one hospital, the Great Northern, with 33 beds; the East-end, with its riverside and manufacturing population of 1,100,000, is dependent upon the London Hospital with 750 beds, and the Metropolitan Free Hospital with 20 beds, both of which are inconveniently situated for a large proportion of the inhabitants. The West-end, with a population of 950,000, has but two hospitals—St. Mary's with 190, and the West London with 60 beds respectively. A population of nearly one-and-a-half millions on the Surrey side of the Thames has to rely upon Guys, with 700 beds, and St. Thomas's with 400 available beds, both of which, though largely endowed, are situated miles away from a portion of the district to the wants of which they nominally administer. The unsatisfactory condition of the present out-patient system, and especially of that in force at the large metropolitan hospitals, demands reform. About 400,000 people come annually to 13 of the best hospitals in London for medical advice and assistance, at an annual cost of £15,000 in medicine alone. The average attendance of these patients is from three to seven hours before each can be attended to, and the rash is so extreme that the medical advice they receive is almost perfunctory. It is desirable that every hospital and medical institution for the poor should be administered by a board of management, subject to periodical election by the governors, upon which board the medical staff of the charity should be adequately represented. An authoritative supervision over the administration and a public audit of the accounts of all such institutions is needed. The absence of organisation and combination among the medical institutions throughout the country materially lessens their usefulness. In the administration of the wards, so far as it affects the treatment of the patients, and especially in the management of the nursing arrangements, the medical staff should have an authoritative voice. Unfortunately, in the majority of the large hospitals the nursing arrangements are under the control of a matron, are unaided by a nursing committee, and only indirectly, if at all, assisted by those alone qualified to direct—viz., the medical staff. Out of 22 hospitals having medical schools, there are but seven where this important department is superintended by a nursing committee upon which the medical element is represented. The importance of medical education, and the adequate training of the members of the medical profession, require an intelligent recognition of the relation of the hospitals to their medical schools, to insure an improvement in such relations. Mr. Burdett left it for the Congress to decide whether or no it was desirable that our hospitals should be placed in some sense or other under State supervision. He claimed to have produced enough evidence to show that the time was ripe for an exhaustive inquiry by a Royal or other Commission.

It was resolved, on the motion of Dr. Cameron, Chief Medical Superintendent of Health of Dublin, seconded by Mr. Darby, of Bray, that the council of the association be recommended to take measures for a prompt and practical inquiry, with a view to securing independent supervision for all public hospitals.

PERSEPOLITAN AND ROMAN ART.

On Wednesday the following paper was read by Dr. Phéné, F.S.A., F.R.G.S., "On the Refining and Humanising Influences of Art. Persepolitan and Roman Periods."

The author drew attention to the fact that, as in former papers he had selected periods, for comparison, in which the national features treated of were either coeval or consecutive, and in which contrasting effects were most prominent, and as his object was to examine the influence of art in forming or swaying national character, the periods now selected exhibited parallel effects from similar causes, though at a greater interval, and with powerful intermediate nationalities, hence leading to more decisive conclusions.

His last paper, on the Asiatic and Roman periods, might be supposed to have included the present one; but in that he had treated of Asian art during the time of the existence of

* See Transactions, 1877, p. 765; 1878, p. 729; 1879, p. 781; 1880, p. 806.

high-class art schools, established after the period he was now considering.

It might be thought that so little was known of Persian art, so little of Persian character, that there was but a slender foundation for evidence. That, he urged, was the evidence; the very little distinctive Persian art, and the flimsiness of Persian character, bearing a marked relationship. The Roman character was firm and vigorous, and the area of Roman arts extensive; but the parallel lay in the complete want of original art in both nations, and with the final similar result of annihilation. Indeed the parallel was even more marked, for, in its earlier history, Persia assimilated to Rome in the primal temperance of its citizens and soldiers, simplicity of manners, dress, and customs—through which both countries achieved their conquests and established their solidity, and at which periods in each, art was unknown. Both also succumbed under a false appreciation of art, from its debasement to bodily and physical enjoyment, rather than the mental and philosophical refinements its culture produces, with their consequent far higher and more intense enjoyment. Although a momentary digression, he could give no better example than the following:—When it was sought to introduce the Asiatic mysteries into Greece, the Greek leaders long resisted them as degrading to the morality of the people. When it was sought to introduce the gladiatorial shows of Rome into Athens, a cry was raised by the populace, "First throw down the altar erected by our ancestors to MERCY" (Lucian).*

Here was true refinement from true appreciation of art; and it would be difficult to show that it proceeded from any other cause, as they were nations of a similar faith, and the Greeks even surpassed the others in military acquisitions and courage, though numerically less powerful, while of the three, they alone understood and cultivated art. They alone had artistic originality which taught them to reject alike sensual effeminacy from the East and the cruel spectacular revels from the West. Greece and Greek fine art alone still live in fact. Rome and Persia but in history.

The effects upon existing nations have been widely different through the Asiatic and the Roman sway, notwithstanding their parallelism in deficiency of original art; for Rome had a period of utilitarian art, in which Persia was wanting.

Both plagiarised to the fullest of their ability; both raised their palaces, and enriched their capitals, not only with the wealth, but the mental powers of the nations they conquered. The stupendous remains at Persepolis, combining the materials and dimensions used by Egyptian architects, with the beautiful fluted columns and the capitals of quasi Grecian art, attest this, though, with an Oriental supremacy and appropriation, the capitals were surmounted by an Indo-Assyrian ornament and shrouded with meaningless fretwork by Persepolitan artists, like the Eastern kerchief thrown over a captured beauty, to indicate that a place would be found for her in the harem. Even the gorgeous apparel of the Persians, and their costly tents and equipments, were borrowed from the Medes; the introduction of which, by the great Cyrus, was a folly of age inconsistent with his youthful chaste severity; when satiated with conquest, and with the world at his feet, he resolved to fix his residence at subjugated Babylon,† he attired himself and his retinue, for the first time, in bejewelled and gold-embroidered Median robes, and with this was changed the retirement of the Persian women, who were thenceforward companions of the march and bivouac. The Persian is the effeminate feature of art.

The curious plan of Oriental enrichments on the sides of the great staircase leading to the celebrated hall of 10 pillars, at Persepolis, though having evidence of the Greek chisel, was also shown not to be original, but to have been borrowed from Chinese design.

Greatly different, the author pointed out, were the ruins of Rome, worked less in costly marble than useful brick, in which she stands pre-eminent. Her edifices tell, not alone of places, temples, and triumphs, but of aqueducts,

factories, shops, and highways—all borrowed from the Greeks of Europe or Asia, it is true; for Asiatic and Egyptian bricks, and (as we now know, from the recent discovery of that at Siloam) the aqueducts of the East also existed before Rome was; but wonderfully adapted and beneficially widely spread. At the very time that Rome was sinking from the influx of sensual luxury that came in with the spoils of Asia—from her citizens not understanding the exquisite perfection and chaste purity of Greek art—at that moment western Europe was being enriched in utilitarian works by her paternal Government, soon to be polluted and withdrawn. But long as was the lapse and recoil into inactivity and darkness, those nations have recovered what she has not, and what Italy is now only slowly beginning to feel—a reascendency, not only of all imparted by that great civilising mother, but with a picturesque and delicious charm arising from what Rome had not—the peculiar originality of each. So that whether in the useful or higher and refined art; in music, painting, or literature, national originality, and national mind and genius ennoble modern countries, while not despising the useful Roman foundation of art established in each. If the Italian fine art school rose first, it should be remembered that Italy was the sole place of deposit for the sculptures and paintings brought as spoils from Greece, some of which paintings remained till the time of Púny, and probably long after.

ART.

The special question considered in this department on Wednesday had reference to the relations of painting and sculpture to architecture, on which papers were read by Mr. H. H. Statham and Mr. Cave Thomas.

It was remarked by Mr. Thomas Drew, R.H.A., in the discussion which followed, that the relations in question were admittedly unsatisfactory, and he ascribed the fault to the extravagant pretensions on the part of some architects to be masters of sculpture and painting, and to design the adornments for their own buildings. Dr. Todhunter read a paper on the prospects of the higher drama in England.

HEALTH.

The Health Department was unusually well attended throughout the day, and a very animated discussion was carried on for several hours with regard to the question of the compulsory notification of infectious diseases by medical attendants.

Papers were read by Mr. W. H. Michael, Q.C., Dr. J. W. Moore, and Dr. Stewart Woodhouse. In opening the discussion, Dr. Jacob, editor of an Irish medical journal, who said he spoke with some authority on the part of the medical profession in Ireland, offered an uncompromising opposition to compulsory notification. He was followed by Mr. Hastings, M.P., who stated that local Acts for compulsory notification in various parts of England and Scotland had worked advantageously, and that it was his intention to reintroduce next Session his Bill to provide for a general system of notification of infectious diseases throughout England and Scotland.

WIMBORNE MINSTER.

THE central tower of Wimborne Minster has recently given signs of failure, and prompt and decided measures will have to be taken to arrest the mischief. Wimborne, says the *Saturday Review*, though not one of our grandest minsters, and much inferior in size to the neighbouring churches of Sherborne, Romsey, or Christchurch, scarcely yields to any of them in architectural and historic interest. Its remarkable outline, presenting a low massive central lantern, and a tall western tower, reproducing on a miniature scale the outline of Ely, and that of Hereford till a hundred years back, cannot fail to attract attention. These two towers indicate the double destination of the church. The central tower, of Transitional date, was that of the collegiate church; the western, of a thoroughly parochial type, was added by the parishioners in the middle of the fifteenth century, as at Blyth, and Christchurch, and elsewhere, to hold the peal of bells. It is the earlier of these towers, that standing in the centre of the fabric, that is in danger. Serious cracks, we are told, have shown themselves in the

north-eastern pier of the crossing. The other three piers also afford ominous indications of internal movement; and, as the fractures are slowly but surely increasing, it is no longer a matter of doubt that the tower is, in builder's language, "alive," and that nothing but a process of underpinning and strengthening the supports of the lantern will save this chief ornament of the fabric from eventual, perhaps speedy, ruin. The foundations of the tower appear to be sound, which is not always the case in Norman buildings, and give no indications of settlement or weakness. The source of the mischief lies in the piers themselves. These, like the works of Norman builders generally, with all their seeming solidity, are so inartificially constructed that the wonder is, not that they should be falling now, but that they should have stood so long. Their huge bulk and apparent strength are simply deceptive. Norman pillars are really nothing more than outside cases of ashlar, or cut stone, inclosing a core of rubble brought into something like cohesion by a vast quantity of mortar, but with no real bond, either in its own incoherent mass or with the external shell. For a long time, longer or shorter (and certainly some of these Norman structures may boast of a tolerably extended existence), these vast bulks stand by the sheer force of dogged resistance. But they carry the elements of their own ruin within them. In the lapse of centuries, the cohesion of the core, small at first, weakens; the rubble becomes more and more friable, and is kept in its place merely by the strength of the outside case, from which, when an aperture has been made, it has been known, as in the central tower of Hereford, to gush out in a continuous stream of powder for several seconds. As long as the shell is able to resist the outward strain the structure will stand. But when once, as at Wimborne, the skin begins to burst, its fate is sealed. The ruin may be more or less gradual, but it is inevitable.

At Wimborne, from the smaller dimensions of the fabric, and the less formidable weight of the tower, the difficulties will be less alarming and the work less costly than elsewhere. It is, however, a task which imperatively calls for the best architectural skill, and for that courage, united with discretion, which nothing but large experience can supply. We earnestly hope that local or diocesan claims will not be allowed any undue weight, but that those with whom the responsibility of the restoration rests will not scruple to take counsel with the first architectural engineers of the day, and will place the actual work in the hands of one who has elsewhere proved his ability to cope with the difficulties and dangers inseparable from such an undertaking. The seat of the evil lying within, in the originally faulty construction and the subsequent disintegration and decay of the masonry, no measure can prove really effectual but the taking down of the defective pier or piers, and their rebuilding with the utmost solidity. All patching or piecing is to be deprecated. It would merely hide the mischief temporarily, deferring, but in no sense arresting, the downfall. Such a course was at first adopted at Chichester. New stonework was built up round the rotten core and bonded with its mass, and with what result we know only too well. The old fissures spread into the new masonry, and new ones soon began to open. The outside casing exhibited only too plainly the hopeless state of disintegration of the mass behind, and, before many months were over, the tower and spire collapsed, and the whole work had to be begun where it ought to have originally commenced—from the foundation. The only true policy in such cases is Stratford's "thorough."

We must, at the same time, express our hope that the restoration of the tower will not extend beyond the necessary reconstruction of the failing piers, and the resetting of any portions of the external work which are actually dangerous. The pyramidal pinnacles and heavy battlements added after the fall, in 1660, of the spire which once crowned it, for the removal of which some are clamouring, though coarse in detail and out of harmony with the beautiful Transitional arcades beneath them, are by no means bid in effect, and are of great value as marking an epoch in that history of the fabric which is so distinctly written, century after century, on its walls, and which would be falsified by their destruction. The re-erection of the spire, however much we may regret its loss, would certainly

* Lucian in Vit. Democriti, p. 1, 214

† Xenophon, Cyropædia, 1-7, p. 193; S, p. 213 to 220 and 246.

type, in 3 spans of 100ft. each, that received the first prize in the recent competition for the proposed Liverpool Exchange Station. The Blackfriars Passenger Station of the London, Chatham, and Dover Railway, 87ft. in span, the New Lime Street Station, Liverpool, of 212ft. span, and the Woodside Station, Birkenhead, of over 90ft. span, are good examples of trussed roofs, with curved ribs. A useful and economical form of rigid arch is to be found in the Bristol Joint Line Station, of 125ft. span, and a good example of a roof forming a continuous girder may be seen at the Liverpool-street Terminus of the Great Eastern Railway, which is divided into two spans of 109ft. each, with two side spans of about 45ft. each. The tied arch, with the tie bar suspended, was another excellent form of roof. This type has been adopted at Victoria Station (London, Chatham, and Dover Railway) in two spans of 127ft. and 129ft. respectively; also at the Central Station, Liverpool, of 160ft. span, and at Queen-street Station, Glasgow, of 170ft. span. While the latter was the largest span of this class, the Central Station, Liverpool, was the boldest design, the principals being at the unusually great distance of 55ft. apart. In both these roofs the tie-rods are of steel, which commends itself for large spans as lighter in appearance than iron of equal strength. The Bridge-street Station and the Central Station, Glasgow, are recent examples of ridge and furrow roofs, running longitudinally, and carried on transverse girders. The former is divided into two spans of 114ft. and 49ft. respectively, and the latter of 213ft. 6in. clear span. It is evident that deep girders of this span need longitudinal bracing, and in the Carlisle Station, consisting of two spans of 128ft. 3in. and 154ft. 6in. respectively, the slope of the roofs are carried by cantilevers, which connect the transverse supporting girders longitudinally, the ridge being placed on the top flange of these girders and the gutter carried midway between them. The author proceeded to describe sliding roofs, noticing the Canterbury Hall, where a roof 36ft. by 18ft. was made to open laterally for purposes of ventilation, and the Paris Circus, where a roof, 17ft. by 57ft., divided in the centre, opened longitudinally by the half portions sliding in opposite directions. The roof over the Royal Observatory of Vienna was alluded to as an example of a revolving dome of 42ft. diameter. The Albert Hall was interesting as elliptical in plan, dome-shaped, and producing no horizontal thrust, the feet of the ribs radiating from the centre of the figure, and being tied in at the wall-plate, which is continuous all round. The roof is 219ft. by 185ft. across.

The proper way to calculate wind-force was to estimate the effective normal pressure on the various bays in a roof. In providing for expansion, it is more economical to fix the roof on the leeward side, and leave it free to expand on the windward side. In the Cannon-street Station roof the connection over the rollers is hinged, to obviate the effect of vertical wind-pressure depressing the roof, and producing unequal strain on the rollers. The merit of rollers may be much disputed, as they are often found to rust in their bearings. In the Earl's Court Station roof, which consists of two inverted queen-post trusses, with vertical members braced together, the wind bracing is confined to the two end bays, the lateral stiffness of the intermediate bay being secured by their purlin connections, which are here placed vertical, it being considered that the dead load and weight of snow act vertically. It was unnecessary to spread the wind ties in all directions over a roof if certain bays at intervals are secured. The author proceeded to describe the best means to prevent corrosion, and the importance of all parts of a roof being accessible to the painter's brush.

PHOTOGRAPHS BY AN ARCHITECT, FROM WORCESTER, HEREFORD, SHREWSBURY, AND CHESTER.

FEW towns could be named as possessing more choice examples of Old English half-timbered buildings of equal practically suggestive character to the architect than Worcester, Hereford, Shrewsbury, and Chester. Photographs illustrating some of the more notable of these specimens must, therefore, be of more than

ordinary interest, specially when taken entirely from an architectural point of view. A visit to the Royal Architectural Museum at Westminster will repay the reader who may care for illustrations of this kind, inasmuch as a collection of about 140 photographs from the above-mentioned places is now on view there. The prints are all carefully named, mounted, and numbered. The greater part of them show the numerous Courts and Manor Houses, as well as abbeys and churches, visited by the Architectural Association excursion party in August last, whose trip we have already described. The remainder illustrate similar buildings seen by Mr. J. L. Robinson, of Dublin, when continuing his autumn holiday after leaving Worcester-shire, and we may here say that to this gentleman is entirely due the whole series under notice, which, although taken for his own use chiefly, have been kindly placed at the disposal of the excursionists in order that they may obtain copies. Glancing at the sheets as numbered we have, in groups 1 and 7, a very complete set of studies of Worcester Cathedral, showing, not only the new work of Sir Gilbert Scott in the choir, and Mr. Perkins' restorations throughout, but also the untouched details of the Refectory, Guesten-hall, and Elgar Tower. Prince Arthur's more than lovely chantry-chapel in the choir is also carefully illustrated, giving each ornamental feature in every minute particular. The half-timbered remains in Lich-street, Friar-street, and New-street; the Guildhall and Worcester Commandery-hall are likewise grouped on the sheets 7 and 8. Turning again to numbers 1 and 2 we have remarkably good views from the highly-interesting court-house of Severn End, with its quadrangle-like wings in brick on the entrance side built by Judge Lechmere in Queen Anne's time, and its earlier timber gables on the garden front; the garden-house and unique old chests there are also illustrated with some useful details of a veritable "Queen Anne" door in stone having a pedimented head and cushioned frieze. The same page includes the fine square tower of same date from Hanley Castle Church hard by. The old stone house of Woolas Hall figures well from several carefully considered points of view in set No. 3, which same sheet is graced by two large portrait groups of the Excursionists. Huddington Court House and the much neglected, but beautiful, little 14th-century church at the same place have some four or five good views recording their ancient time-worn condition, and on this account are all the more interesting to the student as well as to the antiquary. The Pershore Abbey photographs admirably comprise the several periods of its architecture both inside as well as out, not forgetting the unfrequented parish-church adjoining. Tewkesbury also has been well recorded, some of the best of Mr. Robinson's photographs being from this place, notably prints 70 and 71, giving architectural details from the roof of the big central tower, almost in line elevation; and the unique Norman west pinnacles or towers. Members will also be glad to have secured to them a portrait of the verger here and also some timbered "bits" throughout the town. Norton Manor House Gateway (No. 83) is among the present most successful examples, as it was the only erection of its kind seen on the Excursion. Of porches there are several views, including Mr. Street's new one in timber at Hanley Castle (65), the old ones at Huddington, both from the Court House (82) and Church (87), the debased-charactered one at Mere Hall (90), with a valued portrait of the host, and Mr. Hardwick's well-designed entrance at Newlands, 101. The larger and somewhat pretentious gatehouse at Westwood is more than once given, and the mansion itself is the fit subject for three or four views, embracing in some the garden-houses. An interior or two gives the big gallery and staircase, while the really most valuable part of the building, architecturally considered, is beautifully photographed in print 21, which gives a detail of the entrance porch. Maddresfield Court, the seat of Earl Beauchamp, is photographed from both sides, and No. 103 in a too small view, records a parting glance at Mr. Norman Shaw's characteristic entrance lodge to the same grounds. The iron work at Mere Hall and the Queen Anne summerhouses, 91 and 92, are even more interesting than the quaintly timbered mansion itself, 19. Both Great and Little Malvern are by no means overlooked; the

peep of the towers in each instance, the former from over the Pool (105) and the latter from the manor-house grounds (107), being specially pretty. The timbered Court-house at Salwarpe has three good photographs 100, 101, and 102, the best being the foreshortened view second named. Ledbury, one of the last places visited, occupies a good space of group sheets, 5 and 12, where the church both inside and out, the market-house, and grammar school are more than once given.

Hereford Cathedral, from the S.E., obtains a fine view No. 39, but the detailed photographs, showing the north porch, the cloisters and the market house, are more interesting. A general view of the building from the south-west is given with the river in the front, and the singular groining of the porch is illustrated by Plate 126. Chester contributes several views, showing Sir Gilbert Scott's work of restoration at the Cathedral, and well illustrates Mr. Blomfield's schools. Of half-timbered work, several old examples are of course included, and none the less interesting are two specimens of modern Chester work in this style of building. We refer to Mr. John Douglas's really clever cocoa-house, built two or three years ago, and illustrated by us at the time, and some houses next a well-designed church in the Grosvenor-road, by the same hand. Mr. W. H. Lynn's Town hall comes out abruptly in View 40, the new markets adjoining by the same architect, just being included in the Plate. Of the old Rows No. 30 gives an elevated prospect, and includes the hardware warehouse, with its oversailing timbered gable, built we believe from the designs of Mr. T. M. Lockwood, of Chester. The old rough-east houses at the corner of Shipgate-street figure in No. 30 with the elaborately-detailed front of timber under one wide gable near the bridge.

The Grammar School and the massively-arcaded Market-house at Shrewsbury, which have been the source of inspiration for more than one recently-conspicuous design, form the very interesting subjects for photographs 31 and 117. The uncomfortable way in which the arches of the Market-house come upon the eaps is very unfortunate. Else the building presents a suggestive type of a design for modern uses, and our regrets that a small photograph only was on this occasion devoted to its illustration. The Feathers Hotel, Ludlow, and some other old timbered houses are given, as well as a charming photograph of the south porch from St. Mary's, Shrewsbury. This well-known church is also given by a general exterior view (32) and by an interior (33) looking east, showing the fine open arcaded wall-space over the chancel arch, and the curious semicircular arches of the nave arcade of Late Early English date. The singular way in which the large roll corbels back on to the pier eaps is specially worthy of note, the effect as seen in perspective being rather good. The west front of the Abbey is illustrated by print 116, and the timbered church of Besford, as restored by Mr. Hopkins, is not forgotten, a view from the north-west being recorded by photograph 85. The collection of photographs we have thus briefly enumerated will be on view during the next fortnight at the Museum in Tufton-street, Dean's-yard, Westminster. Admission free.

THE "LOUGHBOROUGH" BOILER.

MESSRS. MESSENGER AND CO., of Loughborough, have just brought out a new boiler for heating greenhouses, harness-rooms, coach-houses, coils in halls, &c., which is worth attention. The advantages claimed are that no heat is wasted, the boiler standing in the house, the whole of the heat from the boiler itself is utilised; economy both in first cost and maintenance; there being no brick setting or iron casing required; and consequently none to get out of order. Not being set in brick-work, or attached to the freehold, it forms a "tenant's fixture." No stokehole is necessary; the front of the boiler being flush with the greenhouse, and on the level of the ground. It may be fixed either in the brick or boarded front of a greenhouse, and is absolutely safe from risk of fire. Being on the slow-combustion principle, it is very economical in fuel, and no night-stoking is required. The joints to the hot-water pipes are put together with elastic rings, and can be fixed by any handy person. The hot-water pipes are connected immediately to the sockets of the boiler, so that the necessity

for mains is done away with, and the pipes circulate through an open-feed siphon fitted with a lid, so that there is no need for any siphon and supply-pipe. Simplicity has been

studied in all such parts is these, that an efficient apparatus may be produced cheaply without sacrificing any essentials, or the quality of the materials. The fuel consumed is 16lb. in 12 hours, and the apparatus is capable of heating, including the boiler itself, the equivalent of 4000 ft. of pipe.

PRACTICAL NOTES ON PLUMBING.—
XVI.

By P. J. DAVIES, H.M.A.S.P., &c.

TRADE MARK.

DAVIES' PATENT SELF-CLEANING POT TRAP (FOR LEAD PIPE).—FIG. 95.

THIS trap, bearing my name and being my own invention, it is just possible that I may be charged with egotism for recommending

it. I think, however, those who test its qualities will agree with me that it is one of the best and most simple traps yet introduced to the trade, both on account of its self-cleansing properties and its cheapness.

It can be made, as shown, with a rounded bottom B, a piece of lead soldered on to the bottom as a flange. It will be found very convenient for fixing under "Smith's" or "Shank's" cast-iron baths. I is the inlet which may be a piece of, say, 2in., about 2in. long, which in many cases only a 1in. pipe is required. W is the waste-pipe, which for "Smith's Bath" should be 1 1/2 in., and can be soldered within 2in. of the bottom, as at S, and fixed to the S plug as per dotted line D, then fasten up in the usual manner. It will, of course, be understood that when this trap is in use, the water level is as shown, and the trap and outlet are kept clear in the usual manner. If the trap is used for washing-basin or sink, the trap and outlet should be fixed in the wall, which is a trap, ought to be selected for its purpose, and the bottom of the pipe or trap should be a flange as shown at the bottom.

I have also shown a diagram of this trap in a cross-section, showing the matter of the trap and outlet being kept clear by the action of the water level, and the outlet W.

SOAP-TRAP (Fig. 96)
Represents the so-called soap-trap, which has long been used for washing-basins.

The first made to this pattern was in 1863, made and fixed by myself at 19, Portman-square, London. The following is the mode of

construction: B, the body 2in. pipe; I, the inlet and dip pipe, soldered to unit; O, the overflow-pipe soldered on at A; W, the waste-pipe soldered on at D; C, the cleansing-cap and screw.

In fixing all traps of this description (or, indeed, if the truth be told, any traps that are required to be self-cleansing) always fix them not less than 18in. below the washer and plug of the basin or strainer of the sink. Then if the washer and plug, or grating, is large enough to admit sufficient water to fill the pipe full bore, the weight of the water falling upon the bottom of the trap will send all sedimentary matter before it. I have fixed these traps upon the floor-line, in order to get a good fall from a washing-basin, and for the purpose of cleansing it out, fixed the cap and screw, C, on the side or in front.

OVAL LIP TRAP (Fig. 97).

The principle of the oval lip trap is very similar to that shown in Fig. 95,

except that in Fig. 97 there is the lip L, answering the same purpose as that marked by the dotted line D in Fig. 95. The following is an explanation of Fig. 97:—C is a cap and screw; W, the outlet or waste-pipe; I, the inlet; S, the water-line and seal; B, the oval body. Thus, as a small trap, is very useful, and will answer every purpose where plenty of water-seal can be given.

STRAIGHT FIG. 98. OV. LIP TRAP

Is the diagram of the straight oval lip trap, which works on the same principle as the last described, the only difference being that the outlet W of this trap is made to run in a line with the inlet I, answering the purpose of A.

Fig. 99, and A, Fig. 88. L is the lip to prevent the gases passing from W to I, and R the lip for holding the water. It will at once be seen that if this trap is fixed upside down it is exactly the same in action.

BALL-TRAPS.

Seeing that of late much has been said, pro and con, as to the merits of ball-traps, I presume I shall not be out of order in saying that, after many careful experiments, I fail to see in what way they are useful, excepting in some isolated cases where traps become dry or lose their water-seal.

Following I give you specimens of these traps, with the most simple methods of making them:—

Fig. 99 represents one of these traps as I made them many years ago, and is very easy of construction. A is a piece of 2in. lead-pipe,

worked over so as to receive the pipe I, which may be the inlet or outlet. This pipe is first shaved clean, then dropped through the flanged part F, and, with a turn-pin, opened a little, as shown at E, to receive the ball about one-third. This forms the seating, which must, of course, be true. Solder the joint at F. Put in an indiarubber ball (hollow if you choose, but if you can get a pure rubber solid ball it is better, as pure indiarubber always floats), wrap the ball in four or five thicknesses of tissue-paper, or even more; then work over the bottom flange G and fix the pipe W, which can afterwards be bent to the trap, as per dotted lines. If you wish the ball to float, you must take the pipe up high enough accordingly; on the other hand, if you require the ball to be at all times independent of floating action, you must turn the trap upside down and load the ball. In this case, you will have to form your trap in the pipe I, and can take the outgo off the side at H. In fact, this ball-trap can be worked in almost every conceivable way.

Fig. 100 is a simple ball-trap, as shown in

one of my patents of 1876, attached to the overflow of a valve-closet. This trap, which is

shown upside down, is made as follows:—It was cast in one piece, as also the pipe I, but straight; this had the seating S cast upon it. It was cast in a mould something like a Coumburge mould, the ball dropped in, and the trap sometimes soldered at J with a copper bit, &c. If the ball were required to float, a light ball was used, the pipe, I, left straight and the other way up; but on the other hand, if the ball is too heavy to float, the trap is formed in the pipe I.

In any case I is always the inlet.

To understand the action of these traps, suppose the pipe W, Fig. 99, to be bent up as shown by the dotted line D; that is above the ball-seating. It will be seen that water would lie in the bend and form a trap; consequently, if the ball is lighter than the water it will float, and as a further consequence, be forced up against the seating E, according to its buoyancy, and thereby cutting off all chance of sewer gases passing through this pipe. When the water is set running down the pipe I on top of the ball, it will send it whirling away from the seating, but when released from this pressure, it naturally again rises to its original position.

Now turn the trap upside down and bend the pipe I, as you did W, so as to form a trap, and wipe in the stump out-go H, so that the ball will be above the water-line. Now the action of the ball will be reversed, inasmuch as the ball will of its own gravity close the seating, and thus cut off all gas from passing between I and H.

MR. BUCHAN'S BALL TRAP.

This trap in principle is the same as the last described; but, as shown at T C, has a cap and

screw, also at C and the vent-pipe A. The manner of making this trap is the same as described in reference to Figs. 99 and 100.

POWER TRAP (Fig. 102).

The Bower-trap has lately had some little run upon it, which I imagine is owing to it having

been "pushed" into the market; but, be that as it may, the following is the description of it.

The top part, I E and W, is cast in one piece of lead, and the bottom C is made to screw on at F. C is generally made of glass, which I venture to suggest is very much against the efficacy of the trap, as under extreme temperature of either heat or cold (for instance, careless persons throwing down hot water in very cold weather) glass is very apt to break, and the glass once broken the trap no longer exists.

The shell of this trap possesses no advantages over Fig. 96; neither is there any superiority in the trap, if a small, solid india-rubber floating-ball is dropped through the cap and screw, and the overflow-pipe O branched into the pipe I.

(To be continued.)

THE NEW SCHOOL-BOARD OFFICES IN LEEDS.

LAST week the Leeds Board-School held its first meeting in the board-room of the new building, which has just been erected in Calverley-street, from plans prepared by Mr. George Corson, architect. The structure is in the Palladian style, freely treated. The principal entrance is in Calverley-street. Carving has been employed in adornment, and this front, with its fluted pillars and pilasters, its Corinthian capitals and detail work, its cornices and balustrading, and its lofty pavilion, is harmonious in design and treatment. A similar remark will apply to the Great George-street façade, though it is not so ornate, the pilasters being plain. The requirements of the site necessitated this side being broken up. It has been skilfully managed, the pavilion at the end being brought forward and made a prominent feature. The basement is rusticated, and is built with stone from Burley-in-Wharfedale, the superstructure being of Pool Bank stone. The frontage to Calverley-street is 65ft.; to Great George-street 119ft., and to Alexander-street 126ft. The building is arranged in three floors—the basement, which contains offices for the attendance officer, store-rooms, care-taker's house, heating apparatus, meter-rooms, &c.; the ground-floor, on which are the board-room, the committee-room, and general offices; the first floor, on which there are large and small examination-rooms, and private rooms for the use of the members of the board; on a partial fourth floor are cloak-rooms, lavatories, and store-rooms. A double staircase of stone, approached on one side from Great George-street and on the other side from Alexander-street, gives access to the whole of the floors. The object of this arrangement is to afford separate entrances for males and females to the different examination rooms.

Entering by the principal doorway in Calverley-street, it will be noticed that in the jambs of the archway are carved full-length figures, emblematical of School Board work. They represent a boy and girl on their way to school. The work has been executed by Mr. Matthew Taylor, of Leeds. At night the entrance is closed by a wrought-iron gate, which descends during the day into the basement. The main corridor, which is 10ft. 6in. in width, and 18ft. 6in. in height, runs the entire length of the building, and joins the corridor through which access is obtained by the door in Great George-street. It is treated architecturally. The walls are built with ornamental and plain bands of terra-cotta, and divided into bays, with moulded and fluted pilasters. The ceiling is arched, and divided into bays with pannelled ribs, and the floor is tiled. The corridor is lighted with wrought-iron lamps, suspended from the centre of the vault. The first room on the left of the corridor is the Board-room, which is 48ft. 6in. by 22ft. 6in., with a height of 20ft. It is lighted by two windows in Calverley-street and three in Great George-street. These are glazed with double sashes, in order to prevent the business of the board being interrupted by the noise of passing vehicles. The room is pannelled to the height of 12ft. in black walnut. Above a bold dado are plain panels, and at the top is a handsomely carved frieze containing shields, some of which bear the names of the chairmen of the board, the dates of the election of the different boards, the date of the passing of the Education Act, the name of the architect, together with the date of the commencement and completion of the building, &c. Several of the shields are left blank, and will be

filled up with the names of future chairmen. At the top of the panneling on the side facing Great George-street there are three arched recesses, and within these are three brackets intended for busts. At the east end of the Board-room is a gallery, capable of containing about sixty spectators, access to which is obtained by a staircase from the main corridor. Under the gallery is an ante-room for the use of the members or for deputations in waiting, and in connection with it there is a lavatory and cloak-room. On the right-hand side of the main corridor, occupying a corresponding position to the Board-room, is situated the committee-room, which is 23ft. 6in. by 20ft., and the same height as the Board-room. The chimney-piece is of good design. It is formed of St. Anne's marble and black walnut. In the upper frieze are figures emblematical of the Four Seasons. These have been modelled in Doulton ware by the artist, Mr. George Tinworth. At the east end of the building the double staircase is situated, by which access is obtained to the examination-rooms. The principal examination-hall occupies the entire width of the Calverley-street frontage, and has standing accommodation for about a thousand persons. It is 69ft. wide and 73ft. long, and the height to the crown of the arch of the roof is 43ft. At the west end of the hall is a raised and railed platform, and at the opposite end is a gallery which will accommodate about a hundred people. The hall may be described as a nave with narrow aisles, divided into bays having detached cast-iron pillars carrying the arched ribs of the roof. The ceiling is of pitch-pole, and is divided into panels with moulded ribs. The hall is lighted by top-light windows on three of its sides, and for night there is a large sunlight in the centre and three-light brackets round the dado. It is intended to use this large hall for examinations, for exhibitions of the works of the children, for scientific lectures, and for educational work of various descriptions. A private staircase is provided in close proximity to the platform. It is in direct communication with the committee-room and clerk's office, and is intended for the use of members of the board or lecturers. At the south-east end of the large hall is a smaller examination-room, 45ft. by 24ft., which will be devoted to examinations and sectional lectures. On the top floor are several store and classrooms. In the basement-floor there are a number of well-lighted store-rooms. There is a receiving-room, into which all the boxes are taken from the wharries outside. They are there unpacked, and lesson-books, copybooks, slates, pens, pencils, ink, &c., are stored in a suite of rooms adjoining. The demands of the different schools for books, &c., are sent to the offices every Friday, and the parcels are ready for delivery on the following Tuesday. The scheme of ventilation has received careful consideration. A hot-air furnace, situated in the basement, is connected with every room in the building, either by flues formed in the walls or under the floors. Fresh air is also admitted independently, so that there is a continual inflow and outflow of air. Generally speaking, each department is treated, with respect to gas and heating arrangements, as a separate building, which can be dealt with entirely independent of the others. The fumes of the gas are carried into the foul-air flues. The building is fireproof throughout.

The work has been executed by the following Leeds firms:—Messrs. Wm. Wilson and Son, bricklaying and mason work; Mr. Britton and Mr. James Wood, carpenter and joiner's work; Messrs. Braithwaite and Co., plumbing and glazing; Mr. J. P. Mountain, plastering; Mr. Rawlins, slating; Messrs. Wood and Sons, painting; Messrs. Jackson and Co., decorative work; Messrs. Cooper and Dawson, fireproofing; Messrs. J. and L. Horsfield, wrought-iron roof work; Mr. Jos. Bedford, cast-iron work; Mr. J. Lindley, sunlights; and Mr. Benjamin Paler, stone-carving. The tile work has been executed by Webb's Worcester Tiles Company. The ornamental wrought-iron work, gas-fittings, locks, &c., have been supplied by Messrs. Chas. Smith and Sons, of Birmingham. The total cost is under £21,000.

The Kensington vestry decided at their last meeting to rebuild the bridge over the canal at Kensal-green, in accordance with plans prepared by Mr. Vignoles, engineer.

LITTLE HOLLAND HOUSE, KENSINGTON.—SOUTH PORCH AND DETACHED DEPENDENCY, ST. MICHAEL'S, BECCLES.—HOUSE AT BATTLE—WESLEYAN CHAPEL, HOLLY PARK—TAVERN, ROYAL ALBERT DOCK.

OUR LITHOGRAPHIC ILLUSTRATIONS.

LITTLE HOLLAND HOUSE, KENSINGTON.

Our Little Holland House being pulled down, where Mr. Watts had established himself for upwards of twenty years, he engaged the late F. P. Cookerell in 1871 to design him a house, which he had built in Melbury-road, and gave it the title of his old habitation. The new house, which covered a site of about 80ft. by 46ft., was, like its owner, unpretending and mostly devoted to work, for besides the kitchen and servants' departments there were only two bed-rooms and a sitting-room, but there were four studios and a lumber-room for artists' properties, and even these four studios did not suffice, for an iron studio was afterwards added in the garden. The house, though unpretending both inside and out, was not without some signs of Cookerell's artistic hand, and of his resources in planning. A screen, a baluster, a wood chimney-piece, or a moulding told the practised eye that an artist had been at work. But gradually the studios were filled with canvases and properties, and in 1879 Mr. Watts determined to rearrange his house, to build a picture-gallery and a porch, a lumber-room for his sculptor's models, and a look-out from the basement, from which he could see his sculpture at a proper level. He engaged Mr. G. Atchison as his architect, under whose directions the small studio by the entrance was turned into a waiting-room, and the west end of the house a picture-gallery was added, about 58ft. by 24ft., to which the waiting-room and a lumber-chamber. The roof of the picture-gallery was made wholly of glass, so that no wall-space might be lost. The double studio on the first-floor was turned into one large studio, about 14ft. by 24ft., with a recess at one end for canvases and at the other for colours and properties; the gallery was shifted from the south side to the east end, a porch was built to the front door, and a few minor alterations were made. Mr. Watts has thrown open his picture-gallery on Sunday afternoons, and the public may now see some of those masterpieces of art which have added a lustre to the British school, the "Orpheus and Eurydice," "Cleopatra and Antony," "Diana and Erycinus," the portraits of the distinguished men and two women of the day portrayed with that authority of observation and that insight into character that his sketches his work; his portrait of his wife, his sketch of a man in common life, and the sketch of a woman, his fancy has depicted the countenance of an arch and of a temper, cloud, or forest, and perhaps some landscape in the garden of his house, and the sketch of the first Fair Ground, and the sketch of the Welsh marches.

ST. MICHAEL'S CHURCH, BECCLES, SUFFOLK.

THE church of St. Michael is a very fine Perpendicular building, of which the south porch and belfry are the most conspicuous features. The porch, which is still very rich, must have presented an exceedingly elaborate appearance when the numerous niches were full of sculptured figures, and the greater part of the work was painted and gilt—no traces of which now remain, though it is on record that a few years ago a great quantity of lapis-lazuli was scraped from the niches. The majority of these niches are enriched with an imitative groining, which is so minute as to require very close inspection; no doubt these portions were brought out more prominently by the judicious application of colour. The bell-tower, which stands on the south side of the church, near its east end, was commenced in 1500, but never finished, probably owing to the dissolution of Bury Abbey. The lower portions of the tower are somewhat dilapidated, though the structure generally is in good preservation. Owing to the way the churchyard is surrounded by buildings, the accompanying view is the only one that can be obtained, showing the whole of the tower.—W. H. W.

HOUSE AT BATTLE.

This house is in course of erection near Battle. It stands on an eminence, in a well wooded country. The materials are brick, stone, and timber. The work is being carried out from the designs and under the superintendence of Mr. W. H. Oakley, architect.

WESLEYAN CHAPEL, HOLLY PARK, CROUCH-HILL.

This building, tenders for which appeared in the BUILDING NEWS on 6th May last, is now in progress. The nave is octagonal, an aisle being carried round it, except at the eastern side, where a chancel is formed. The benches are arranged so as to face the pulpit, the passages to these in the aisle being in the shadow of the columns, so that there are no seats from which the preacher cannot be seen. The slope of the ground necessitating an ascent by steps to the nave floor, a porch was formed on the ground level under this floor at its western end. A north porch gives access from a side road to the chapel without steps. Provision is made for a gallery, which can be added whenever required, and will be carried on segmental stone arches springing from the nave piers. Without the gallery, the accommodation is for 650 persons, and with it for 1,000. The materials used are red brick and Bath stone. These will appear in the internal facing also, as the walls are to be unplastered. A wooden vaulted ceiling will cover the nave, the aisle and chancel ceilings being panelled, and the space thus gained between ceiling and roof will be used for ventilating purposes. Air will be admitted through vertical flues formed in the external walls, and will be extracted by ventilators in the ceiling. Messrs. Perkins' hot-water apparatus will be used for warming the building. Messrs. Lathey are the builders, and Mr. E. Hoole, of 30, Russell-square, the architect.

TAVERN, ROYAL ALBERT DOCK.

Our illustration shows one of the taverns proposed to be built at the Royal Albert Dock by Mr. W. H. Lascells, Bunhill-row, from drawings by Messrs. Vigers and Wagstaffe, for the London and St. Katherine Dock Company. The walls of basement are to be of cement-concrete, faced on both sides with Potter tiles. Above this the walls are to be brick, and the roofs covered with plain tiles. The bay-windows, caryatides, consoles, cornices, &c., are to be of Mr. Lascells' concrete. Our view is taken from the drawing in this year's Royal Academy Exhibition.

Staff-Paymaster Wethered, of the Royal Artillery, Woolwich, has invented a simple form of fire-escape, which was tried before the members of the Derby Corporation and fire brigade on Saturday. It merely consists of a rope, to be attached firmly inside the room from which escape is contemplated, and a handle and swivel loosely attached to it, with bands to support the body of the person descending. The cost was stated to be £1, and the experiments are reported as having been successful.

A barrow on Blandford Road, Dorset, was opened last week and disclosed several skeletons.

UNIVERSITY COLLEGE, LONDON.

THE programmes of classes for the study of Architecture, Construction, and Modern Practice, at this College, under Professor T. Roger Smith, F.R.I.B.A., have just been published. Three courses of evening lectures are to be given during the session, at the College, Gower-street, the aim being to render the lectures useful to students preparing for the Associates' examination at the Royal Institute of British Architects, or the district surveyors' examination, as well as to pupils and other students of architecture. Course A—Architecture as a Fine Art (about 30 lectures, on Mondays, at 6 p.m.): "An outline of the leading peculiarities of the principal styles of architecture," historically and analytically treated. In each session some lectures will also be devoted to a fuller examination of "the special characteristics and history, the mouldings, features, and ornaments" of some one style. Greek architecture will be so treated in the coming session. Course B—Construction and Materials. (About 30 lectures, on Tuesdays, at 6 p.m. The first week in each month on Wednesday.) "The nature and properties of building materials, including their decay, preservation, quality and strength, and their application to building. The principles of construction, as applied in practice to foundations, walls, arches, vaults, roofs, floors, and partitions. Drainage, sanitary arrangements and requirements. The application of formulas for calculating the strength of materials. Shoring and underpinning; and dealing with ruinous and dangerous structures." Course C—Modern Practice. (Not less than 15 lectures, on Tuesdays, at 7.10 p.m., except the first week in each month.) "Planning for special purposes and sites. Specifications and the mode of estimating cost. The general conditions usually appended to a building contract. Quantities. The conduct of works. The adjustment of accounts. Professional charges. The London Building Act. The modern by-laws. Light and Air. Litigation. Arbitrations. Professional evidence. Dilapidations. Surveys. Valuations. Miscellaneous professional duties." A public introductory lecture, explanatory of the course and with suggestions as to modes of study, will be given at the College, by Professor Roger Smith, on Monday next, at 6 p.m. Admission free, and without tickets. Architects and students of architecture are invited to attend.

CHIPS.

The rural sanitary authority of St. Austell, Cornwall, adopted on Friday plans by Mr. John Samble, for a water supply for Mevagissey, and resolved to apply to the Local Government Board for sanction to borrow £1,150 to carry the scheme out.

A double gas-holder, 86ft. by 24ft., and a single gas-holder, 56ft. by 24ft. 6in., are about to be constructed for the joint gas committee of Denton and Haughton, near Manchester. The engineers are Messrs. Veevers and Wharm, and the consulting engineer is Mr. Harrison Veevers, of Dukinfield.

The School-board of Barton St. Mary, Gloucestershire, have accepted the tender of Mr. Nicholls for the erection of a new school. Mr. Moore, of Barton, is the architect.

The Holborn board of guardians, at their last meeting, instructed Mr. H. Saxon Snell to prepare plans for a new swimming-bath at the boys' school, the cost to be about £350.

The Chapel Royal in Prince's-place, North-street, Brighton, is undergoing restoration and enlargement from the designs of Mr. R. W. Blomfield, M.A.

The town council of Bolton have resolved to apply for Parliamentary powers to construct works in connection with the brooks and watercourses feeding the Entwistle and Weych reservoirs; the construction of filtering-beds at those reservoirs; the borrowing of £100,000, and the extension of water supply limits.

At Dundee gasworks on Wednesday week a new gasometer, the second in size in Scotland, was formally brought into use by the provost. It is made on the telescopic principle, rises to a total height of 150ft., and is surrounded by eight iron pillars, each 3ft. in diameter and 62ft. high. The cubic capacity is about one million cubic feet. The tank was constructed by Mr. Councillor Gentle, of Dundee, and the gasometer by Messrs. Clayton, Sons, and Co., Hunslet, near Leeds; the total cost was £17,000.

KETT'S PROVINCIAL PRICE-BOOK.*

PRICE-BOOK, for the use of architects and builders in the provinces, has long been required. The present excellent prices are prepared and published in London, as Mr. R. Beckett, the author of this publication, says, they are generally inapplicable to provinces, "where not only the definitions of modes of measurement, but still more, the rates, differ widely from those prevailing in metropolis." All those who have practised in the provinces will endorse these remarks, and especially architects and surveyors in the North of England. One qualification, if it be one, which the author of this price-book possesses which cannot be claimed by the compilers of other books of this class, is that he is a contractor and builder of practical and lengthened experience in Cheshire, and as such ought to be the best judge of the requirements of the trade. Looking at the performance of the work, we can only say that the author has carried out his task in a practical manner, and has endeavoured to promote uniformity in the measurement of work and the pricing of work by prefixing to each trade the rules recommended by surveyors, and giving the particulars of prices. The methods of measurement have been extracted from those recommended by the Manchester Society of Architects and by the master builders of Yorkshire. If, for example, we take the carpenter and joiner, the rules for measurement are clearly stated in 66 different items, each numbered. The first of these states that "unless a special provision be made that timber and joiners' work must finish nett to the dimensions given (the waste being calculated then in the price), it must be understood that all work will follow the original marking or 'pricking' for sawing; thus each sawn face would reduce the scantling by nearly 1-16in., or half the width of saw-cut, and each wrought face would entail a further reduction of about 1-16in. A 12in. by 6in. scantling would thus measure 11½ by 5½ in full, and a 2in. door would finish 1½ in. full. With respect to measuring the labour of principals, the rule is given that the labour framing is to be measured, the length or span with wall-hold, separating the different kinds, and the framing of trussed partitions the same. Some of the rules will be found to differ from those adopted by London and Southern surveyors, but they are at least reasonable. The prices for carpenter's work are headed by the price of timber in logs at seaports, the Baltic red being put at 1s. 4d. to 1s. 7d. per cubic foot; pitch-pine 1s. 7d. to 1s. 9d., and yellow pine 1s. 9d. to 2s. 6d. per foot. Yellow pine deals and battens are priced at £15 10s. to £23 per standard of 65 cubic feet, and red wood, £10 10s. to £15 10s. After this an analysis of the cost per cubic foot, including carriage and cartage, sawing, profit, and waste risks, interest, &c., is furnished, which is summed at 2s. 9d. per foot, without labour. These preliminary calculations are a useful guide to the provincial surveyor and builder, as he can then adopt the cost of materials and labour of his own locality, while the calculation gives the basis of the prices which follow. The classification is clear and easily read, and the prices follow in a natural order, beginning with timber in bond lintels, roof-trusses, and then the labour and nails only in flooring, joists, partitions, roofing, &c. Perhaps the most generally useful price list, and that repeatedly referred to, is the joiner's. That here given is clearly and distinctly arranged in columns, and under the usual headings, sufficient for all ordinary requirements. The floors and various descriptions of skirtings, doors, windows, and architrave mouldings, are readily referred to according to their several thicknesses, heights, No. of panels, girths, &c.

The mason's trade is treated in the same full and explicit manner. There are several methods of measuring stonework: one being to take out all the labour upon it, and another to include material and labour, but separating the items according to the kinds of labour, and in nearly every locality some particular usage prevails. By Mr. Beckett's method, the stone and labour are kept separate. Plain ashlar walling and parapet is measured super. nett work for "stuff and work,"

giving the kind of face and average sizes and bed of the stones. Again, No. 14 rule states, "in measuring the labour, the necessary operations of the workman to be followed. The beds and joints of each block to be measured and kept under that head; and it will conduce to more easy pricing of the work when these can be given in lineal feet with the average width, particularly for strings, cornices, architraves, jambs, &c." No measuring requires more practical acquaintance with the method of working than that of stonework. Each operation must be taken into account, and minute division is necessary. Full directions for measuring that most difficult of all operations, "labour" are given, and the lineal feet measurements are specified. A table of approximate prices for stone at the quarries, with the several kinds of labour upon it, is compendious and useful. We find in the bricklayer's rules, that "cavity walling" is directed to be measured the actual thickness of the bricks, and the superficial dimensions of wall measured across all openings under 100ft. square as "extra labour and materials for bond forming cavity." This is a mode usually followed by good surveyors. The prime cost of bricks, labour, mortar, scaffolding, profit, &c., is priced at 4s. 5d. per yard of one brick length walling. Many useful data and directions follow this and other trades, such for example as Minton's directions for laying tile floors; Craven's method for keeping them clean, cleaning cement off brickwork, &c.

A large portion of the book is taken up with printed matter of a generally useful kind. The Employers' Liability Act, 1880, is given in full, and will be found of value to contractors, after which follow the sections and schedules of the Liverpool Building Act, 1842, which may be taken as a well-studied code of building regulations, and upon which others have been based. The by-laws as to new buildings, &c., in force in Manchester; the rules and instructions respecting parsonage houses required by the Ecclesiastical Commissioners and the Governors of Queen Anne's Bounty, and the form of contract agreed to by the R.I.B.A. and National Association of Master Builders, will be found serviceable. Tables of timber measure, and a wages table on the hour system, besides the usual summary of stamp-duties, are given, and a few useful notes on disinfectants, and several recipes, including remedies for damp walls, &c., are appended to the work. Mr. Beckett has striven to meet the general wants of provincial builders, architects, and surveyors, and if his work serves in any way to establish a more uniform mode of measuring and valuing builders' work, his labour has not been thrown away. A good price-book is a valuable aid to the provincial builder in enabling him to take contracts upon a fair measure and value schedule, and we believe if buildings were undertaken on a just method of measurement, and the prices were regulated by a proper estimation of the cost of materials and wages, a more just and equitable system would take the place of modern contract work, and its pernicious results.

THE BRISTOL AND CLIFTON JUNIOR ARCHITECTS' SOCIETY.

THE first half-yearly meeting of this Society has been held at Rupert Chambers, Rupert-street. Mr. John C. Moncrieff (vice-president) presided. Messrs. George E. Ford and Wm. E. Hill (hon. secs.) presented the report as follows:—"In presenting our report of the first half-year's proceedings of our society, we deem it advisable to give a brief history of the society, so that its position here to-night may be fully understood. Our society was first instituted on February 8th of the present year, and the following gentlemen composed the preliminary committee:—Messrs. Cridland, Fawn, Fudge and McPherson, with Messrs. G. E. Ford and W. E. Hill as honorary secretaries. The first meeting of the committee was held at 31, Clare-street, by the kind permission of Mr. W. L. Bernard, and Mr. C. F. Hanson, F.R.I.B.A., was chosen president, and Messrs. W. L. Bernard and J. C. Moncrieff vice-presidents. The thanks of the members and committee are due to these gentlemen for so readily consenting to fill these offices. The secretaries deemed it advisable to obtain a list of patrons. The programme of the society contained in its

list of patrons no less than 14 noblemen and gentlemen. This list, however, we have now increased to 32, which comprises six peers of the realm and other noblemen, members of Parliament, &c. The list also includes the President of the Royal Institute of British Architects. Since the first meeting of the society at All Saints Church, on March 12th, meetings have been held and visits taken place at various times. During the months of March, April, May, June and July we have held eight evening meetings and 15 Saturday visits. Lectures have been given during the session by Mr. Henry Masters, on "Sanitation;" by Mr. J. C. Moncrieff, on "Art;" and by Mr. W. E. Hill, on "Apprenticeship." The committee have observed with much pleasure the interest taken in these meetings and lectures by the members, but regret to add that the attendance of the local professors of architecture had been so small—indeed, they were conspicuous by their absence. But we feel sure that by arranging an attractive programme for next session this discouraging feature will be removed. Prize competitions have already been started amongst the members, and the committee appeal to the members of the profession for donations to the prize fund. The pleasure we have taken in the progress of the society has been somewhat marred by the indifference exhibited by the junior members of the profession to the advantages to be gained by joining the society; but we trust that by persevering we shall at last include as members those whom we have hitherto failed to reach. In order to press the advantages of the society before our fellow students, we think that the question of prize competitions opened to non-members should be considered. The society consists at present of 52 members. The expenses of the half-year have been somewhat heavy, but the greater portion of the expenses were incurred in the formation, and the rate of expenditure is rapidly decreasing. A detailed account of the expenditure accompanies the report. We have pleasure in noting that the society has already assisted in promoting two good objects—viz., the new St. Saviour's Church and the Bristol Benevolent Institution, for at the bazaars in aid of these objects the society exhibited large collections of drawings. The past half-year has been the formation period of the society: the following will witness the first results of the formation, and we are sure these will be such as to give cause for congratulation to all concerned. We take this opportunity of heartily thanking those noblemen and gentlemen who have become patrons. Our thanks are also due to the committee of the School of Art for the use of the room in which we have so often met, and in which, by their kindness, our progress may still further increase; to the Press, who have so readily and kindly given publicity to our reports; and lastly, to all who have taken any part in the formation and progress of the society. May we here remind you of the connection which existed some years ago between the Fine Arts Academy and the late Bristol Society of Architects? This connection, we think, should be still kept up by at least the young architects, with the aim that the arts of architecture and painting, as practised in Bristol, and which have been to all appearances so long severed, should once more be found side by side and working in unison; and it would be a matter for general rejoicing if, at some future time, not only the sister arts, but also every allied art, such as drawing, modelling, carving, &c., may act together as one body, mindful only of the honour and well-being of the fine arts. It is, moreover, greatly to be desired that the connection already formed between the Academy and our society should increase, and that our members should look on the Academy not only as a place to meet in, but as a place to acquire learning and knowledge; for the advantages to be derived from the study which the Academy affords are not to be underrated. We also trust that our society may in time become linked to the Academy, as was the old society, and that the privileges enjoyed by the old society may now be enjoyed in some part at least by our society. This, however, is a question for further discussion. In conclusion, we hope that this society may, by attractive programmes and increased advantages, so demand the attention of the junior architects that the aim in future of every student of architecture in Bristol and neigh-

* Beckett's Provincial Builders' Price-Book and Surveyor's Guide, &c. Compiled by RICHARD BECKETT, contractor and builder. London: E. and F. N. Spon, Charing Cross.

Building Intelligence.

BIRMINGHAM.—The inscription-stone of the new Central Fire Brigade Station was laid on Friday last. The building will be faced with red brick, and ornamented with stone and terracotta dressings. To the right of the house is a wide gateway leading to the drill-ground, which is about 153ft. long and 40ft wide. Between the gateway and the house is an entrance to the superintendent's office. Beyond this is the firemen's waiting-room, and still further at the rear, running at right angles from the street, a row of houses for the firemen is being erected. The houses are planned according to the flat system. On the ground-floor there are to be three residences, each having a living-room and two bedrooms. The engine-house lies to the right of the yard, facing the houses, and will afford sufficient space for six engines. The architects are Messrs. Martin and Chamberlain, and the contractor Mr. W. T. Bennett, Mr. Clapp is clerk of works. The cost of the work is estimated at £10,000.

BIRMINGHAM.—After renovation the parish-church of All Saints', Birmingham, was reopened on Saturday. The side galleries have been judiciously removed, while the recess at the east end has been enlarged into a chancel, with a compact organ-chamber and choir-vestry on the north side. The pews have been taken away, and the church is re-seated with open pews of pitch-pine. A new pulpit has also been provided. The work has been carried out by Mr. W. Robinson, builder, of Five Ways, under the superintendence of the architect, Mr. J. A. Chatwin. The heating apparatus was provided by Mr. Henry Hope, of Lionel-street, and Mr. Roddis has supplied the pulpit and font, from the designs of the architect. The total cost of the alterations is about £1,500.

BRADFORD.—A new school which has been erected by the Bradford School-board in Wondroyd-road, West Bowling, was opened on Friday by E. L. Spencer. The school is of three departments, each consisting of a main schoolroom, four classrooms, and a teachers' with entrance-lobby also fitted up as a lavatory and cloakroom. The schools are on the wide principle, being 35ft. across. The classrooms are about 20ft. square. All the rooms are lofty and lighted by square-headed mullion-d windows; the rooms have each an open fireplace, in addition to hot-water pipes. Each classroom is divided from the main rooms by open glass screens, for the free supervision of head teachers. There are a heating chamber and storage rooms in the basement. The buildings have been erected of local stone, with ashlar dressings, dark Westmoreland slates, red deal roofs, and pitch-pine floors and fittings. The accommodation is—Boys, 312; girls, 326; and infants, 354; total, 992. The architecture is plain and substantial, with Early Perpendicular detail. The cost of the building is £9,000. Mr. E. P. Peterson, F.S.A., F.R.I.B.A., is the architect, and Messrs. John Moulson and Son the contractors. Mr. J. Johnstone has acted as clerk of works.

CREDITON.—The parish-church of Crediton, Devon, which has gradually been restored during the past few years, has just had its nave re-roofed. It has been executed from designs of Messrs. Hayward and Son, architects, of Exeter, by Mr. Wm. Dart, of Crediton. The new roof is of English oak, in the open style of the 14th century—a style that is now and again to be found in perfection in some Western churches. It is divided into thirteen bays, with curved ribs to every alternate tie-beam; panels of pierced tracery fill the space between rib and tie-beam. The sloping bays of roof are divided by moulded purlin ridge, diagonal rafters intersecting each. Carved bosses are placed at the terminals and intersections. The whole of the carving has been executed by Mr. Dart's staff. Crediton Church is well worth a visit from the archaeologist, having been the cathedral see of Devon before its removal to Exeter. There are still to be found the remains of a very beautiful sedilia and other interesting "reliquies," among which is some old armour and suits of mail, carefully preserved in the edifice. The work has been executed from designs by Messrs. Hayward and Sons, architects, of Exeter, by Mr. William Dart, of Crediton.

EAST ARDSLEY.—Last week St. Michael's Church, East Ardsley, was reopened after complete restoration. The old church having become seriously dilapidated, and repair being impracticable otherwise than at very great expense, it was decided to erect a new building. A design founded upon the old lines was prepared, and plans for building a new church were adopted, which admitted of the following arrangement. At the west, the tower is 13ft. square inside, the walls averaging 3ft. thick. The nave, the north and south aisles are 51ft. long and 41ft. wide. Projecting from the western bay of the south aisle is a large porch, which is the entrance to the church. A Norman doorway, which was originally in the south wall of the old church, has been carefully taken down, and with equal care rebuilt in as nearly as possible its original position. The chancel is 25ft. 9in. long and 17ft. wide. On the north side is placed the organ in a bay, with wide arches opening both into the chancel and the north aisle. On the south side are clergy and choir vestries, with entrances from the churchyard to both the chancel and south aisle. The style of architecture shown in portions of the old church was that of the latter part of the fifteenth century, which has been followed as closely as possible. Mr. W. S. Barber, of Halifax, has been the architect during the restoration.

HEREFORD.—A new Baptist chapel has been opened at Hereford. The structure will cost about £4,500, including site, and it has been erected from the joint design of Mr. John Johnson, of London, and Mr. George Cowley Haddon, of Hereford. The plan of the building is a parallelogram, consisting in the immediate front of a vestibule 8ft. wide, from whence the two chief entrance-doors to the ground-floor are approached, leading to the aisles right and left. The main building is 40ft. wide and 60ft. long inside, exclusive of apse for organ, and recess for end gallery. There is a minister's vestry, deacon's vestry, &c., and a spacious heating-apparatus chamber, with accessories in the basement, which is fitted with Grundy's patent hot-air apparatus. There is accommodation on the ground-floor for 400, and on the gallery-floor for an additional 250 persons, making a total of 650 sittings, allowing 20in. for each, but when put to the full test the building will accommodate a greater number. The facade is executed in special-made white bricks, with Beer (Devonshire) free-stone dressings. The amount of the contract was £2,665, and the work has been carried out by Mr. William Bowers. The flooring of the chapel is laid with Godwin's encaustic tiles.

LOSTWITHIEL.—The private chapel of the Lostwithiel House of Mercy, erected some time ago from the designs of Mr. George Edmund Street, R.A., has just had an addition made to it in the shape of a reredos of alabaster and Devonshire and Cornish marbles. The reredos has been designed by Mr. R. Medley Fulford, F.R.I.B.A., architect, of Exeter. The sill of the eastern window being high up, plenty of wall-space has offered good scope for design, and hence the reredos has been carried to a considerable altitude. There is a broad retablo of white marble, upon which the main structure rests. This consists of a triple arrangement, separated by massive buttresses and terminating with gables. The central one of the three is the largest and most dignified. The arches within the gables are cusped, and the gable copings are deeply moulded and enriched by crockets, terminating with carved pinnacles. The buttresses are panelled, and finished with sealed terminations which carry shafts of serpentine marble. The central gable has a similarly arranged finial, and upon these five elevated bases, it is intended, when funds permit, to place as many sculptured figures. The greater part of the reredos is of polished English alabaster; but warm red stone, from the quarries of Dumfriesshire, is also introduced with excellent effect. The shafts at each side of the recessed panels are of polished Cornish serpentine marble. These panels themselves contain some tile paintings. The reredos has been made and placed *in situ* by Mr. Harry Hems, of Exeter.

MANCHESTER.—The memorial-stones of two schools now being erected by the Manchester School-board were laid last week. The first ceremony took place in Smedley-road, Cheetham, where a school is being built to accommodate 900 children. The buildings are to be in a simple

Gothic style. The works are being carried out by Mr. J. L. Ward, of Manchester (the contract price being £7,000), from the designs of Messrs. Potts, Pickup, and Dixon, architects, Manchester and Oldham. Another ceremony of a similar kind took place shortly afterwards at Ross Place, near Hyde-road, Ardwick. The building will provide accommodation for 1,000 children. The schools are to be in the Gothic style of architecture. The fronts will be faced with selected grey common brick, which will be relieved by masses of red stock brick and stone dressings. The work is being carried out from the designs of Mr. Henry Lord, architect, by Messrs. Robert Neill & Co., for the contract sum of £7,384.

MIDDLESBROUGH.—A new Wesleyan chapel and school rooms were opened at South Bank, Middlesbrough, on Tuesday. The buildings are constructed of local bricks and roofed with Welsh slates. The chapel measures 79ft. by 44ft., and is 28ft. high from floor to ceiling. It is provided with a gallery on three sides, and with a pulpit platform, and all the internal woodwork is of pitch-pine. Accommodation is provided for 720 worshippers. The main school is 54ft. by 33ft., affording room for 247 scholars; the infant-school is 27ft. by 19ft., and is provided with kitchen and cooking-range; the four vestries average 16ft. by 14ft. each. Mr. F. R. N. Haswell, F.R.I.B.A., of North Shields, is the architect; the contract was let to the late Mr. John Clark, of South Bank and Saltburn-by-the-Sea, and Mr. John Sturdy, of Middlesbrough, has acted as clerk of works.

NORTHAW.—On Monday week the foundation, or memorial, stone of a new church for the parish of Northaw was laid. The original church was probably built by Llanfranc, Archbishop of Canterbury, in 1070, and was a chapel of ease belonging to St. Peter's, St. Alban's. The new church was commenced some seven weeks ago by Mr. John Bentley, of Waltham Abbey (who also built the new church at Enfield), from the plans of Messrs. Charles Kirk and Sons, Sleaford. The edifice, erected of Ancaster stone, will consist of nave, chancel, north and south transepts, south aisle, and porch with open tower at western corner of the south aisle. The tower will form the baptistery, and the upper part will be finished with four pinnacles. Mr. Bentley's contract for the building is £1,630, but the total cost of the church when completed and fitted for service is estimated at £7,000.

PENZANCE.—The new church of St. John the Baptist, in Trewartha-terrace, Penzance, was consecrated on Tuesday by the Bishop of Truro. It consists of a chancel 34ft. long by 10ft. wide in north and south aisles each 13ft. wide, and transepts each 22ft. by 20ft.; and a nave 73ft. by 23ft., with aisles each 54ft. by 11ft. and north porch. A tower 20ft. square and 66ft. high will hereafter be built on the south side. The style is Early English, the windows being double lancets in the aisle walls and triple lancets at the east and west ends of church. The walls are faced with Cheltenham Down stone, with Hamble dressings, from the quarries of Mr. Charles Trask. The internal stonework is of Douling stone, also supplied by Mr. Trask, and the internal woodwork is of varnished pitch-pine. The transepts and crossing are seated with benches, and the remainder of the church with chairs, the total accommodation being for 600 persons. The roofs are open and plastered, and are covered with Delabole slates. The sacarium is laid with encaustic tiles by Messrs. Goodwin, of Hereford, and the remainder of the floors with plain tiles by the Architectural Pottery Company, Poole. Beneath the chancel are two vestries, one 31ft. by 20ft. for the choir, the other 18ft. 6in. by 13ft. for the clergy; these are connected with the church by a flight of 19 granite steps, and have roofs of brick arching supported by wrought-iron girders and cast-iron pillars. Mr. J. Piers St. Aubyn, of the Temple, London, is the architect; Messrs. Carah and Edmunds, of Crowan, are the contractors. Mr. Hofman, Penzance foundry, supplied the ironwork, and Messrs. Willey and Co., Exeter, the gas-fittings. The cost has been about £7,000. Mr. John Trousoun, of Penzance, superintended the work.

POLEGATE.—The London, Brighton, and South Coast Railway have built a new station at Polegate. The new buildings, although not so handsome as those just finished at Hassocks-gate, are equal in accommodation, arrangement, and comfort to

any station on the system. The works were commenced in July last year. The buildings are Italian in style, and faced with Portland cement. The station is approached from the Pevensey-road, and has three entrances, one right and left of building, and following between back, front, and a massive retaining wall, the centre one, which communicates directly with the booking-office, through which we reach the subway and meet the other two passages, being under a carriage porch constructed with ornamental iron columns, brackets, girders, and covered with a wood and glass roof. On the ground-floor there is a cloak-room 15ft. square, a ticket and telegraph office of the same size, booking-office 10ft. by 10ft., waiting-room 10ft. by 12ft., ladies' room, lavatory, &c., &c. The station-master's residence, which is above, consists of sitting-rooms 15ft. by 12ft., three bedrooms, and a kitchen, each about 12ft. square. The subway is 10ft. long, 9ft. wide, and 8ft. 3in. high, lighted with Hayward's patent lights, and leads from booking-office to the entrance on south side of the station. The platforms are each nearly 65ft. long by 7ft. wide, and have light roofs, part glass and part zinc, supported by iron columns, which are bolted down to concrete piers about 2ft. deep by 2ft. 6in. square. The arrangements comprise ladies' room 15ft. by 11ft., general waiting-room 10ft. by 12ft., refreshment-rooms 24ft. by 11ft., fitted with marble counter tops on panelled framing, which is grained Italian walnut and oak to match the doors, and the mouldings are finished black. The kitchens are 11ft. by 10ft., station-master's office 13ft. 6in. by 11ft., ticket collector's office 15ft. by 11ft., porters' room 12ft. by 11ft., lamp-room 11ft. by 8ft., coal-closets, &c., &c. The platforms are lighted by spherical gas lamps. The new portions of the line and the station was designed by Mr. E. D. Bannister, C.E., engineer in chief to the Brighton Company. The works were carried out under the superintendence of Mr. H. J. Munnering, assistant engineer. Contractor, Mr. J. Anson, Queen's-road, Brighton, foreman of works, Mr. F. Chettleburg, Company's resident inspector, Mr. F. Hards.

REVELSTOCK.—A new church at Revelstoke is nearly completed. The church has been designed by Mr. James Piers St. Aubyn, F.R.I.B.A., and is in the Perpendicular style. There is a fine western tower, which will be embattled, and carried up at its north-west angle by a still higher turret, the tower is strongly buttressed. The building on plan presents a nave, north and south aisle, and chancel. It is to be built of local stone, raised in the immediate neighbourhood, while all the dressings and worked masonry inside and out are of Dartmoor grey granite. The roofs will partake of the local West-country character known as barrel or wagon-roofs. They are being framed of British oak, and the various intersections of rib and purlins will all be covered by carved bosses in the same material. The pulpit will also be of carved oak, upon a granite base; ornamental parclose screens will separate the chancel from its aisles, these, like the stalls, and the seating throughout the body of the building, will also be of oak. Mr. Piers has been entrusted with the making of the pulpit, stalls, screens, and oak fittings generally. The structure is being erected entirely by workmen on the estate, overlooked by Mr. G. W. Crosbie, the estate clerk of works.

WAKEFIELD.—A new bank at Wakefield was opened on Monday. The style of architecture adopted is in a word "Queen Anne," carried out in perfect small-scale red bricks, with limestone dressings. The words "West Riding Bank" are cut over the entrance in the stone frieze. The works have been completed by Messrs. J. and W. Bland, of Bradford, and Mr. Tattersall, plasterer, of Wakefield. Mr. Appleyard, of Leeds, had the carving in brick, stone, and wood, and with Messrs. Thompson and Dalton, of Leeds, executed the stained and encaustic glasswork, and Messrs. Clark, Bannett, and Co. the steel shutters, the whole having been arranged from the drawings, and under the personal supervision of Messrs. J. Nott and Son, architects, of Leeds.

A magnificent altar erected in St. Mary's churchyard, St. Andrew's, Mr. J. Douglass Matthews is the architect.

COMPETITIONS.

FULHAM WORKHOUSE INFIRMARY.—The Fulham board of guardians received at their meeting on Thursday in last week, a letter from Mr. G. E. Street, R.A., as President of the Royal Institute of British Architects, recommending Messrs. L. H. Currey, of 37, Norfolk-street, Strand; P. C. Hardwick, Hereford-gardens; and E. P. Anson, F.G.S., of Lower Poulteney-hill, E.C., as suitable gentlemen to act as consulting architects in the infirmary competition. One of the members suggested that all three should be retained, but the clerk having mentioned that Mr. Currey was the architect of St. Thomas's Hospital, that gentleman was appointed.

WINCHCOMBE BOARD-SCHOOLS.—The Winchcombe School-board opened last week tenders for the proposed boys' school, in accordance with plans prepared by Messrs. Medland, whose designs were selected in the recent competition. These proved so much higher than was expected that the Board decided not to allow the amounts to be made public, and after the interchange of some personalities, ordered the following resolution to be entered on the minutes: "The Board, considering that all the tenders received are so largely in excess of the estimate given by the architects as to show that a most serious error must have been made by them in their calculations, and that it was mainly upon such estimates that their tender [sic, design] was accepted, direct the clerk to express to them their dissatisfaction, and to ask whether they will be prepared to get the work done for the amount at which they estimated it, or within a reasonable excess of such amount, and if not the Board are of opinion that Messrs. Medland should withdraw their plans, and all claims in respect thereof, on being allowed a reasonable sum for their troubles may be agreed upon." A member remarked that he could not understand why the school should cost them £14 a-head, when others in the neighbourhood had been erected for £1 10s. a-head. A letter was read from Messrs. Chatters and Chandon, unsuccessful competitors in the recent competition, offering, in the event of the Board declining to go on with Messrs. Medland's plan, to guarantee the erection of a school from the design they submitted for within £50 of the estimated cost, £1,070.

ARCHITECTURAL & ARCHÆOLOGICAL SOCIETIES.

PENZANCE NATURAL HISTORY AND ANTIQUARIAN SOCIETY.—The annual excursion of this society took place on Friday last, when a large party accompanied their president, Mr. C. C. Ross, M.P. Penzance Castle was the first place visited, and was described by Mr. T. Cornish, who said that though it was traditionally said to have been built in Henry VIII.'s time, the remains showed that it was built during the reign of Elizabeth. The existing tower could never have been a defence against guns, but it was to be feared that it played a part in the wrecking which took place opposite, for it faced the most dangerous part of the Mount's Bay coast. The Rev. W. S. Luch-Szymra read a paper on "The Legendary History of the Castle," which he said belonged to the Faust family of Renaissance myths. Mr. Borlase, M.P., said towers of this character were very common adjuncts to Cornish houses, as at Cotehele and Treuniger, but in no case did they appear to be intended for defence, or to serve any other purpose than an architectural feature of the residence. At Breage the chief features in the church were shown by the vicar, the Rev. E. M. Pridmore, and some notes were read by Mr. Whitely. Godolphin House was afterwards seen. Mr. Rosenreim and Mr. Borlase, M.P., acting as guides. St. Hilary Church and the two carved stones in the churchyard were described on the homeward journey by the Revs. S. Kingsford and W. S. Luch-Szymra, and in the evening a conversazione was held at Morrab House.

ARCHÆOLOGICAL.

BALFOUR.—In the course of excavations made by Mr. George Wells under his premises on the south side of Castle-lane, which occupy the site of Balfour Castle, a number of Roman and Saxon remains have been found. They include

pottery of both the periods named; Roman bricks, fragments of flues and tessellated work, and encaustic tiles, and a few pieces of masonry, having on them Norman, or perhaps Saxon, mouldings. The discoveries, which are important, as showing that Bedford was indubitably a Roman station, are to be followed up by further investigations on the opposite side of the lane.

CHIPS.

A stained-glass window, designed by Mr. Burne Jones, has been placed in St. Peter's Church, Vere-street, Oxford-street, W.

The new Glynn memorial pulpit in the nave of Tewkesbury Abbey was used for the first time on Sunday week. It has been erected from the designs of Mr. J. Oldrid Scott, and is octagonal in shape, Early Perpendicular in style, and constructed of Purbeck marble and stone.

The annual dinner of the Builders' Benevolent Institution will be held on the 3rd November, at the Freemasons' Tavern, Mr. George Burt, J.P., in the chair.

Mr. William Lee, J.P., who for fifteen years represented Maidstone in Parliament in the Liberal interest, died last week at his residence at Holborough Court, Snodland, Kent. Mr. Lee, who was senior partner in the firm of Lee, Son, and Co., cement manufacturers, Snodland, was born at Lewisham, 1801, and married nineteen years later. He unsuccessfully contested Maidstone in 1852, but was successful next year. He was defeated in 1857, regained the seat in 1859, and held it until he retired in 1870. He was a magistrate and deputy-lieutenant for Kent.

A further advance is notified in window-glass. On July 23 last, window-glass advanced 7½ per cent., on August 25 10 per cent., and again on the 25th inst., 7½ per cent., making 25 per cent. advance in the aggregate.

The memorial-stone has been laid of St. Matthew's mission church, at Fenton, in the Potteries. The church will seat 500 persons, and will cost about £2,500. Messrs. Inskip are the architects.

New gasworks at Smethwick, Birmingham, were formally opened on Saturday. They have been erected at a cost of between £50,000 and £60,000, from the plans of Sir Frederick J. Bramwell.

Plans prepared by the Rev. — Loftie, of the Chapel Royal, Savoy, are about to be adopted for the restoration and reseating of Smeeth Church, Kent, having been submitted to, and approved by, Messrs. Micklethwaite and Middleton, architects, of Westminster.

A new estate to be known as Naza Park is being laid out for building purposes at Walton-on-the-Naze, and the foundations of the first villas are being laid. Mr. Eide is the contractor.

The Lewisham district board of works last week elected Mr. Ernest Van Putten as assistant surveyor.

A deputation from the Worcester town council visited last week the sewage works and farms at Droitwich and Kidderminster in order to inspect the modes of working.

A Methodist Free church at Luddenden Foot was reopened on Saturday after repewing in pitch-pine, and other internal structural alterations. Messrs. J. Dyson and Sons, of King's-cross, Halifax, were the contractors.

The corporation of Wakefield are at present engaged in the construction of new waterworks, by which an abundant and pure supply will be furnished to the town and neighbourhood from the Rishworth Moors, instead of that which has hitherto been used from the polluted river Calder. The works are being carried out under the superintendence of Mr. E. Filler, C.E., of Leeds, and are to be inaugurated on the 18th November by the public turning of the first sod for the principal reservoir.

The new church of St. Mark, Farnborough, was consecrated by the Bishop of Winchester on Tuesday week.

Mr. J. F. Bateman, C.E., visited Cheltenham last week, preparatory to reporting to the town council on the best means of increasing the supply of water.

The Midland sawmills, Lower Bristol-road, Bath, the property of Mr. F. W. Lee, timber-merchant and packing-case manufacturer, were destroyed by fire on Wednesday week.

New Baptist Sunday-schoolrooms were opened at Stantonbury, Bucks, on Tuesday week. The builder was Mr. Mitchell, of Newport Pagnell.

A nave and aisles have been added to St. Mary's Church, Tyndall-park, Bristol, and will be opened by the bishop of the diocese on Thursday next.

"To a practical man with a taste for mechanics, and the bumps of constructiveness fairly well developed, we can conceive no higher mental treat than a couple of hours spent over the June numbers of that truly marvellous publication the *English Mechanic*. In a hundred and fifty odd pages that make up the bulky mass of letterpress, there is recondite information on almost every conceivable subject, ranging from how to construct a mouse-trap, to the latest method of calculating the phases of Orion."—*The Brightonian*. Price Twopence of all newsmen, or post free 24d.—31, Tavistock-street, Covent garden, W.C.

TO CORRESPONDENTS.

[We do not hold ourselves responsible for the opinions of our correspondents. The Editor respectfully requests that all communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondence.]

All letters should be addressed to the EDITOR, 31 TAVISTOCK-STREET, COVENT-GARDEN, W.C.

Cheques and Post-office Orders to be made payable to J. PASSMORE EDWARDS.

ADVERTISEMENT CHARGES.

The charge for advertisements is 6d. per line of eight words (the first line counting as two). No advertisement inserted for less than half-a-crown. Special terms for series of more than six insertions can be ascertained on application to the Publisher.

Front Page Advertisements 2s. per line, and Paragraph Advertisements 1s. per line. No front page or paragraph advertisement inserted for less than 5s.

SITUATIONS.

The charge for advertisements for "Situations Wanted" is ONE SHILLING for TWENTY WORDS, and Sixpence for every eight words after. All *Situation* advertisements must be prepaid.

Advertisements for the current week must reach the office not later than 5 p.m. on Thursday. Front page advertisements and alterations in serial advertisements must reach the office by Tuesday to secure insertion.

TERMS OF SUBSCRIPTIONS.

(Payable in Advance.)

Including two half-yearly double numbers, One Pound per annum (post free) to any part of the United Kingdom; for the United States, £1 6s. 6d. (or 6dols. 40c. gold). To France or Belgium, £1 6s. 6d. (or 33s. 30c.). To India (via Brindisi), £1 10s. 10d. To any of the Australian Colonies or New Zealand, to the Cape, the West Indies, Canada, Nova Scotia, or Natal, £1 6s. 6d.

Cases for binding the half-yearly volumes, 2s. each.

NOTICE.

Now Ready.

Vol. XL., Price 12s. A few bound volumes of Vol. XXXIX. may still be had, price Twelve Shillings; all the other volumes are out of print. Most of the back numbers of former volumes are, however, to be had. Subscribers requiring any back numbers to complete vol. just ended should order at once, as many of them soon run out of print.

RECEIVED.—G. S.—H. and G.—W. C.—G. A. W.—D. F. Co.—G. N.—J. M.—S. Bros.—J. and S.—B. and P. H. B.—C. and Co.—E. B. and Co.—D. F.—F. I. Co.—J. W.—M. and Co.—C. S.—F. W. and Co.—B. and O.—H. P.—W. B.—B. of R.

Correspondence.

EASTGATE HOUSE, ROCHESTER.

To the Editor of the BUILDING NEWS.

SIR,—A very sparkling and highly imaginative sketch of Eastgate House appears in your paper of yesterday. Unfortunately the house is totally unlike the sketch whether the proportions or materials are considered. Eastgate House is a large and rather grand-looking building. It looks a worthy residence for a Secretary to the Admiralty, whereas your illustration conveys the impression of a small picturesque house. I send you herewith a photolithograph from a drawing made some years since, which shows the house in its true proportions. There is, I think, only one mistake in it, and that is, the drop in the centre where the two gables meet is omitted. If you like to publish it I shall be pleased to send the drawing from which the photolithograph was made with the mistake corrected.

To show how wrong the illustration you have published is, I would point out that fifteen courses only are shown in the chimney to the right; there really are twenty-four courses. This vice goes through the whole drawing. Highly ornamental brackets are shown to the lower story—there are none; the stringcourses wave as shown in the photolithograph sent—in your illustration they are crisply drawn with a straight edge. A sort of plaster runs up the nearest corner all formed in cement—this, and a peculiar ornament on the first floor, are entirely omitted. The oriel window on the first floor is

shown much too wide. I will say no more.—I am, &c., JOHN DRAKE.

High-street, Rochester, Oct. 1st.

[The difference between the two sketches is certainly considerable; we regret want of space prevents us from reproducing Mr. Drake's drawing.—Ed. "B.N."]

FIRES IN THE CITY.

SIR,—One is glad to see the City authorities are taking into their consideration the immense value of goods stored in the several warehouses in the City, and are bestirring themselves to make large additions to the Fire Brigade.

It would be an advantage if, in addition to providing more fire-engines, some measure of precaution were taken where warehouses are let in separate stories, for preventing fire being communicated from one floor to another, and that there should be safe modes of ingress and egress.

In the case of the recent fire at No. 45, Cheap-side, it is evident that the staircase (apparently a wooden one) was the channel by which the fire was communicated from first to second floor.

Much has been written at various times about staircases acting as flues, and conducting fire from floor to floor with exceeding rapidity, thus cutting off exit from the upper portions of a building.

Where the floors of warehouses are let to different tenants, the stairs ought to be isolated. Architects might easily arrange this, and make them a beautiful feature of the building.

The steps ought to be out of firestone, not, as is the modern practice, out of soft limestone, which, in case of fire, speedily calcines, and when the fireman's hose is turned thereon, falls like quicklime. Hence the just condemnation of Captain Shaw of stairs built of such stone; whereas, if steps were of firestone (much of which is very beautiful), it would afford safe ingress and egress.

The staircases should be entirely of firestone, the skirtings of hard cement, and if any ornamentation is required, have a dado of ornamental tiles.

The doors, light iron ones (readily painted to imitate wood) for use during the day, closing with a heavier door on the fireproof principle at night.

If the colour of the stone is the object, stones from Craigleith, Thornthwaite Brough, Hart-with Stott, and many others, are the same in appearance as the soft white limestone so much used.

There are also numerous other stones equally good as fire-stones, which would come in at less price, and afford equal safety to those stones above referred to, viz.: Scotgate Ash, Wild Carr, Cunliffe, Greenmoor, Fell Beck, &c.—I am, &c., SAMUEL TRICKETT.

HOUSE-TOP GARDENS.

SIR,—If the writer of the letter in your last week's paper will call here, he will see the very thing he describes forming the roof of my offices. It has proved a great success, and was engraved in the *Garden* and in the *Illustrated American* ten or eleven years since. Any passer-by can see it, although, as Bunhill-row is not a leading thoroughfare, it is not so well-known as it would otherwise be.—I am, &c., 121, Bunhill-row, E.C. W. H. LASCELLES.

MUSEUM COMPETITION, DUBLIN.

SIR,—I sent a note a few days ago, asking for an extension of time in connection with this competition, and in reply the secretary wrote: "It is not considered necessary to extend the time, as the number of applications for the conditions for the competition has been very large, and there have been but two applications for the extension of time." I have now to suggest that those among the intending competitors who find the time too short, should at once write, asking an extension of at least a month. It is quite evident that no architect whose time is otherwise much occupied can do anything like justice to this competition within the time allowed at present. In the Glasgow Municipal Buildings competition more than three times as long was given, and I have not yet heard anyone complain of its being too much.—I am, &c., 4th Oct. AN ARCHITECT.

"WAYSIDE NOTES IN THE WEST."

SIR,—In reply to "Provincial" I beg to say that I am an architect. What, I beg to know, does "Provincial" understand by *esprit de corps*? Union for noble ends, or swearing black's white, so hang together lest we hang separately? Art (like religion) stands high above its professors. If I am obliged to choose sides, I prefer to range myself with art. "Viator" makes, I think, a poor apology for Sir Gilbert Scott. I spoke of organ screens, he mentions several as exceptional cases which are not of the class referred to. Amongst others concerning which Scott was guilty, must be named Bristol. I deplore the injury at St. Paul's, Westminster, and Chichester. "Viator" can best answer the query of "East Anglian."—I am, &c., M.

HOUSE-DRAINAGE AND SEWER AND GULLY VENTILATION.

SIR,—Your correspondent "S. T. G." (p. 443) invites opinion upon the subject of trapping and ventilating street-sewers. This is no doubt a matter of great importance, and as yet not generally adopted in practice. Its necessity is nevertheless admitted, and when existing prejudices are set aside and the question better understood, all our main sewers will be as far as possible properly ventilated.

House-drainage and street-sewers, although distinct questions, cannot well be separated. In reference to the former a greatly improved system prevails to that formerly practised. We have now glazed fireclay tubes of sizes for all requirements, with socket joints and bends and junctions to suit all curves, and by the adoption of trapping inside and disconnection outside the house, the waste-pipe delivering over a gully and grate, or placing the gully lower down and fixing a grating over the same with the waste-pipe under the grate, which is equally effective (and which method is by no means a new one, as your correspondent "S. T. G." appears to think—I have adopted it myself, and know others to have done so years since). With these provisions properly attended to, house-drainage is practically safe.

Before we can carry out any well considered system of drain and sewer ventilation we must first insist that their construction shall be perfect and complete. The materials must be of the proper description, and the workmanship well and carefully done; falls must be as much as practicable and uniform throughout. (It is not uncommon in opening out a drain to find the pipe one-third full of sediment by being laid too low at a particular place.)

Were these conditions carefully attended to, there would not be that amount of stagnant matter lying in various places to generate gas, as they would run themselves comparatively clean, and free ventilation could then be more safely attempted. I use the term free ventilation, as I think it is in this direction we must look for solving the question. Mechanical contrivances have been proposed, and various methods for extracting the foul air or gases, but they are very uncertain in their action, and but very unsatisfactory.

Your correspondent suggests the introduction of a trap or siphon at the end of each street. I think the plan would be very objectionable, and would prevent the free discharge of the sewage. The multiplication of traps I consider an evil. They are essential at proper places. Untrapped street-gullies have been referred to; but I believe in some places the gullies are purposely left untrapped to ventilate the sewers.

Speaking from experience, I don't think the street gully-grates close by the footways are the most desirable places to ventilate the sewers. But it is a well-known fact that where gullies are trapped, when most needed, in dry weather, the water has all evaporated, and the trap is a delusion. The proper place to ventilate the sewers appears to be the centre of the roadway, over the sewer, at regular distances, and having good strong large iron grates at the road-level, with proper provision to catch the detritus or road-grit, and having regular attention to keep same clean and open. If objection is taken to offensive smells along the centre of the roadway, I would say it must be far better to let it out freely there, than being confined, forced to make its escape at places likely to be injurious to health. Inlets might be made in some instances at convenient places for the admission of fresh air into the sewers at the low-level.

Some of the ventilating shafts over the sewers might be made sufficiently large and used to receive the inlet-pipes from the street gullies, which pipes would only require to be comparatively small in diameter, and these pipes could also be used for rain-water pipe connections from the front of the houses. The gullies could be left untrapped, as these drains would enter the sewer by a shaft properly ventilated, and the sewage drains would be the only ones having a direct communication with the street sewer.—I am, &c.,

York, Oct. 4.

W. B.

OIL-PAINTING.

SIR,—The invention of oil or varnish-painting is one of the many instances where the original inventors have been forgotten while the improvers of the invention have got all the credit for it. Hubert Van Eyck and his brother John are the reputed inventors of oil-painting. The former was born in 1366, and the latter about 1390. I find the following interesting allusion to the art in "Memorial of London" (extracts from the early archives of the City of London, selected, translated, and edited by H. T. Riley).

ACKNOWLEDGMENT MADE BY A PAINTER, 12 EDWARD I., 1284
"On Friday, the Eve of St. Botolph (17 June), in the 12th year of the reign of King Edward, Nicolas Bacon, painter, acknowledged that he was bound to Hugh Motun, in the sum of twenty shilling, for cinople, * vermilion, and canvas, varnish and verdigris; the same to be paid to the same Hugh, or his certain attorney, ten shillings at the Feast of St. Bartholomew (24 August) and ten shillings at the Feast of St. Michael (29 September) without further delay."

A passage in *Liber Horn*, fol. 341, temp. Edward II (preserved at Guildhall) throws some light on this early allusion to oil-painting.

"RULES AS TO PAINTING OLD AND NEW SADDLES.

"It is provided that no one put any but good and pure colours upon gold or silver; that is to say, good cynople, good green, good vermilion, or other colours tempered with oil, and not brass, a coarse red, or indigo of Balidas [Bagdad], or any other bad colour."

—I am, &c.,

C. F. M.

LEAMINGTON SPA COMPETITION.

SIR,—In reply to "Observer" in your issue of 16th ult., I may say that 46 designs were sent in, from which the council selected three, and ultimately decided on that of Mr. J. A. Cundall, of Leamington.

Local opinion, however, has been divided on the question of the necessity of the building, and it has not been decided whether the design shall be carried out, or whether the Denbigh Villa be converted into municipal and public buildings.

I think the council ought to have decided this point before they put competitors to the trouble of sending in designs.—I am, &c.,

Oct. 5th.

YOUNG COMPETITOR.

CHIPS.

The foundation-stone of a new water-works engine-house was laid on Monday, at Eastbourne, by Miss Ada Currer, of London, the daughter of the architect to the Duke of Devonshire's estate.

Colonel Yolland, chief inspector of railways, has been gazetted to a civil companionship of the Bath.

A subscription portrait of Mr. T. R. Hall, M.P., has been painted by Mr. Frank Holl, A.R.A., and hung in the Guildhall, Worcester. The unveiling took place last week.

New schoolrooms attached to the Presbyterian Church, St. Matthew's, Ipswich, were opened on Wednesday week. They are faced with Kentish ragstone, with freestone dressings, and are furnished in pitch-pine; the chief room seats 200 children, and the cost has been £550. Mr. Frederick Barnes, F.R.I.B.A., of Hatton-court, Ipswich, who designed the adjoining church, was the architect, and the contract was taken by Mr. C. Borrett.

Shoreditch Town-hall has been for many weeks undergoing extensive renovation. The general colouring and decoration of the large public-hall and of the offices are very successful, while the council-chamber, the meeting-room of the vestry, in which the decoration has been far more extensive, has a very handsome appearance. Messrs. Lily and Wood have carried out the more important part of the decoration, and Mr. R. Conler has had the general contract. The whole of the work has been carried out under the direction and superintendence of the architect, Mr. Richard J. Lovell, A.R.I.B.A., 63, Finsbury-pavement, E.C.

* "Cynople," a green colour mentioned in old French heraldry is no doubt the one here meant."

Entercommunication.

QUESTIONS.

[6682.]—**Statics and Dynamics.**—Will any of your readers kindly recommend a good book on above for a beginner, and also one a little more advanced?—W. S.

[6684.]—**House Surveying.**—A large builder told me recently that a surveyor came to examine a mansion with a spirit level and plumb-line, and I heard of another surveyor using a gimeter at the end of a walking-stick to try the soundness of rafters. Pray, are such tests usual, and is there any cheap book giving practical hints on house surveying?—N. W.

[6684.]—**Burnt Ballast.**—Will some experienced reader kindly give me a few hints as to burning clay into ballast, making fire at first, and proceeding operations, how much firing to use, &c., and greatly oblige—SUNSHINE.

[6685.]—**Plastering.**—What is the cause of cracks showing in ceilings, &c., often in good work where no shrinkage of timber, &c., occurs? Is it too great a body of rendering on, or the setting followed on too sharp, or again left too long before the next coat is put on; and as to laths, are the rent equal to the straight cut laths? It seems to me the rent laths being all sorts of curves and full of large knot holes, the prickling up coat varies much in substance, and is not this a cause of cracks, through unequal drying and shrinkage?—ESQUIRE.

[6686.]—**Cement Work.**—A flank wall has been rendered finished, trowelled face. The face is peeling off about 1/4 in. thick. What is the cause of this? Is it the different gaugings from rendering and finishing coat? The rendering is perfectly sound and dry. Will back ing over the whole face stop it from peeling again when done again?—YOUNG BEGINNER.

[6687.]—**Zinc Soakers.**—Will some reader kindly give sketch or say how these are made and put under the slates, and whether any flashing is required, and if cement fillet is put over?—ESQUIRE.

[6688.]—**Factor of Safety.**—Will any of your readers kindly explain the meaning of "factor of safety," and how it is used?—M.

[6689.]—**Local Taxation and Tithes.**—What book or books can be recommended for reading up the assessment and incidence of Government and local taxation and tithes?—JNO. TREVOR.

[6690.]—**Oil in Boards.**—I have a quantity of flooring laid which is to be stained and varnished. Through carelessness a man has spilt several quantities of sweet oil over boards. What is the best remedy for taking out the stains so that it will not affect or show when the above work is executed?—LEO.

[6701.]—**Books.**—Can any one oblige me with publishers' names, prices, &c., of really good practical inexpensive recent works published on the following subjects:—1. Planning, arrangement, &c., of small farm buildings. 2. Handbook on specifications of the several trades, as required in the practice of an architect. 3. Good London and provincial price book for this year. 4. Practical work on measuring, surveying, and levelling ground.—SUBSCRIBER.

[6702.]—**Lunatic Asylums.**—What is the best published work on these? Name of author and publisher would oblige.—ESQUIRE.

[6703.]—**Boundary.**—An adjoining owner has a building which stands back from my boundary 4 in., but his eaves hang over 12 in., and so are within 10 in. of my boundary. How far must I keep back from my boundary with a new building, which will be above my neighbour's eaves?—ACCURACY.

[6704.]—**Riding Schools.**—Are there any riding-schools in London situated upstairs, and on what floor? Of what are the floors constructed? Would brick arches covered with concrete say 6 in. supported by ironwork do? What proportion should the length be to the width for a four sized school?—G.

[6705.]—**Brick Architecture.**—Will any reader kindly give the name of any good books illustrated which treat of brickwork and its applications to domestic and ecclesiastical architecture? What parts of England have the best examples of brick architecture, and will any one name a few within 100 miles of London? I particularly want to see some good but plain work, where stone is either unused or but sparingly introduced.—S. F. C.

[6706.]—**Sningles.**—Will any reader say what is the usual size and thickness of the above, how they are worked at the hips, and the manner in which they should be described in specification.—A 10 YEARS' SUBSCRIBER.

REPLIES.

[6654.]—**Ventilation of Soil-pipe.**—In reply to W. P. Buchanan, I have not used his I.C. cowl, and certainly do not consider a good cowl, "that is, one that requires no attention," useless. They are absolutely necessary in close and confined places. I should have been more specific in my reply, as I was thinking of the revolving cowl, and anything in that form requiring constant attention, which they are sure not to get, is objectionable, and without that attention they become useless. For the case in point, I have no doubt a full-sized ventilating shaft and fresh-air inlet properly put in, would have counteracted the evil.—WILLIAM H. BUCHANAN.

[6659.]—**Ventilation of Soil-pipe.**—In my answer to this on p. 469, the word "remove" on the eighth line should be "replace."—HUGH McLACHLAN.

[6697.]—**Religious Houses of the Middle Ages.**—Sharpe's "Architecture of the Cistercians," Viollet le Duc's "Dictionnaire Raisonné de l'Architecture." The late Canon Mackenzie Wallace proposed to bring out a work on mediæval religious architecture, but I am not aware if it was ever published. The works of M. Lacroix would probably best give the information

required by your correspondent; "The Monarchs, Customs, and Dress during the Middle Ages," and "Military and Religious Life in the Middle Ages," both profusely illustrated: the originals are in French. The architecture and dress in the best works have been kept distinct. I believe the best work on costumes is the one by the late Mr. Planché.—HUGH McLACHLAN.

[6698.]—**Involution.**—By logarithms. The logarithm of the number to be raised is first looked out from a table, the log. is then multiplied by the number 3, 5 or whatever power it is required to raise the number to, the product will give a new log., which is that of the result required. It is best first to obtain a little knowledge on logarithms before using them, they are easy to learn, though to understand the theory requires an acquaintance with the "binomial theorem."—HUGH McLACHLAN.

[6699.]—**Lighting Cellar.**—"J. H. A." does not explain whether he wants cellar under floor of shop or under pavement lighted, and I expect one of the two, if not both, is intended. Use Hyatt's or Hayward's lens lights, the makers will tell you which description is best. I can see no other reason for supposing wood to be better than iron for the framework than that cast-iron becomes very brittle under severe frost and has been known to break when stepped on. Wrought iron might be used. Iron has the advantages of greater strength, smaller section of framework, thereby offering less obstruction to light, and much greater durability under the wear of feet. Glass can be fastened to it as easily as to wood, and even rust will not destroy it as soon as wear or rot will wood, if both are equally cared for or neglected. Experience is also in favour of iron, wood framework for glass paving being nearly discarded.—HUGH McLACHLAN.

[6670.]—**Enamelled Iron Tiles.**—The refreshment room of the Shorncliffe railway-station has the walls covered with enamelled iron tiles. They have been fixed about a year, and show no signs of warping or bulging. The surface yields to pressure, but no injury is apparent. A good backing of cement ought to obviate this yielding. I should be glad to learn the name and address of the makers.—JNO. TREVOR.

[6670.]—**Enamelled Iron Tiles.**—Where earthenware or china tiles can be used, as on floors, walls, and ceilings of concrete floors in all of which they can be easily fixed in cement, or in jambs and lintels of stoves when the framing is made to receive them, I would prefer them to the enamelled iron for artistic appearance and durability. On many ceilings and other places enamelled iron is the best, since it can more easily be fastened to wood-work with greater security. I do not think tiles secured by pins at the angles can make durable work, however well they may look when newly fixed. Great heat from fires or the sun would warp the iron, on account of its little thickness, otherwise I see no reason for such a result. Enamelled iron is easily cleaned and looks fresh after the process, the enamel will, however, wear off as with tiles.—HUGH McLACHLAN.

[6671.]—**Rights of Light.**—Mr. Bell answered this very fully last week, but as "F. T." may still wish for further advice, I answer his questions seriatim. (1) Yes. (2) Yes. (3) Yes; if B's lights are "ancient," i.e., at least twenty years old, B can prevent such deterioration by obtaining an injunction in Chancery to restrain A in building. (4) Cannot say, as I have not looked it up. The information could be easily found by anyone requiring to do so. The law of "Ancient Lights" is a part of the law of "easements," which goes back to the time of the Romans, if not earlier. "F. T." might if he wishes consult Kerr, Cox, or Fletcher who have written thereon.—HUGH McLACHLAN.

[6674.]—**Roof Strains.**—The calculations of Hurst and Milesworth are easy to work out and I question whether "Engineer" will be able to discover a quicker process. He prefers it he might try the "Graphic method" referred to and partly explained in Tarn's "Science of Building," pp. 194 and 205; the author calls it "Professor Maxwell's method," and says that "several examples of the application of this method will be found in Tarn's 'Lectures on Iron Roofs and Bridges.'" I learnt it from a paper read before the Class of Architectural Science at the Architectural Association in 1874 by Mr. W. W. Robertson and have used it in the finding of the strains to my answer No. 6649; it can be applied further than the formula referred to and I believe will be found if anything more correct.—HUGH McLACHLAN.

[6678.]—**O-Traps.**—In reply to "Enquirer," in your issue of the 24th inst., the O trap he refers to is, in my opinion, one of the best forms made, if its contour is properly followed out. It is so convenient, it is less liable than any other to m to choke or silt up, and it is not possible to use it by either a sudden dash of water or by waving out. Would not some of the disputants in your columns, who have such seeming facility and aptitude for making tests of the greater or less suitability and efficiency of traps, give us the advantage of a test in this instance? It is in such a way that this bottle of traps may be productive of much good—certainly not in acrimonious quill warfare.—PRACTICAL.

[6679.]—**The White House.**—The President's home at Washington, known universally as the White House, is a pleasant building standing a little way back from New York Avenue, immediately in front of Lafayette-square, and a mile and a half from the Capitol. It occupies a site between the Treasury and the War Department Offices. The former is a superb structure, whilst the latter is, perhaps, the most wonderful erection of gray granite in the world. It is certainly by far the handsomest building in that material I ever saw in my life. Our Thames Embankment, in comparison, is simply nothing more or less than a gutter-walk. The architect of the White House was an Irishman named James Hoban. In America he first resided at Charleston, South Carolina. He won the award of \$5000, (one hundred pounds) for the best design, and the building was to due course erected under his supervision. The foundation stone was laid Oct. 13, 1792. The place was first occupied, etc. it was quite finished, in 1800. It cost \$33,250,000. In August 1, 1814, the house was burnt by the British. The next year its rebuilding began, Mr. Hoban being again the architect. It was re-erected after the original plan at a cost of \$14,460,000. (260,200). Mr. Hoban is said to have taken the inspiration of his

design from the Duke of Leinster's Palace at Dublin. This job giving him a good start, he made Washington his permanent home, was ultimately buried in the neighbouring Catholic cemetery, and his descendants still reside in the city. I visited the White House last month during the time the suffering President lay there. It stands like all Washington, upon flat ground, and has two good fronts, each, perhaps, 20ft. long. The gardens around are carefully laid out, and are only separated from the avenues by low iron rails, so that the building, from almost every point of view, is overlooked by the public eye. The country southward is quite open, and the windows face directly across the flat land to the junction of the waters of the Potomac River, with its Eastern branch. The house is not of marble, as its name seems to imply, and as so many of America's fine public buildings are composed of, nor even of granite. It is built of a yellowish-tinged (Virginia, I think) freestone, and this seems to have been painted white from time to time. It is two stories high. In the centre of the north front, i.e., the one facing the main road, there is a fine portico, 80 or 90 ft. wide, and not unlike the one at the west end of St. Martin's-in-the-Fields Church, Trafalgar-square, London. It is carried by eight columns. Upon the opposite or garden front is a semicircular colonnade, occupying a similar position. There is an open balustraded parapet around the top. All the Presidents except Washington have lived at the White House. The earliest was John Adams. After its re-erection Monroe was the first President to take possession. The fact that the building is so overlooked, and has from every point of view a front, produces a lack of convenient privacy. This was particularly suggested to me by the fact that at the open window of the room next to the one where the poor President lay dying, I saw a "bed-tie" and sheets stuffed out to the sill to air. That sort of thing one expects to see in Canongate, and amongst the wynds and purlieus of Edinburgh, but scarcely at the city palace of the President of America. Yet with no "backlet" of any sort in the rear or midst of the premises, what are folks to do? I procured an excellent photograph at Washington of the north elevation of the White House, which I will readily lend for illustration if desired.—HARRY HEMS.

[6679].—**The White House.**—The following clipping is from an American paper:—"I have noticed in several answers to your correspondents, and in at least one article in your valued paper, an allusion to what they call the whitewash on the White House. As I know something of that preparation, I think it proper that I inform you and your many readers. About the year 1835 John Ogden Dey, Esq., a maternal uncle of mine, visited Washington. He was a man of very observant habits, and in his inspection of the White House and the old Capitol building (the central part of the Capitol as it now stands) he found that the stone of which it was erected was being acted on severely by the weather. The outside of the stones had splintered by exposure and contraction and the disintegrating effect of the atmosphere to such an extent as to seriously threaten its permanency. He sought the Committee on Public Buildings, and proposed to remedy the evil, not with stucco, but with a cement wash. After a full interchange of opinion, he was empowered to send the materials and instructions to Washington, which he did, and it was put on the next year, and has stayed there ever since, protecting the building material effectually. The information was given without fee or reward. The old man has passed away long since, and in justice to his memory, as well as to inform the public, I have penned this. The material used was 'Onondaga Hydraulic Cement,' from the State of New York, mixed with a small amount of glue and with milk—the exact proportions I do not now remember. I have seen several brick houses covered with this cement that have stood all kinds of weathers for years. Some I have in mind were washed thirty-five years ago, and still retain the full coat, and look as well as when put on. The cement has to be applied soon after it is mixed, and put on as thick as the brush will carry it. Sometimes two or more coats are required."—JAM. PESTLE.

[6679].—**The White House.**—There has been a correspondence recently in a Midland "daily" with reference to above. A Wolverhampton gentleman writes: "It is built of white marble. I have a piece in the rough of the material brought from Washington," while a Leamington gentleman writes: "It is built of sandstone, and painted white." Johnston's "General Gazetteer of the World" says, speaking of Washington, about 13 miles N.W., is "White House, the official residence of the President of the United States, an elegant edifice, built of freestone, painted white." I think "Scholler" will, with me, think Johnston reliable.—W. B. T.

[6679].—**The White House at Washington.**—There seems to be some difficulty in ascertaining of what material the White House, Washington, is built. In a letter to the *Birmingham Daily Post* last week, signed "J. J. S.," it is stated that "it is built of white marble, of which he has a specimen in the rough brought from Washington." Another correspondent has two guide-books to Washington City, in both of which it distinctly states that the Executive Mansion, popularly termed the White House, is built of sandstone and painted white.—E. W. G.

[6681].—**Beer Stone.**—Through the kindness of the owners I inspected these quarries about two weeks since. The beauty of the stone, the large size of the blocks, its ease in working, freedom from flaws and veins, its uniform tone and fine grain will make it a most valuable stone when better known for internal and high-class work. I was surprised to learn it could be delivered in London at a less cost than Bath stone. It certainly is, in appearance, much superior—in fact, equal to Portland. The owners claim for it equal durability; but of that I have no personal knowledge.—W. H. LASCELLES.

[6682].—**Printed Reports in Competitions.**—It is not usual to distribute printed reports among the committee, especially when other architects on 'y submit one. This is a decided advantage over other competitors. If the conditions state that a written report is to accompany each design it should be complied with, if the conditions are in any way to be followed. The difference seems very trifling, nevertheless conditions should be strictly adhered to, and not set aside with impunity, as some architects invariably do. It only forms a loophole by which the

committee manage to give the job to a favourite, generally a local man. However, one cannot expect any better when the power of selecting a plan rests with the committee, mostly composed of retired grocers, cheesemongers, and the like: a feat of draughtsmanship generally carries off the palm. Architects, however, have themselves to blame, as there are always plenty of black sheep in the profession who would undertake a job for *nil* in order to become associated with an influential committee.—J. F. BELL, Bolton.

[6685].—**Variation of Compass.**—At Folkestone it is 18° 30' W.—JNO. TAEVON.

[6686].—**Hedges.**—In this county (Kent) fields are usually bounded by a hedge with a ditch on one side of it. The owner who plants the hedge sets it sufficiently within his own boundary to enable him to form a ditch between the hedge and the adjoining field, the earth from the ditch being thrown up to form a dyke, on which the hedge is planted. The ditch also forms a right of way for the owner to trim the farther side of his hedge. It will be seen, then, that where a hedge and ditch together form the boundary to a field, they both belong to that field which has the ditch on the farther side of the hedge. About 4ft. 6in. is a usual allowance for the distance from the centre of hedge to outer edge of ditch which forms the boundary-line, but inquiries should always be made as to local customs. A wood fence constructed with nails belongs to that property from which the nails are driven, excepting, of course where it adjoins a public road. A line touching the outmost projections of the fence would be the boundary line between the two properties.—JNO. TAEVON.

[6690].—**Surveyors' Institution Exams.**—The preliminary exam. is held every year in January. The proficiency biennially in April, the next taking place in 1883. Before going in for the proficiency, the preliminary must be passed, or "W. R." must have matriculated or passed in honours the senior local Oxford or Cambridge. Candidate does not become a member of the Institution after passing proficiency. Another exam. must be passed to become an Associate.—NADA.

STAINED GLASS.

CREWKERNE.—A stained-glass window has been placed in the parish-church as a memorial to the late vicar, the Rev. H. T. Breay. It occupies the east end of the Archdeacon's aisle, and consists of five lights. Each of these is filled with the representation of an act of mercy. In the central light is the Saviour, surrounded by children and with a child in His arms, blessing them, and beneath is the text, "Suffer little children to come unto Me." The other lights depict the feeding of the hungry, the giving of drink to the thirsty, the clothing of the naked, and the visiting of the sick—the texts under them being respectively, "Was an hungry and ye fed Me," "Was thirsty and ye gave Me drink," "Was naked and ye clothed Me," "Was sick and ye visited Me." Over each subject is a canopy, and the tracery above is filled with angels while beneath the window is an inscription. The artists are Messrs. Gibbs, of London.

ST. ALBAN'S.—On Friday afternoon the east window of the Lady Chapel, which has just been restored at the expense of the Corporation of London, who have also caused it to be filled with stained glass, by Messrs. Burlison and Grylls, was unveiled.

BATH.—A stained-glass window has been placed in St. Andrew's Church, Bath, in commemoration of its completion. It occupies the east end, and contains in the lower part three tiers of worshippers, typifying the Holy Church. Above is Our Lord in Glory, surrounded by Angels, Archangels, Seraphs, Apostles, Prophets, and Martyrs. The window is the work of Messrs. Burlison and Grylls, London, and cost £300. Beneath is an inscribed tablet, formed of an oblong slab of Rosso Antico marble, with gilded lettering. This was designed by Mr. J. Eldridge Scott, and executed by Messrs. Farmer and Brindley, of Westminster Bridge-road.

The city council of Lichfield considered last week a recommendation from Mr. Griffiths, C.E., that some allowance should be made to Messrs. Drevitt and Pickering, who have just completed the sewerage contract, as they were £120 out of pocket by the work. The mayor stated that, although it was evident some mistake had been made in the accepted tender, yet the work had been honourably carried out. Several members said that to recompense the contractors for their own error would be establishing a dangerous precedent; but eventually it was carried by a bare majority of votes that the sewerage committee make an allowance at their discretion, the maximum to be £75.

The new buildings of the Young Men's Christian Association at Carnoustie, near Dundee, were opened on Tuesday by Earl Dalhousie. They include a hall on ground-floor and a reading-room over the south end capable of utilisation as a gallery to hall. Accommodation is provided for 400 persons, at a cost, including ante-room and caretaker's house, of £600. Messrs. C. and L. Owen were the architects, and the principal contract, that for masonry, was taken by Messrs. A. and J. Black, Messrs. D. Buck and Son being the joiners.

LEGAL INTELLIGENCE.

IN RE W. SMEATON AND SONS.—(Court of Bankruptcy.—Before Mr. Registrar Hazlitt.)—A first meeting for the proof of debts and the appointment of a trustee was held under an adjudication against Messrs. William, John, and William Mills Smeaton, plumbers and sanitary engineers, carrying on an extensive business in Moorgate-street and elsewhere. They presented a petition for liquidation in July last, with liabilities estimated at £20,000; but at the first meeting the proceedings fell to the ground, and an adjudication of bankruptcy followed. Considerable discussion took place upon some of the proofs, and eventually debts amounting to about £7,000 were proved, and the creditors appointed Mr. H. W. Banks, accountant, trustee of the estate, with a committee of inspection. The assets are stated to be uncertain in value.

IN RE BURFORD.—(Court of Bankruptcy.—Before Mr. Registrar Hazlitt.)—This was a rather heavy failure in the building trade. The debtor, James Burford, who has presented a petition for the liquidation of his affairs, is described as of Norway-house, High-street, Hampstead, builder; and his liabilities are stated at £31,500 in the aggregate, with assets £48,000, consisting of stock-in-trade, plant, book debts, goodwill, and securities in the hands of creditors. Mr. Ernest Field, solicitor, applied for the appointment of Mr. Joseph Andrews, accountant, as receiver and manager of the business, and for an injunction to restrain numerous actions. The evidence showed that the debtor was engaged in several contracts which should be completed for the benefit of the creditors, and there were also the wages of workmen to be paid. Mr. Registrar Hazlitt made the proposed appointment, and granted an injunction until after the first meeting of creditors.

POLLUTING THE THAMES.—At the Henley Police-court on Thursday week the Thames Conservators summoned the rural sanitary authority for polluting the Thames by allowing the drainage of Caversham to enter the river. The case excited much interest, and the defence set up was that the authority had done their utmost to prevent the pollution. Mr. Wimmer, the analyst to the Conservators, proved that the sample of water taken at the drain was concentrated sewage, and caused by old sewage matter being allowed to run into the river. Ultimately the Bench inflicted a penalty of 40s. Notice of appeal was given.

"BLESSINGS TO TENANTS" AND THEIR RECOMPENSE.—At Stratford police-court, on Wednesday, the Rev. F. Bousfield, of Lonsley House, Princes Risborough, was summoned by the Leyton local board for not complying with a notice to abate a nuisance at four cottages, near Forest-place, Leyton. The inspector of nuisances, the surveyor to the local board, and the medical officer of health, stated that the houses were in a fearfully dilapidated state, the plaster falling from the walls, large holes existing in the ceiling, the floors breaking up, and the closets in a filthy state. Pigs were allowed to run about the lower rooms, and the place was quite unfit for habitation. Scarlet fever had broken out, and in one house six cases had occurred; three cases had terminated fatally. The first order was made by the board in July last. The reverend defendant contended that the houses were perfectly healthy, and that it was a blessing to the tenants to be allowed to live there. The proceedings, he added, were hard and tyrannical, and it was a shame that he should be called upon to expend about £1,000 over them for nothing. The magistrates, however, made the order as asked, and allowed a month for the performance of the work.

BREACH OF BUILDING ACT.—(Worship-street, Sept. 22, before Mr. Hannay.)—W. H. Middleton was summoned by the district surveyor for East Hackney (North) for £159 1s. 4d. for expenses incurred under the 47th section of the Metropolitan Building Act, 1855, in rebuilding walls of less than the minimum thickness allowed, and of raising stories of less than the minimum height of a block of five houses at the corner of Castlewood and Mountfield-roads, Craven-park, Stamford-hill. The works were carried on in December and January last, at which time the defendant was owner, but he became bankrupt in January, shortly after the completion of the works. An account of the expenses named was served on him in June last. The magistrate considered the defendant was not liable, as he being then a bankrupt could not be said to be in receipt of the rents or profits when the account was served on him. Summons dismissed.

Two large blocks of business premises of red brick, with freestone dressings, and semi-Renaissance in style, have just been completed in the Walworth-road, S.E., near the Elephant and Castle station. Mr. Benjamin Taber, of Coleman-street, E.C., was the architect, and Mr. Richard Conder, of Ball's Pond-road, Dalston, the builder.

Our Office Table.

THE operations in connection with the tunnel which the Mersey Railway Company are boring under the Mersey, from Liverpool to Birkenhead, are being rapidly pushed forward. On the Birkenhead side the permanent pumps are now in position, and continuous work night and day, with three shifts of workmen, has gone forward with the test or drainage heading. The length cut last week was eleven yards. This is all done by hand, with the aid of explosive gelatine, the confined space making the application of boring machines difficult. This heading is now well under the river, and no increase of water is perceptible. In fact, the water does not now present any feature of difficulty, and the engines keep that under even when working dead slow. The company's engineers and the contractor have now decided that the main tunnel shall go forward at the same time as the drainage heading, and permission has been obtained for the Mersey Dock Board to sink a second shaft close to the existing one, in order to expedite this work, and this has already been carried down a considerable distance. On the Liverpool side less rapid progress has been made, owing to the fact that the upper part of the shaft had to be sunk through made ground, and also on account of the confined space on the quay within which the work has had to be carried on. It is in contemplation to apply for permission to sink a second shaft on the Liverpool side, and this will shorten the time for the completion of the railway by a period of nearly six months.

On Saturday the fourth annual Fine Art Exhibition was opened at Dundee. The sales of pictures at the Exhibition of 1879 amounted to about £4,000; last year they ran up to £5,000—not far behind the proceeds of the Royal Scottish Academy sales. The present Exhibition may not unlikely show a further advance in this important particular of finance. There are fewer paintings in oil than there were last year—797 as against 860. On the other hand, there are no less than 631 works in water-colour, and an interesting collection of 136 etchings is this year added for the first time to the attractions of the Exhibition. Altogether, including the sculpture, the works embraced in the collection number over 1,600, or some 180 more than in 1880.

Rumours are abroad about an Art City to be founded somewhere in the backwoods of America, of which all the denizens are to be artists, musicians, or artists, or the like. Those still in active life will retire there for their holidays; whilst others, tired of the world, but still eager for art, will be retained permanently to form a "focus of art instruction," which will render it unnecessary for young American art students to come to Europe to study. One of the primary conditions is the exclusion of all art critics from the sacred precincts of the art city. If only some of the artists, musicians, "or the like," we know will betake themselves to the new art city we think they need not fear the art critics following them!

THE huge vase sculptured by the late Sir Richard Westmacott, with bas-reliefs to commemorate the Battle of Waterloo, has been taken to pieces, and now, although covered by tarpaulin, may almost be said to "lie naked to the injuries of stormy weather" in the private road bounding the precincts of the buildings of the South Kensington Museum. A few months ago it stood in a corner of the north court of the museum—a court which had been devoted to the technical illustration of sculpture. But when a rearrangement of objects in the museum was set on foot, the Waterloo Vase, an historic link in the chain of British sculpture, had to take its departure to permit the bringing together of all the Italian works of art the Kensington Museum possesses. An ethnical super-added the technical arrangement of objects. Before the Waterloo Vase came to South Kensington it stood in the vestibule of the National Gallery in Trafalgar-square. In time, however, the incompatibility of sculpture with painting drove the vase from Trafalgar-square. The production of the vase was a costly undertaking, instigated by popular acclaim of martial deeds, and paid for by the nation. The Carrara marble out of which Sir Richard Westmacott carved it was, Mr. John Thoms says in his "Curiosities of London,"

captured from the French, who had intended it for a vase to celebrate the triumphs of the First Napoleon.

THE Science and Art Department have commenced the translation of the inscriptions which are to be found on so many of the objects the India Museum contains. The work will be carried on under the direction of Mr. A. N. Wollaston, examiner in Persian at the Royal Military College, Sandhurst, and translator of the "Auvai-i-Suhali," who has secured the services of Mirza Muhammad Bakar as his assistant in making the translations. The Mirza, late of the British Residency at Bushire, is a most accomplished Persian and Arabic scholar, and known in Persia as one of the first native poets of his time. The Science and Art Department will begin the work of translation in the India Museum, but should it prove to be advantageous—of which there is not the slightest doubt—it will, it is anticipated, be continued until all the inscriptions on the various art objects in the Persian collection also have been rendered into English.

THE Custom House of the City of London is about to undergo some improvements and additions. The present building in Lower Thames-street is the fifth erected for the purpose of collecting the customs at the port of London on nearly the same site. The first was built in 1335, by John Churchman, who was then Sheriff of London. The second was erected in the reign of Queen Elizabeth, and appears in a view of London published in 1543, with several high gables and a water-gate. This building was destroyed in the great fire of 1666. The Custom House was shortly afterwards rebuilt by Sir Christopher Wren, and this structure was also destroyed by fire in 1718, being the only edifice erected by this great architect which was burned in London during his lifetime. This building was replaced by one by Ripley, which in its turn was again consumed in 1814. The present structure was erected 1814-17, from the design of David Laing, but in consequence of some defects in the piling, the original centre gateway and the present river front was constructed under the instructions of Sir Robert Smirk.

THE annual exhibition in connection with the Birmingham School of Landscape Art is now open. In the landscape art class the first and fourth prizes have been awarded to Mr. A. Marlow, the second to Mr. J. Billingsley, and the third to Mr. J. Terris, while honourable mention is made of Mr. A. J. Langston. In the elementary drawing classes, Mr. T. A. Smith has been awarded the first prize, Mr. T. W. Hands the second, and Mr. J. C. Moore is thrice honourably mentioned. The exhibition is of a very varied character, and comprises nearly every kind of study which can be said to come within the range of landscape art. Elementary drawings by the students are also exhibited. The exhibition remains open until the 15th inst.

CHIPS.

The local board of Ystradgynaf are about to carry out the drainage and sewerage of the Rhondda Valley from plans prepared by Mr. Lomax, C.E. It will be executed under the supervision of Mr. J. W. Jones, surveyor to the local board.

An iron chapel, seating 250 persons, and built at a cost of £300, was opened at North Skelton, Middlesbrough, on Sunday. Mr. Wm. Sanders, of London, was the builder.

The Mynyddyswyn School Board have adopted the plans of Messrs. A. O. Watkins and Son, of Newport, Mon., for additional school-buildings at Newbridge, Monmouthshire.

A chancel-screen has just been erected in St. John's Church, Lichfield, from the designs of Mr. W. H. Crompton, of that city, by whom the church was restored about ten years since. It is of oak, and consists of five arches, the central opening being surmounted with a cross. Mr. Baunister carried out the work.

A new post-office is in course of erection in Broad-street, Hereford. It has been designed by Mr. E. J. Rivers, of her Majesty's Office of Works, and is Jacobean in style, the street-front will be of brown Portland-stone. Mr. William Bowers, of Bath-street, Hereford, has taken the building contract, Mr. S. Ruddock, of London, is executing the carving, and Mr. H. Luff is the clerk of works. The cost will be about £5,000.

New board-schools are about to be opened at West Hill, Cannock, Staffordshire. Mr. B. Baker is the architect, and Mr. Guest the contractor.

A new lighthouse at Anville, St. Darlestone's Head, near Swanage, was inaugurated by the President of the Board of Trade on Thursday week.

New warehouses and offices have been erected at Micklehurst, Ashton-under-Lyne, for Messrs. Radcliffe Brothers. A rearing supper was given the other evening to the workmen in the employ of Mr. Taylor, by whom the contract was carried out.

The annual meeting for the distribution of prizes to the successful students in the Dudley school of art was held on Michaelmas Day. It was stated that there had been a marked improvement in the work done, and that the amount of grant earned was £122 8s., as against £99 19s. 6d. last year, while thirty-five Queen's prizes had been gained.

The pinnacles and upper portion of "Tenterden steeple" are under repair by Mr. C. Faith, of Coventry.

A stained-glass memorial window was last week placed in the north side of All Saints' Church, Hereford. It is a decorated window of three lights, and is occupied by life-size figures, representing Martha, Mary, and Lazarus, as representative of Hospitality, Devotion, and the Resurrection. The work has been executed by Messrs. Clayton and Bell, of Regent-street, London.

The Dublin Corporation have promoted Dr. C. A. Cameron, their medical officer of health and city analyst, to the entire charge of the Public Health Department, with a salary of £1,000 a year.

The following cynical definition is given in the architectural section of the *Artist*: "SQUIRE.—A roof prolonged upwards into an advertisement."

At the Glasgow Dean of Guild Court on Thursday, the 29th ult., the retiring dean, Mr. D. Milne, gave some statistical details of the value of property erected in the city during recent years, which showed a continuous falling off. In 1880, the value of property which had been passed by the Court was £397,640, compared with £431,000 in 1879, and £755,000 in 1878. The total value of property erected in the past three years was £1,550,000, which fell considerably below the amount for the single year of 1876, when the plans which passed the Court represented property valued at £2,125,000.

An oak screen has been placed on the west side of the organ in Luernton Church, near Tavistock, an edifice recently rebuilt after destruction by fire. The screen was designed by Mr. J. Piers St. Aubyn, of London, and was carved by Mr. Montrie, of Tavistock.

The Plympton rural sanitary authority are about to carry out a scheme by Mr. Shiers, C.E., for supplying water to the village of Pomphlett.

The town-council of Newark-on-Trent were informed on Tuesday that Mr. W. Gilstrap, of Farnham Park, Bury St. Edmund's, had bought the present cattle-market as a site for the free library which he proposes to build and present to the town. The market will probably be removed to land on the opposite bank of the Trent to a site which will be raised above flood-level.

With reference to the paragraph in our last issue entitled "A Powerful Light," it may interest our readers to know that this light is driven by two of Crossley Bros. Otto 8 h.p. silent gas-engines.

The foundation-stone of a new Sunday-school, in connection with Cottage Green Baptist chapel, Camberwell, was laid on Wednesday week. The school is situated at the rear of the chapel, and is of Gothic design, faced with red brick and sandstone dressings. It consists of a central hall with galleries, having class-rooms opening into the main building on both area and gallery levels. Accommodation will be provided for 500 children at a cost of £1,500. Mr. John E. Sears, A.R.I.B.A., son of the pastor, is the architect, and Mr. John Marsland, of Walworth, the contractor.

Saucreed church, West Cornwall, which had fallen into an extremely dilapidated state, has just been restored at a cost of £2,150, and was reopened on Monday. Mr. J. D. Sedding, of Bedford-square, London, was the architect.

Mr. S. Woodall, of the Windmill Works, Dudley, has obtained the contract for the making of a swing-bridge 150ft. span, and 40ft. wide, to be erected at Caiao.

At a preliminary meeting of the Nar Valley Drainage Commissioners, held at King's Lynn last week, Mr. Martin Ffolkes was appointed engineer to the board, and was instructed to prepare a plan of district and a scheme.

A new English Baptist chapel was opened at Blackwood, near Cardiff, on Thursday, the 29th ult. It is built of Pennant stone, and furnished with pitch-pine seats and rostrum. Mr. John Thomas, of Gellihiir and New Tredegar, was the contractor.

Truth states that the Dean and Chapter of St. Paul's have commissioned Sir Frederick Leighton and Mr. E. J. Poynter, R.A., to make on probation designs for a series of paintings to decorate the cupola of the cathedral, in place of those of Thornhill, and to paint each one picture also for approval.

An organ is in course of erection in the Guildhall, Cambridge, at a cost, raised by subscription, of £1,500. Messrs. Hill and Son, of London, are the builders.

A new dry dock at Cardiff was publicly opened on Thursday last week. It is situate between the West and East Bute Docks, and is the largest but one in the Principality, having accommodation for two 2,500 ton vessels at the same time. The dimensions are 420ft. by 76ft. and 20ft. deep, and the cost has been £60,000. It is intended to light it by electricity, so that work can be carried on by night as well as in the day. Mr. C. W. Jacobs is the consulting engineer. Messrs. Kirk and Randall, of London, carried out the iron work under the supervision of Mr. James McConchie, C.E.

A new railway-station at Uttoreter, erected by the North Staffordshire Railway Company at a cost of £15,000, was opened last week.

At Gipsy-road, Norwood, the foundation-stone was laid on Tuesday week of a new Baptist chapel and schoolroom. The style of the building will be Early English. Over the schoolroom will be the chapel, which will have a gallery on three sides, reached by distinct entrances and stone staircases. The walls will be plastered internally, the roof open-timbered, and the windows filled with lead glazing, and at the further end will be a circular-freented platform with preaching rostrum; 740 seats are to be provided. The contract has been taken at £3,336 by Messrs. James Smith and Sons, of South Norwood, and the architect is Mr. Hampden W. Pratt, of Fumival's Inn, whose design was selected in competition.

In the BUILDING NEWS of last week it was stated, "Mr. Bevan has also just been appointed architect to the Paulton Burial Board for certain works in connection with Holy Trinity Church, Bristol." It should have been—Mr. Bevan has also just been appointed architect to the Paulton Burial Board, and for certain works in connection with Holy Trinity Church, Bristol.

EXAMINATION under the METRO-

POLITAN BUILDING ACT 18 and 19 Vict. cap. 122 (sect. XXXIII.) The Board of Examiners appointed by the Royal Institute of British Architects to examine all persons presenting themselves for the purpose as to their competency to perform the duties of DISTRICT SURVEYORS IN LONDON, and to grant CERTIFICATES to Candidates deserving of the same, will hold an EXAMINATION on the 27th and 28th inst. Each candidate must, on or before FRIDAY, the 21st inst., send to the secretaries an APPLICATION, which must be accompanied by a statement drawn up according to a form to be previously obtained from them, and each Candidate will be required to attend at the ROYAL INSTITUTE OF BRITISH ARCHITECTS on THURSDAY, the 27th inst., from 10 a.m. until 1 p.m., and from 2 p.m. until 5 p.m., for the WRITTEN and GRAPHIC Examination, and on FRIDAY, the 28th inst., at 12 noon, for the ORAL Examination. Each Candidate, on sending in his formal statement and application, must pay to the Royal Institute of British Architects a fee of TWO GUINEAS, and each Candidate, on receiving his certificate, should the same be granted to him, must pay to the Institute a further sum of THREE GUINEAS. No person will be admitted to the Examination unless he declare that he intends to offer himself as a Candidate for the office of District Surveyor in London.

J. MACVICAR ANDERSON, Hon. Sec.

WILLIAM H. WHITE, Secretary.

Royal Institute of British Architects, 9, Conduit-street,

Hanover-square, London, W., 1st October, 1881.

MEETINGS FOR THE ENSUING WEEK.

MONDAY.—University College, Gower-street, W.C. Public introductory lecture on "The Mode of Studying Architecture for Examinations." By Prof. T. Roger Smith. F.R.I.B.A. 6 p.m. Admission free.

Epps's Cocoa.—Grateful and Comforting.—"By a thorough knowledge of the natural laws which govern the operations of digestion and nutrition, and by a careful application of the fine properties of well-selected Cocoa, Mr. Epps has provided our breakfast tables with a delicately-flavoured beverage which may save us many heavy doctors' bills. It is by the judicious use of such articles of diet that a constitution may be gradually built up until strong enough to resist every tendency to disease. Hundreds of subtle maladies are floating around us ready to attack wherever there is a weak point. We may escape many a fatal shaft by keeping ourselves well fortified with pure blood and a properly nourished frame."—*Civil Service Gazette*.—Made simply with boiling-water or milk. Only in Packets labelled—"JAMES EPPS AND CO., Homoeopathic Chemists, London."—Makers of Epps's Chocolate Essence for afternoon use.

Lamplough's Pyretic Saline is refreshing, most agreeable, and the preventive and curative of FEVER, BILIOUSNESS, SMALLPOX, SKIN DISEASES, and many other ailments. Sold by chemists throughout the world, and the Maker, 113, Holborn Hill. Use no substitute. See Medical Testimony.

Holloway's Pills and Ointment.—Dyspepsia, Jaundice.—These complaints are the results of a disordered liver, which secretes bile in quantity or quality incapable of digesting food. Digestion requires a free flow of healthy bile, to insure which Holloway's Pills and Ointment have long been famous, far eclipsing every other medicine.

Doubling Freestone and Ham Hill Stone of best quality. Prices, delivered at any part of the United Kingdom, given on application to CHARLES TRASK, Norton-sub-Hamdon, Ilminster, Somerset. —[ADVT.]

McLACHLAN & SONS, 35, St. James's street, S.W. Builders, Decorators, and House Painters. Designs and Estimates. General Repairs and Alterations Executed. Experienced Workmen always in readiness, and sent to any part of the country.—[ADVT.]

BATH STONE. BOX GROUND, THE BEST FOR ALL EXTERNAL USE CORSHAM DOWN

CANNOT BE SURPASSED IN BEAUTY OF APPEARANCE FOR INTERIOR WORK.

PICTOR & SONS, BOX, WILTS. (See trade advt. on p. XXIII.) ADVT.

TENDERS.

Correspondents would in all cases oblige by giving the addresses of the parties tendering—at any rate, of the accepted tender—it adds to the value of the information.

ARCACHON, FRANCE.—For warming and ventilating by their new hydro-caloric apparatus, the dwelling-house, and billiard-room, Villa Hermosa, Arcachon, France, for Mr. W. Laird McGregor: Weeks, J., and Co., Chelsea ... £180 0 0

For severing portions of Gower-street, Gower-street, and Wilton-street, for the local board. Mr. J. W. Brown, surveyor:—		Gower-street.		Wilton-street.		Gower-street.		Wilton-street.	
Wallis, A. G., Birmingham	...	£157 0 0	£210 0 0	91 0 0	183 0 0	146 0 0	£100 0 0	85 15 0	172 12 4
Hilton, H., Birmingham
Cutwell and Lewis, Birmingham
Fulmer, A., Birmingham
Jones and Fitzmaurice, Birmingham
*Accepted.									

BANSTEAD, SURREY.—For the erection of additional schools, &c., for the accommodation of about 500 children, in the Banstead-road, Sutton, for the managers of the South Metropolitan School District. Mr. W. Waller, architect. Quantities by Messrs. Franklin and Andrews:—

Macgregor, W. D., London	...	£108,615 0 0
Tyerman, J., London	...	95,269 0 0
Kimbrey, A., Banbury	...	94,276 0 0
Jones, D. C. and Co., Gloucester	...	92,847 0 0
Shepherd, W., London	...	91,6 0 0

Accepted tenders:—	
Masonry:—John Turner.	
Carpentering and joinery:—Samuel Fox, Soewery Bridge.	
Slatting and plastering:—George Hoyle, Triangle.	
Plumbing and glazing:—J. W. Helm.	

THE BUILDING NEWS.

LONDON, FRIDAY, OCTOBER 14, 1881.

TOWN CHURCHES.

MR. BODLEY'S paper, read at the Church Congress, and which we reported last week, was an able and interesting one. We do not here either endorse or discuss the first abstract proposition of the author, that high art cannot exist, or, at least, cannot thrive without religion: we confine our attention to the more practical part of the address. With respect to churches, larger buildings were advocated, with outlying chapels; but the question naturally arises whether such a system would work well in large towns. No doubt a large church has an influence; but we must have something like unanimity in ritual first, and this is a point on which the speaker did not touch. It is, perhaps, a regrettable fact that while we are making our domestic buildings more complete, our churches are becoming less important, yet we cannot expect our ecclesiastical edifices to assume the monumental character and architectural significance they formerly possessed. It is unnecessary to allude to the causes which render such a condition of things impossible; but if a wide latitude of doctrine and ritual be allowed, such as the Dean of Durham the other day contended for in the Anglican Church, one effect certainly will be the reduction in size of our English churches to buildings having a congregational capacity proportionate to the wants of a locality.

Mr. Bodley said truly, nothing is so impressive as height, and for churches in towns this element seems one which is of far greater consequence than in the country or in open districts. Churches in densely-crowded streets can only be effectually lighted by clerestories, and this consideration seems to point necessarily to buildings of some height, in which the clerestory is made a feature. We could mention many London churches where gas is required, even at the early services, during the greater part of the year. Ample entrances and passages are more important still, and fixed seats are always undesirable, and should not be made the test of accommodation. Mr. Bodley proposed that an open iron grille of some height be fixed to screen off a part of the west-end for the casual worshippers' use, the door being kept open all day. This is a good and sensible suggestion, and might be made a feature. Our church entrances are usually meagre and insignificant, and they are cased off by matchboarding or panelling, which rather tends to repel than invite the stranger. There are other considerations, however, than purely artistic or religious ones. How would the regular worshipper like to be subjected to cold blasts of air in wintry weather, which almost render the small wooden vestibule a necessity? Whatever else an Englishman worships at church, he certainly worships comfort. Some other heating arrangements than we have at present seem necessary to render an open porch practicable. A better architectural effect could be gained than we generally get, by forming a recessed vestibule open to the street, groined inside, with a glass screen enabling those passing by to obtain the perspective or vista the author of the paper suggested.

With respect to vaulting, it is also perfectly true that this feature lends dignity and monumental solidity to a church, and does not very greatly add to the cost. An open-timber roof is not always desirable, and

even a boarded vault is liable to be destroyed by fire, as in the case of the new church at Whitechapel. There are, notwithstanding, considerations which do not add to our appreciation of the stone or brick vault. To mention two practical objections,—the vaulted roof is expensive, inasmuch as it necessitates either walls of increased thickness or deep buttresses; and it seldom insures the best acoustic effect internally. These are points of sufficient weight to justify reference. Unfortunately, a lofty vaulted ceiling of stone is in conflict with good acoustical results, and our cathedral churches bear ample testimony to the deadening effect on sound of a lofty ceiling of masonry. High open-timber roofs are sometimes equally defective as regards the conveyance of sound; the waves are broken up or lost, and a low, flat ceiling is frequently to be preferred. We have, therefore, rather conflicting wishes to harmonise; the artist is quite right in saying dignity and impressive interior effect is so to be gained by vaulted ceilings, but the experience of those who preach and sing in churches of this kind is certainly against them. The flat elliptical or pointed ceilings of plaster common during the eighteenth century are better and more resonant, and if voice and hearing are to count for anything, architects have to study their claims for adoption. That upon the interior of our churches more sculpture and painting may be lavished, and more decoration employed, we are quite ready to admit; but let the sculpture be good and the painting a little higher than cheap decoration. The record of Christian events might be profitably employed in frescoes or mosaics upon the walls, and there can be little said against making the walls of the sacred edifice teach the people objectively. Our great care, however, should be to prevent a tawdry kind of decoration, and not to bespatter the walls with ornament. Mr. Bodley was careful to point to the value of concentration of ornament—a restraint on the resources of decoration; and every artist is well aware that a severely plain edifice with real art in points of interest—such as the choir and altar—has more lasting effect upon the mind than an interior covered with cheap and lavish ornament, either in colour, sculpture, or pictorial incident.

THE PHOTOGRAPHIC SOCIETY'S EXHIBITION.

THE Annual Exhibition of Photographs, held by the Photographic Society of Great Britain, at the gallery of the Society of Painters in Water Colours, 5, Pall Mall East, may be considered fairly up to the average, if there are indeed fewer striking novelties to notice. The great feature of the present exhibition is the revolution which has lately been effected in this art by the substitution of the gelatine dry plate for the wet process. The walls furnish abundant proof of the fact that the use of dry plates has resulted in vigorous pictures full of delicate detail, brilliancy, and pleasing colour. In looking over the numerous photographs which adorn the walls, we notice first on entering the gallery the beautiful collection of Swiss and other views on gelatine plates prepared by Mr. William England, and numbered from 3 to 20. The Valley of Chamounix (No. 6), is a charming transcript of atmosphere and clouds taken with one exposure; the views of the Matterhorn, Zermatt, Mont Blanc, Geneva, &c., are brilliant specimens of the art. Mr. England obtains a medal for his very fine-toned picture of Mont Blanc Range. Near it Mr. E. Fox exhibits views of the Alexandra Hospital for Sick Children at Brighton, taken by the wet collodion process. One of the most marvellous series of marine views taken on gela-

tine plates is by Mr. Matthew Whiting, representing views off Dover, at Purfleet, &c. They are wonderfully brilliant, clear, and sparkling; the rippled water and sunlight are excellent, and as examples of instantaneous photography and artistic effects, there is nothing to surpass them in the room. Mr. Whiting well earns a medal. Mr. Annan's view, "The Stepping Stones" (25), enlargement, silver print, is bold, and we cannot pass by a vigorous and delicately-manipulated enlargement from gelatine plate by Mr. F. Thurston, entitled "Frosted Trees." Mr. W. Bedford as usual has some fine works. His view on the Monnow, for which a medal is given, is a lovely bit of light fleecy foliage, and the views on the Wye are no less remarkable for crisp detail and artistic light and shade. As examples of wet collodion, the English Lakes, by the School of Military Engineering, surpass for technical execution and rich colour any we have lately seen. The view of Grisedale from Ulswater, The Tree Study (69), and the view on the Ulswater are remarkable for the crisp leafage, the stems and branches and water, and we might imagine we were looking at monochrome studies. Nothing can surpass the grand foliage and its vigorous light and shade in 68 and 69; the colour is a deep reddish brown, and there is a degree of opacity which takes off the feeble monotony of ordinary photographs. Some marine views, by Mr. Joseph Gale, who receives a medal, are clever. Captain G. H. Verney sends some fine architectural subjects at Nimes. The triumphal arch, the Roman amphitheatre, and the aqueduct are splendid remains of Roman work in this part of Southern France. The detail in No. 124 is delicately rendered. St. Mark's, Venice, by Mr. A. Pringle, and view from Christchurch tower, Hants, by Mr. A. J. Spiller, are good gelatine specimens.

Landscapes, mountain scenery, studies of children, and portraiture make up the largest part of the gallery. We may refer in general terms to the admirable work of the Autotype Co., who have developed the resources of the art in the reproduction of several drawings. Their portraits are masterpieces of photographic enlargement. We instance the large full-size studies of Mme. Neilson as Helen of Troy, from negatives by Messrs. Downey. No. 164 occupies a pre-eminent position at the end of the gallery, and a grand view of Holland House (198) from a negative by Vernon Heath, illustrates the beauty and detail of the work of this Company for architectural purposes. Near these we notice a large-size portrait of a lady; the softness of expression of the countenance is heightened by the highly-finished manner in which the features have been touched up. This portrait is from negative by Messrs. Downey. The Autotype Co. show some excellent specimens of their collotype process, and they have introduced a sensitive gelatine dry plate, which produces a bold and well-detailed negative. Messrs. W. Cobb and Son (134), Messrs. James Valentine and Sons in "Views in Scotland" (142) send good work; and "Gleanings from the Farm," printed from gelatine plates with optical modifications, by Mr. Lyddell Sawyer, illustrate some clever effects. We most particularly call attention, in studies of still life, to Mrs. S. G. Payne's beautiful grapes and flowers (151), in which the bloom is almost realistic to a fault, if one could indeed find fault with such an artistic group. The floral studies and the game and fruit, by the same lady, show good grouping, texture, and exquisite finish and sharpness. Capt. Abney, R.E., sends a series of interesting Swiss views. No. 163, "Summer," is a pleasing study of a girl, by Mr. A. Debenham. A group including the Premier and Mrs. and Miss Gladstone, at Deal Castle, by Mr. J. Berryman, makes a good picture. As an example of instantaneous

photography (No. 217) "The Thames off Greenwich," taken from a steamer going 12 knots an hour (printed in platinum) by Messrs. W. Cobb and Son, may be mentioned for its sharp definition and clearness. The amusing group entitled "The Brighton Cats and Dogs" will enlist attention for grouping and expression, as well as interest old ladies and spinsters.

Architectural subjects are, if not plentiful, fairly represented. We have already mentioned a few and, notably, the grand view of Holland House, by the Autotype Co., and we now call attention to Mr. Henry Dixon's well-deserving endeavour to record, by photography, the relics of Old London. Ashburham House (227), of which five views are shown, is the only specimen exhibited by the Society whose object it is to preserve impressions of old buildings. The staircase, a fine Italian example, is, perhaps, the most interesting feature of the series. We may also notice "Carnarvon Castle" (219) from a painting; "Alford House, Sussex" (253), by Mr. J. Gale; Mr. A. Hill's "St. Alban's Abbey" (348); but more especially the very admirable series of views, "Old English Houses," by Mr. Vernon Heath. These include Raby Castle, Penshurst Castle (1250); Andley End, well known to all admirers of the architecture of James I.; Easton Neston; Coleshill House, dated 1625; Moor Park; Bisham Abbey, east front (1200); Dorton House; Kentchurch Court, Hatfield (1611); the Oaks, Epsom; Stoke Pogis Manor House; Broome Park, Chirk Castle, Charlton and Holland houses. Coleshill House and Moor Park, of the Roman style, common in the time of George I., are interesting just now. The "Relics of a Bygone Age," by Mr. Seymour Conway, include bright and sharp photographs of Fountains and Rievaulx Abbeys, in which the definition and detail are good; and Mr. Arthur Hill sends two specimens in "Canterbury Cathedral and Knele House" (494). The fine prints from gelatine plates shown by Mr. J. Thomson, F.R.G.S., of Lion and Lioness at the Zoological Gardens, and the Animal Groups (enlargements) by Mr. J. T. Dixon, leave little to be desired. Mr. G. E. Alder shows some capital portraits (243-245) taken without daylight, by the Luxograph gelatine plate; and Messrs. Hunter and Sands' "Group of Boys from Foundling Hospital," done by their "instantaneous shutter," is a clever specimen of sharp definition. We can only mention a few other photographs which call for notice in a speedy review. Mr. H. P. Robinson's series of gelatine-plate studies (264-272) are vigorous and deeply-toned in colour. Capt. Abney's views in Switzerland show also the admirable capabilities of the same process. Mr. Owen G. Bird exhibits some rapid photography of lawn tennis, archery, and cricket exceedingly well, illustrating the powers of gelatine plate under skilful manipulation. Lieut. Darwin's "English Lakes," by dry and wet processes, call for attention from the student; while, for portraiture, the outdoor portraits taken on the terrace of the House of Commons, by Messrs. Russell and Sons; Mr. Mendelssohn's fancy studies (336); Miss Violet Cameron, by the Woodbury Co.; and several others by the same firm, require a word of praise. On the screens we particularly notice the selections from the views taken among the Great Andes of Ecuador in 1879-80, by Mr. E. Whymper, a series of natural mountain summits of great altitude, and objects of pottery, all autotype enlargements. The archaeological interest attaching to this series is great, and the views of the volcano, the summits of Chimborazo, &c., are interesting to the student as having been taken at very great altitudes. The exhibition is well worthy of a visit, as it indicates the progress of an art which is gradually pushing its way in spite of many obstacles and technical difficulties.

ST. PANCRAS INDUSTRIAL EXHIBITION.

THE exhibition just opened at the Institute in Drummond-street, quite maintains its past character. Among building appliances we notice several contributions in the lower room, besides a few drawings or designs of a rather mediocre description. The drawings for sanitary plumbing by Samuel Fairchild, plumber, may be taken as an indication of improved sanitary knowledge among the plumbing fraternity. The author shows the closets placed in a separate building or tower, with tubes carried up with cowl tops, one as an inlet to the drains and the other as a ventilator. The wastes, &c., are all disconnected from the drains. We have seen these drawings before. A sanitary cottage shows a rather objectionable arrangement—a drain carried through the house. C. Maynard Walker is the exhibitor of a valveless water waste-preventing apparatus for flushing, and Dougald Leah a tin-plate worker, sends an improved house sink-trap, the advantage of which is that the water-seal is attached to the grating, and is not liable to be left dry by careless servants. Several ink drawings of designs for buildings by J. Pitt Bayley, architect, of Fulham-place, are exhibited for churches at Windermere, Brixton, Douglas Cathedral, Isle of Man, &c. A cottage hospital at Surbiton, and designs for church furniture are among the drawings. The churches are in different styles, and have apsidal ends with wood groining. A design for an improved iron girder by Edgar Pask, and drawings of internal decoration are other exhibits in this part. Electrical and lighting apparatus is represented. G. E. Webster's duplex system of gas-lighting, and the gas-fire which can be fitted in front of any grate, and which radiates heat into the room, are worth notice. The latter is a semi-circular shaped apparatus with fire-brick back, and with two layers of open wire netting in front, the gas heats to a red glow the inner netting, and the metal and firebrick retains the heat. W. J. B. Symes' gas-filter is a novel apparatus for purifying gas, and the difference of light shown in the working-model is certainly in its favour. The inventor claims a saving of 20 per cent. An automatic electric lamp is shown by A. J. Jarman. We notice among other mechanical improvements, an ingenious "ball castor" for furniture on the principle of the universal ball and socket, by which the weight of furniture is sustained centrally. D. Leah shows a clever means of connecting the tap and vent of beer-casks by a small flexible tube so as to allow free running of the beer, the opening or closing of the tap simultaneously opening or shutting off the air. A double kettle to increase heating-surface, for spirit or gas-stoves, is shown by this inventor, besides many useful improvements in naval and life-saving apparatus to which we cannot here refer. A folding screen by T. A. Bone, and a decorative design for a lamp-shade by C. M. Walker; improvements in pianoforte construction, conservatory-stove for gas, by G. E. Webster; an alarm till for shopkeepers, by H. Opperman; an improved railway-brake and carriage-door, the latter being made sliding, are objects which meet the visitor's attention. An instrument for describing ellipses, by E. Pask, engraver, is simple, and J. S. Johnson's rules, combining self-acting square and compass, are interesting improvements, and appear to answer their purposes well.

We pass on to notice a few of the more artistic works, and the first models of interest we see are some plaster models of an entrance to house in Throgmorton-avenue, by F. W. Porter, architect, lent by C. S.

Kelsey and Sons. The details are well designed in Italian; a doorhead also, with reclining figures in the spandrels, and carved tympanum, is spirited and clever. Metal-work is not very largely represented. W. J. Allard shows a pleasing allegorical design for a clock-dial in copper repoussé. Some repoussé work in iron, by G. H. Hardiman, and embossed dessert-plate, call for notice, not so much for artistic merits as for its execution. A pair of bronze and ormolu candlesticks with figures, and a pair of bronze, by W. H. Izod, are also shown. Wood-carving is represented by some very artistic and spirited panels in oak and pine, by W. Ammonier, whose work we have noticed favourably before. The chrysanthemum panel design in oak, and a festoon, are feelingly carved, and the panel or pilaster in Renaissance is clever and refined in execution; the relief being low but sharply cut. E. T. Grove also sends a walnut and satinwood cabinet and frame, and we notice a carved clock-case in oak by H. Wilcocks, and a dark oak clock-case on a bracket, by Jas. Barron, relieved by Elizabethan mouldings and carved work. The birds and nests by W. F. Jenkins (86) are a wonderful feat of manipulative skill, and the details and moss are rendered with a minuteness which will excite admiration in the visitors. G. H. Bull shows some good carved work in frames and brackets. There is little in the cabinetwork or inlaid specimens to which to draw attention this time. A Japanese hanging bracket, and a few boxes and cabinets are to be seen, but are not mentionable for any special merit in design. Painting on china is a branch of art few have availed themselves of. The best designs we see are two plaques with swallows by Arthur Evans, glass painter, and three terra-cotta plaques with heads and flowers by Jessie Hills. The last is creditable work for a student whose art-training has not been perfected. Edward Sears contributes stained-glass panels, and N. Sears an allegorical subject in glass representing Time.

Coming to the paintings and decorative subjects, our review need not occupy much time. The water-colour drawings, a very few of which are in this class of the exhibition, contain some clever sketches by S. James, chiefly of the North of London. Turner's Fields, Highgate, the Seven Ponds, Winchester Hall (recently pulled down), Highgate Hill, and the corner of Tottenham Court-road and Oxford-street show decisive handling; the buildings are well put in. Another sketch of coast scenery at Land's End, by T. E. Jeffers, and a septa drawing of Well Hall, near Eltham, by Alice B. Perry, are creditable. In the specimens of decorative work we notice some well-executed specimens of graining and marbling by H. J. Medhurst, three decorative panels by T. B. Parlyby, and hall and staircase decoration, by H. G. Wright. The predominant colour, light sage-green, is pleasing, but the design of the apple-blossom in the panels of dado is wanting in repose. On one table we see specimens of ornamental red brickwork, showing cut and rubbed work by a builder's foreman, terra-cotta heads, &c., all clever specimens of handiwork.

Our notice would not be complete were we to omit mention of the amateur part of the exhibition, which will be found in the upper rooms. The several branches include wood-carving and inlaid work, painting on porcelain, oil and water-colour paintings, pen-and-ink drawings, architectural and mechanical designs, needle-work, and models, and fancy articles of all descriptions.

In the wood-carving we glance at four carved oak cabinet doors with thistle and poppy foliage, several specimens of decorative pottery showing various degrees of artistic knowledge; oil-paintings, from smudges and eppies by tyros in the art, to decided indications of talent. The silver

medal goes to W. Hooper for "Summer Fruit," in which the execution shows skillful handling, though faulty perspective and shading; the "White Currants" by the same artist exhibits conscientious observation of nature. With regard to copies such as that of "Cherry Ripe," "The new and old Eddystone Lighthouses," we are sorry such daubs should have been placed where they are. One of the best studies in oil is J. S. Teape's "Spring Flowers" (245), primroses and wallflowers in a vase, and another figure subject is "Waiting for the Tide," by the same artist, a carver. Amusing attempts meet the eye in the water-colour collection, and it is a pity these were not placed elsewhere. They represent, however, a strong craving for art on the part of a number of amateurs whose real avocations are not at all associated with art. Thus there are tin-plate workers, pastrycooks, locksmiths, sign painters, estate agents, joiners, jewellers, letter-sorters, and even policemen among the contributors to the artistic exhibits. Pen-and-ink drawings are numerous; No 288, a humorous study of London and sea-side life, obtains a medal. Several abortions are hung, which almost make the collection ridiculous, such as 289, 262, 265, 266. No. 296 is one of the best ink sketches. The details of a queen-post roof, by G. E. Bulgin, is a more instructive kind of drawing, and it is a pity that so much energy is spent in copying bal and vicious objects under the impression that they are artistic. In the needlework good design and colour is shown in 333, a cushion in crochet, and several models, some of cathedrals and others of a more useful kind, are exhibited, which indicate the same desire to turn constructive capacity to account, but often in the least profitable manner. The work of pupils and apprentices under 18 is extremely instructive, and we discover here and there signs of latent genius and misapplied talent. As a piece of cabinetmaking, the ebonised cabinet and back, by an apprentice aged 17 (C. R. Hamblin), is creditable; and the clever and spirited panel carving, by W. H. Allen, another apprentice of the same age, calls for attention. O. R. Plummer's oak-carved chairs are cleverly executed for a youth; and the drawings of technical carpentry, by F. J. Bancroft, aged 16, are highly commendable for the industry and skill exhibited; but we have no space to enter into this department with the attention to details it deserves.

THE WATER QUESTION.—XVIII.

THE SIZE AND COST OF A RESERVOIR— (Continued.)

THE size of the reservoir here taken as an example from which to estimate approximately the cost per million cubic feet of storage room—and that is, perhaps, the most convenient form in which a general estimate can be attempted—is one which would be sufficient to equalise the flow of the streams from an area of 2,000 acres during three consecutive years of least rainfall in a locality where 33in. is the average annual rainfall of a long series of years; and where, also, the character of the rainfall and the ground are such that 180 would be the proper number of days' storage of the average daily yield of those three years; the site being understood to have the proportions already stated as being approximate to an average of many examples. In such a case the available depth of a year's rainfall would be 15in., if from 14in. to 16in. be allowed for evaporation and other forms of loss, and from 5in. to 6in. of the 33in. as being in excess of the average of the three years to be reckoned upon. The area from which the water would proceed being 2,000 acres, the yearly amount would be 94,350,000 cubic feet, and the daily average yield 258,575

cubic feet. To contain 180 days' supply, therefore, of this quantity, the capacity of the reservoir would be 46½ million cubic feet. This would be impounded by an embankment 600ft. long and 60ft. high at the middle of its length. If the top width be made 20ft., the inner slope 3 to 1 and the outer slope 2 to 1, the extreme width of the seat of the bank would be 320ft. nearly (rather less, because the level of the ground at the toe of the inner slope is somewhat higher than at the toe of the outer slope, and because the inner slope is flatter than the outer one); and the area to be cleared of objectionable material, to a depth of, say, 5in. vertically, would be about 12,000 sq. yd.

If the thickness of the puddle wall at the top be made 7ft., and the batter of the two sides 1 in 8, the width of the puddle trench at the lowest part of the ground would be 15ft. nearly, and 7ft. at the ends. The depth in different parts of the trench would vary according to the ground met with, but would be, in general, deepest near the middle, and if at the middle point the depth be assumed to be equal to the height of the bank—60ft. in the present example—and 10ft. at the ends of the bank, a line drawn straight between these lowest points would probably equalise the steps in which, practically, the bottom would be cut, and would represent the average depth. The excavation of the puddle trench would then be, if the sides were carried down vertically, about 8,000 c. yd. The quantity of puddle below the ground would be the same. Above the ground the puddle wall would be about 6,000 c. yd., and the total quantity of puddle 14,000 c. yd.

The embankment would be 80,000 c. yd., including the puddle wall, and deducting that the quantity would be 74,000 c. yd. The embankment, less the puddle wall, is taken in one, because, although the material consists of three kinds—viz., a toe of rough stone at the foot of each slope, selected material on each side of the puddle wall, and the remainder of earth, each of which would be estimated at its own price when it had been ascertained from what part of the site each kind of material would be procured, yet in a general estimate the distinction can hardly be made. There would be, however, in this example 8,000 c. yd. of rough stone, 24,000 c. yd. of selected material, and the remainder would be 42,000 c. yd.

If there are to be two discharges from the same reservoir—viz., one for supply and the other for compensation to the stream, the supply pipe would be laid through the discharge culvert, up to the valve tower at its inner end, whether it be situated in the reservoir, clear of the embankment, or be built within the embankment itself. The former is the better plan. The best position of the discharge-pipe or culvert, or the line along which it should be laid, demands the most serious consideration in every case, in order to hit the happy medium which combines security with economy. The level at which it must necessarily be laid being near the bottom of the reservoir, and the puddle trench being almost as necessarily sunk much below that level, the pipe or culvert, when laid near the middle of the bank, must cross the puddle trench at a considerable height above the bottom, and right through the mass of puddle. This is the plan which was formerly adopted, whether the discharge-pipe was inclosed in a culvert of masonry or was laid bare in the ground; but as it was necessary to support the pipe or culvert across the trench upon a more solid foundation than the puddle itself afforded, the unequal settlements which took place when the bank had been made to its full height tended to fracture the work.

To obviate this, straight vertical joints completely across the whole structure of the culvert were sometimes provided at the

points where the unequal settlements would be likely to occur—slip joints—so that the portion of the culvert on each side of the slip joints might settle bodily and evenly. In the same way the brickwork of railway and other tunnels driven through yielding ground is made with a straight joint at the end of every length, instead of leaving toothing for the next length, which is proper enough, and more slightly when finished, where the ground is

on unyielding rock. This provision of a straight joint, however, in the case of reservoir embankments, has sometimes not had the expected effect, owing to the uncertainty of the direction in which the settlements take place, there being horizontal as well as vertical movements of the earth above the culvert. The culvert, therefore, should not cross the puddle trench at any great height, if at all, above the bottom of

the trench. This consideration drives the position a long way from the middle of the bank, as is shown in Fig. 2 on preceding page, in order to lay the culvert in the solid ground.

The bottom of the reservoir, to a height of 11ft. or 15ft. above the lowest point, contains but little water—say in this case half a million cubic feet. It is not necessary, therefore, to lay the discharge-pipe lower than is sufficient to draw off the water to this level, say 10ft. below the top-water level, and the lowest sluice should be, say, 3ft. below this level, to give a head of entrance into the pipe, thus fixing the level of the upper end of the discharge-pipe at 13ft. below the top-water level of the reservoir, by which means 46,000,000 cubic feet of water can be drawn off from a full reservoir. If the invert of the culvert be laid 2ft. lower than the pipe, it would form a channel for the compensation water to be discharged into the stream. To determine the size of the culvert, that of the supply-pipe must first be found. The daily quantity of water due to 13in. rainfall on 2,000 acres of ground is, as before found, 258,570 cubic feet. If one third be discharged into the stream as compensation, the quantity passing through the pipe would be 172,380 cubic feet per day. If the mean daily velocity through the pipe be made 2ft. per second, the diameter found from these data would be 15in. In assigning room for the 15in. pipe, which would be laid before the arch of the culvert is turned over it, it should be considered that it might be possible at some future time that it would be necessary to cut out, remove, and replace one of the pipes, in which case more room would be required than is necessary for laying the pipe in the first instance; the width and height, therefore, should be sufficient for this—say 5ft. wide, and 5ft. high. The best form would be that shown in Fig. 1. The pipe would be supported above the bottom of the culvert, which might be by cast-iron girders built into the walls.

The width of the trench for the culvert would be about 10ft., and it should be made straight as far as it extends under the embankment, and some distance away from the foot of each slope, as shown from A to B in Fig. 2; but excavation may be saved towards the ends by inclining them inwards from the points A and B to C and D respectively.

In laying the culvert in the trench thus excavated in the solid ground at such a depth below the head of water, every possible care is to be taken to prevent the water finding a way outside it, and for this purpose gravel puddle is a suitable material with which to solidly fill every space not completely occupied by masonry. It may be thought that concrete is a more suitable material for this purpose, and in any case the invert of the culvert would be laid on a bed of concrete, unless the ground consist of a solid rock; but for filling in the spaces between the back of the masonry and the sides of the trench gravel puddle is a better material, inasmuch as it can be made more compact and watertight is such a situation. The valve tower at the upper end of the discharge culvert may be of brickwork 18in. thick, 6ft. diameter inside. The lowest valve being 4ft. below the top water-level; there might be three more above it, at 30ft., 20ft., and 10ft. below that level, so that the water can be drawn off from near the surface at all times. These would all communicate with the descending pipe erected within the valve-tower, from the top of which they would be worked, a light iron footbridge affording access from the top of the bank. 8 in. by 8 in. with the lowest valve would be sufficient for drawing off the compensation water. This should be of larger size than the supply-pipe; in this case it might be 2ft. diameter, if circular,

but a rectangular form is preferable. The inside slope of the embankment would be covered with rough stone, the interstices being filled with smaller broken stone, forming a protection to the earth from the wash of water. The area to be so covered would be about 6,000 sq. yd. The outer slope, to be soiled, would be about 4,000 sq. yd., and, including a grass border on each side of the road to be formed on the top of the embankment, the quantity would be 4,800 sq. yd.

A more important part of the work is the waste weir and byewash. For such a drainage area as that assumed the length should not be less than 60ft. The byewash may be nearly wholly of concrete, of the form shown in Figs. 3, 4, and 5 on previous page.

By forming the byewash in a series of ponds, of not more than 6ft. difference of level between them, the descent of the water, in the heaviest flood, may be sufficiently checked, and it may be gradually let down to the stream below the embankment without injury.

A large body of water may be dealt with safely if it be prevented acquiring a too great velocity. Each of the steps shown in the sketch forms an independent pond into which the water falls from a moderate height. The general inclination is, in the example, 1 in 8, each step 6ft., and the length from step to step nearly 48ft.

There would be, in a flood, a great body of water, but no great velocity in any part of the channel; and, except for the overfall sills, which should be of stone, the whole of the byewash may safely be formed of concrete. If the width at the level of each overfall sill be made 30ft., or half the length of the weir, when the water is flowing 2ft. deep over the weir the corresponding depth over the sills would be 3-17ft.

The land occupied by the whole reservoir would be, on the scale previously referred to, about 50 acres.

The estimate would stand thus:—

	Quantity.	Price.	
		s. d. £	
Clearing seat of embankment	12,000 sq. yd.	0 2 100	
Excavation of puddle trench	8,000 c. yd.	5 0 200	
Clay puddle	11,000 "	2 6 1750	
Embankment	74,000 "	1 6 5550	
Road over embankment	800 sq. yd.	2 0 80	
Pitching inner slope	6,000 "	2 6 600	
Soiling outer slope	4,800 "	0 2 40	
Excavation for culvert and valve-tower	4,500 c. yd.	4 0 900	
Putto for byewash	4,000 "	1 0 200	
Concrete in foundations	300 "	6 0 90	
Putto in byewash	2,200 "	7 0 770	
Brickwork in culvert and valve-tower	700 "	21 0 810	
Gravel puddle	500 "	4 0 180	
Stone sills, caps, coping, &c.	1,500 c. ft.	2 0 150	
Valves, &c.		150	
Footbridge		180	
Gauge well		100	
		£13,650	
Contingencies		1,400	
		15,000	
Land and fencing		5,000	
		£20,000	

This would be at the rate of £135 per million cubic feet of storage room, for works and land, but as, perhaps, there might be required as much as £2,000 for expenses outside these, the whole cost per million cubic feet would be £178.

MEDIEVAL SEALS AS WORKS OF ART.

(WITH LITHOGRAPHIC ILLUSTRATIONS.)

IT is remarkable at the present time, when works of ancient art are so highly valued, and everything relating to them is studied so diligently, that mediæval seals are comparatively neglected; for, though their importance has long been recognised by antiquaries, their art-value seems not to be sufficiently known. When it is considered what light they throw on the architecture, costumes, shipping, and every detail

of the external life, and even on the habits and manners of thought of the ages in which they were executed, it will be seen that they are not only an excellent guide to the history, but also an invaluable exponent of the art, of the mediæval period.

Their use was introduced into this country from France, perhaps with that affectation of Norman manners which preceded the invasion of the Conqueror. Those of the French kings begin with Dagobert I. in the seventh century; but, though there are seals of Offa and Renulf, kings of the Mercians, the Great Seals of England are first found in the time of the Confessor; and from that period they form an uninterrupted series to the present time. In shape they are round, and represent on the obverse the king mounted and in vigorous action, holding in his hand a sword or spear, and on the reverse or counter-seal seated on the throne. The early examples are rude in execution, and partake of the character of all archaic design; and in them the throne is little more than a simple stool; but in the time of Henry III. it received architectural additions in the way of pinnacles and arcading, which became more elaborate with each succeeding reign. At the same time the figure was better drawn, and the detail more developed, owing to the improved execution of the seal. In the reigns of Edward III. and his immediate successors the art was at its perfection, its productions being designed in that spirit of beauty with which the ready metal-workers of those days could endue the least objects of their care. Nor was any labour spared on their accessory decorations, which in the fourteenth century were lavish in the extreme. Having thus culminated with the Gothic style, the art of seal-engraving began in the following reigns to partake of the decadence which was foreshadowed in Perpendicular period; and the Pointed style was abandoned in the time of Henry VIII., when seals of Debased Renaissance character were used. But it was in the time of the Commonwealth, "in the third year of freedom by God's blessing restored," as we are told in the inscription that it was most degraded, for the great seal of this date displays on one side a *perspective* representation of the Commons assembled, and on the other a map of the British Isles.

It was in the twelfth century that seals were first ordinarily used by private persons and corporate bodies; but in the following one their use became general. It will be found that their art-history is precisely that of the royal seals. Amongst ecclesiastical ones those of prelates are perhaps the most interesting. Their shape is generally a pointed oval, and they usually represent the bishop giving the benediction. In the early examples the figure is in the simple and archaic spirit found in the great seals; but diapered backgrounds and canopies were soon added, medallions and shields of arms being often placed at the sides of the figure. The seal of Richard Aungerville, Bishop of Durham, author of the "Philobiblon," and a correspondent of Petrarch, 1333-1345 (Fig. 1), is the finest period of the seal-engravers' art; and the dignity and elegance of the pose and drapery of the figures, together with the richness and beauty of the architectural and other accessories, have, perhaps, rarely been equalled; yet, this elegance was a general characteristic of the period, and the seal of Ralph, Bishop of London (Fig. 2), is another excellent example. Sometimes the arrangement of episcopal seals was varied, the middle being occupied with figures of saints, while the bishop himself was placed in a niche beneath. The seals of monasteries and guilds form a large class of infinite variety. Some of them have elevations of churches or other ecclesiastical buildings, while many have representations of figures beneath canopies; but all con-

tain architectural details of the greatest interest. That of the Priory of Wenlock (Fig. 3) gives an admirable rendering of St. Michael destroying the Spirit of Evil.

Seals were largely used by private persons in the middle ages, for they were attached, not only to legal documents, but sometimes to private letters; and many of them have been preserved, some of considerable beauty. Those of the great barons, like the royal seals, generally represent the owner armed and mounted, as in the spirited one of Henry de Laci, Earl of Lincoln, *ob.* 1310 (Fig. 4), and are equally valuable for the details of armour and accoutrements which they furnish. That of Thomas de Beauchamp, Earl of Warwick, dated 1344, is an excellent specimen, in which the shield on the counter-seal is surrounded with beautiful Gothic tracery. The lesser nobles and knights ordinarily used their armorial bearings, sometimes in combination with most elaborate ornamentation, as in the seal of Lord Bardolf of Waringay, *circa* 1350 (Fig. 5), and the counter-seal of Mary de St. Paul, Countess of Pembroke, of about the same date (Fig. 6). It may be observed that in all seals of this date the heraldic animals are drawn in a fine spirit of grotesque, which modern herald-painters would do well to imitate. That of George Rygmayden (Fig. 7) is a singular example, which contains a rebus on the name of its owner, a maiden seated on the ridge of a hill. That spirit of quiet merriment, which was the cause of the quaint gurgoyles and *misereres* of our churches, is also observable in the seals of the middle classes, who, having no armorial bearings, were compelled to resort to grotesque and punning devices, and consequently the seals of the fourteenth and fifteenth centuries form a curious and interesting study.

The use as personal seals of antique gems with mediæval settings is a singular chapter in the history of glyptography. The means by which they reached this country are not known; but they certainly were highly valued, and were probably collected in Greece and Italy by crusaders and pilgrims on their return from the Holy Land. Most of those discovered are late Roman in date, few being of the best period of Classic art. Roger, Archbishop of York, 1154-1181, used a chimera with three heads; and Walter Gifford, also archbishop of the same see, 1226-1279, had Fortune holding a Victory, and also a medallion of two Romans. The seal of the Abbot of Walden was a winged victory, that of Ernaldus de Bosco, a warrior protecting a wounded man; and that of Eustace de Vesci, a galley sailing, with two dolphins. It is interesting to know that the mediæval workmen themselves essayed the art of cutting these intaglios, some having been found with Christian subjects.

From the seals of the admirals of England curious illustrations are gained of the singular ships of the middle ages, the precursors of our ironclad fleet. One of these is given in Fig. 8—that of Richard, Duke of Gloucester, afterwards Richard III., who was made Lord High Admiral when as yet only in his tenth year. Much information on these nautical matters is also found in the seals of some of the seaport towns, while those of inland towns, generally representing one of the gates or other fortifications of the city, give details of military architecture, which cannot be otherwise obtained. The seal of the City of Norwich (Fig. 9) is a good example.

Besides their intrinsic value as works of art, it will be seen, from this short account, of what use ancient seals may be made as suggestions for modern design; and it cannot be doubted that those who are interested in mediæval art may derive much advantage from their study. To the architect, especially, they are invaluable, for a small and carefully selected collection of impressions, occupying

but little space, places in his hands, at a trifling cost, the very works of the ancient masters. What, for instance, could be more suggestive of beautiful treatment than the elegant tabernacle work in Figs. 1 and 2, or the equally admirable tracery in Figs. 2 and 3? To the herald, too, and the student of furniture, costume, and kindred subjects, mediæval seals will be found a veritable mine of information.

In conclusion, it may be amiss to offer some remarks on the present state of the art. Its chief characteristics are poverty of style and flatness of execution, due to the use of the die-press for making impressions on paper, whereas formerly they were taken in wax. The object of this is to enable numbers of them to be placed in books, without the material increase in thickness which arose from casts in high relief. To obviate the difficulty a plan has been adopted in some places of having a conventional printed copy of the seal gummed in its place, the original matrix being placed upon it to fulfil the requirements of the law. In this case the seal itself is reserved for attesting important and distinct documents. It seems probable that the general adoption of this system, coupled with a diligent study of ancient examples, would free the art from its present unfavourable conditions, and lead to its complete regeneration.

JOHN LEYLAND.

ARCHITECTURE AT UNIVERSITY COLLEGE.

MR. T. ROGER SMITH, the newly-elected Professor of Architecture at University College, London, gave the following inaugural public lecture in that building on Tuesday evening, explanatory of the mode of teaching he proposes to adopt in the forthcoming session. The room was crowded, several being compelled to stand throughout the evening.

It seems to me fitting, said Professor Smith, that on this occasion, which forms the commencement of my duties as Professor of Architecture in this College, I should devote the opening lecture to an account of the course of instruction given in the architectural classes entrusted to me. In doing so I shall state what has hitherto been done, and what I propose to attempt, in my conduct of the classes, and I shall offer a few suggestions to students to show how they may best profit by the advantages which this college places within their reach; and I shall point out in what parts of their professional education the courses here given will assist them, and in what they must rely upon other opportunities. This has been announced as a public introductory lecture, in the hope that, at a time when the professional attainments of architects are about to become the subject of special examinations, what is here said may, perhaps, travel a little beyond the walls of this class-room, and so may help to draw public attention to the fact that University College has taken in the past, and is prepared to take in the future, her full share in the education of those who are intending to exercise the profession of architects. Before passing on to the consideration of the work to be done in the future, the past history of these classes, and the names associated with them, claim our attention. You probably all know that this is not a course of instruction now to be begun, but one which has been carried on for many years, and round which not a few associations have been gathered. No small part of my responsibility to-day is due to the distinguished bearing, ability, and success of the professors whom I have the honour to succeed in this chair.

Professor Donaldson, happily still living to enjoy an honoured retirement, is the father of the profession of architects in England. As the founder of the Institute, and in a hundred other ways, he has conferred benefits of the greatest importance upon architects as a body. As the first Professor of Architecture in this College, he has been most helpful to very many living architects of eminence, who have studied under him here. I had myself the great advantage of attending Professor Donaldson's lectures as a

student, and I am glad to take this opportunity of saying how largely I feel indebted to him. The vast stores of his learning were poured out before his classes ungrudgingly. The kindness of his manner made us all feel at home with him; and the unfeigned interest which he took in our progress was the very thing to rouse and stimulate our own love of our work. We all know something of the researches in Greece, and the studies in Italy, which will identify the name of Donaldson with the pursuit of Classic architecture as long as the literature of that architecture continues to exist, and, partly on that account, but far more in consequence of his personal qualities, Professor Donaldson was respected, beloved, and valued by us all, as no man ever can be whose attainments and whose character are not both of the highest kind. He established a comprehensive course of instruction in the art and in the science of architecture, and what he so started remains in the main the rule of study here to this day. I should not like to pass without mention the vast labour undergone by him in providing diagrams to illustrate his lectures, and the high artistic merit of the greater part of those diagrams. As specimens of architectural drawing and tinting, those sheets (the chief of them being the work of his own hands) were calculated to exercise the best possible influence on the students. They placed before us good examples drawn in a singularly artistic manner. Nor did the Professor's services to his pupils stop at placing illustrations before us. With rare liberality he put them into our very hands, lending them to us for private study at our own homes. There is much more which I should like to say were this the proper occasion, but I will only add (what is, perhaps, the highest tribute that I can offer) that there were few of the students in Donaldson's classes who did not at the close of the session feel that they had not only attended a learned Professor, but had made a valued friend.

When Professor Donaldson retired, his duties devolved upon my immediate predecessor, Professor Hayter Lewis. I cannot speak of his work from the same standpoint which my memory of student days affords me in regard to Professor Donaldson; yet, having had the honour to be long associated with him in work elsewhere, and more recently to act as his substitute here, I feel that I am, perhaps, as competent as any one not his pupil can possibly be to appreciate at their true value Prof. Hayter Lewis's services in this chair. Public-spirited, like his predecessor, Professor Hayter Lewis has been a signal benefactor to the body of architects at large; and the establishment of voluntary examinations open to students of architecture was only one, though probably the most important, of the measures which he has been instrumental in forwarding. In this college he has laboured assiduously and with signal success, bringing to the work a wide store of learning, a singularly accurate, orderly, well-regulated method of procedure, and the attainments of a highly-cultured artist, student, scholar, and traveller. He has largely added to the already ample series of illustrations which, by the kindness of Professor Donaldson, have been allowed to be used, and he has most liberally permitted his drawings also to remain here for your benefit. It is a matter for sincere regret that Professor Lewis should have felt it necessary to retire from a post the duties of which, had his health permitted, he might have discharged for many years with the greatest possible advantage to students of architecture and to this college.

I cannot but feel how serious is the responsibility cast upon me in succeeding to men of such powers and such attainments, and I can only say that I will do my very best to keep near the high standard reached hitherto in the work of these classes. I should be the first to admit that I am in many respects unequal to my predecessors: yet I ought fairly to add that unless I had felt that I could in some degree do justice to the post I would not have sought it or accepted it. As far as I know my own powers and attainments, I will so shape the course of study here that students shall have the best which it is in my power to give, and so far as I feel my own proper line to differ from that natural to those who have gone before me, to that extent and no further, do I propose to modify the method or system of teaching which I shall pursue. As to the subject-matter of the

lectures, that in the main must continue what it was under my predecessors; but with the addition, as a permanent branch of the subject, of the course of lectures on Professional Practice, which, with the concurrence of Professor Lewis, I introduced as an experiment two sessions ago; for the attendance upon these has fully justified my belief that the subject was one on which lessons would be felt to be acceptable.

The classes, I need hardly say, are intended especially for young men who are being educated for the profession of architects, and they have been and will be carried on with a view to being made as useful as possible to students of this description. The courses, in whole or in part, have, however, been found useful by persons who are preparing for or following kindred pursuits, as civil engineers, surveyors, builders, and others. The classes are in no case intended to supersede the training obtained by being articulated or apprenticed, but they will aid the pupil, partly by enabling him to make a better use than he otherwise could of the opportunities presented to him by his pupilage, and partly by giving him information and rousing in him trains of thought which would not easily reach him in the routine of an architect's office.

It appears to me very unlikely that pupilage will ever cease to be desirable. I once, I confess, thought differently, and imagined that some well-arranged system of class teaching might in time come to supersede it; but I am becoming convinced that nothing but practice can well teach so very practical an art as that of the architect. But even in the offices which afford the most favourable opportunities, the pupil will be unable to learn all that he ought to acquire; and this deficiency must in some way be made up, or the young architect will be but inadequately equipped for his work. It is here that classes such as those which open this week come in most advantageously. They provide instruction such as the office in no instance can furnish. It is, moreover, not only the subjects taught, but the manner of teaching, which renders a class a valuable auxiliary, especially to a beginner. This consideration is too often overlooked, but it is one well worth attention. The instruction given in class is of the same kind as that to which the young student has been indebted for almost all that he has learned in school or college. He is used to it, and he knows, or ought to know, how to learn from it.

When a young man passes from a condition of life in which all his subjects of study have been taught him by qualified and appointed instructors, in which his time has been divided up for him into definite lectures, and in which his work is daily examined and his progress tested, and takes up the position of junior in an office, who has to learn what he can, as best he may, from such share of the office work as his superior is able to trust to his hands, the change is a great wrench. To some natures, of course, the altered circumstances act as a stimulus, and the new pupil begins rapidly to acquire knowledge; but this does not always— or, in my opinion, often—occur. It is seldom, I fear, the case that much good is done till some months more or less have been spent; and unhappily it sometimes occurs that the youth does not find his feet for years, if at all, and that invaluable time is lost. If for no other reason, it would be worth while for pupils to attend some kind of class, so as to keep up the old habit of study; and when a very arduous profession, requiring a great deal of technical information, has to be mastered, it is better that such class should be one which will contribute towards this end if possible, than one not bearing immediately upon professional training.

To put the matter shortly, the pupil best sees and learns practice in the office where he is articulated. He will best learn the principles which underlie that practice in some such college as this.

But it may be felt and urged that there are other ways of supplementing the practical training acquired in the office; and that it is not necessary to attend classes in order to acquire theoretical and historical information about architecture. Construction is no new science; architecture is not an art of modern creation, and many excellent standard books are accessible. The money payable as college fees would go far to procure a fair library of works of reference, and the time spent over the class would suffice

to master the contents of the volumes. I do not deny that this is so, and that the student able and willing to read, especially if he can read French, German, and Italian with facility, has access to the instruction of teachers far more profound in their knowledge of their various subjects than I can ever hope to become; and yet there can be little doubt that, especially in London, with its many amusements and many claims upon time, there is a poor chance of that steady, regular attention being given to a course of reading which is required to render it thoroughly useful. Many students, especially in the country, have only the resource of reading to supplement their office work, and well it is for them that books, and good ones, are accessible; but I have no kind of hesitation in saying that a year's attendance at classes will fix in the mind far more information than a year's reading. There is an impressiveness about the living voice which is wanting to print and paper; there is a stimulus in the presence and rivalry of classmates; the regular recurrence of the lecture evenings is of great advantage in securing that some time each week shall be devoted to study; there is, in short, at a college more inducement to close attention and careful note-taking than under the ordinary circumstances of study from books without an instructor; and the illustrations which the liberality of the past Professors have placed at your disposal, and those which I may be able to furnish, together with the specimens of materials, are of more value than most book illustrations. To those who are fairly able to attend I can, therefore, honestly recommend the direct personal teaching given in this classroom and at King's College, and the combination of teaching and mutual instruction so successfully carried on by the members of the Architectural Association, as calculated to aid their progress very materially.

In many classes in this and every other college, the subjects of instruction are chosen and arranged so as to prepare the student for passing a certain examination. The subjects for the first B.A. and the second B.A., and the B.Sc. examinations, are provided for, and the examination alluded to in various parts of the college programmes. This college, it is true, is not an establishment intended for preparing young men for examinations; but it must not be forgotten that both the examinations and the programmes of the classes have been carefully arranged to provide what experience seems to point out as necessary to a thorough education, special or general. More than this, there are now so many walks in life to which the passing an examination of some sort, or a whole series of them, forms the entrance, that it would be wrong were the subjects taught in the classes here not to a large extent made to correspond with the subjects required for examinations.

For the first time we now have an examination established which every architect who intends to take a position, such as membership of the Institute confers, must pass; and though I do not wish these classes to be considered as being henceforth devoted solely, or even chiefly, to preparing pupils for that examination, as conducted by the Institute of Architects, it would be idle to ignore what has taken place, the more so that I myself have given up a large amount of time and trouble to the organisation of the examination, and through many years past to the promotion of the voluntary examination which preceded it.

I shall have shortly an opportunity of discussing the subject in a paper to be read before the Architectural Association, so I will not enlarge upon it here. I must, however, point out that the programme of the examination issued by the Institute may be taken as embodying the minimum of attainment and skill which, in the opinion of the council of that body, and of a large committee of men of experience who advised the council, should be possessed by every architect at the outset of his professional career. It will consequently, I think, be useful to examine this programme, and to point out how much of its requirements can be supplied by information to be learned here, and how much is left to be obtained from the practical education which you must gain in the office, on the scaffold, from your sketching-tours, and in your own studies. The obligatory preliminary work consists of a set of plans with a perspective drawing, a sheet of details, and an ornament. This is, of course, intended to elicit practical skill in architecture generally and in

handling drawing materials and making drawings. That skill must, of course, be gained elsewhere, but I hope that the work would be indirectly benefited by what is learned here. Work done as a student, such, for example, as sketches from the diagrams, notes, or essays, may be also submitted, at the option of a candidate. The first subject for examination is the history of architecture, taking a general view of a wide field, and an examination in some detail of a single division of the subject. Our Art course of lectures here supplies the information needed for this paper, and arrangements (which I shall explain presently) will be made in order to enable the students to bestow special attention to one special subject each year, so as to correspond more exactly with the course of examination. The second subject of examination is one intended to show that the student has mastered some one style sufficiently to give him a command over its forms and features, so that he could use it on a building without committing gross errors. This subject is largely a test of practice and drawing and private study, but the classes will materially assist the student in his preparation for this paper, especially if he select the special subject of study alluded to above. The third subject is materials, construction, and sanitary science; and our Construction course covers the whole of these subjects as indicated in the Institute programme. I need hardly add, I hope, that practical as well as theoretical acquaintance with these subjects will be necessary in order to satisfy practical examiners, and must be sought on the works to which the student has access. The fourth subject of examination is Planning; and here practice will be of more use than teaching. I do, however, propose to deal with planning, as far as it can be usefully considered in the classroom, in my Professional Practice course.

The fifth subject—specifications and estimates—is one which is constantly kept in view in the Construction course, but on which direct instruction is given in the practice course. Here, again, practice elsewhere must be relied on to supplement the class-room work. Lastly, professional practice to a limited extent forms the sixth and last subject of the programme. This is fully dealt with in the course devoted to the subject. From this hasty view it will be seen that as much as the class-room can contribute to the student's preparation for passing this examination will be provided in our course of study here.

Another examination, that to be passed by candidates for the post of district surveyor, has recently been remodelled and rendered more searching than before. Here, again, practice and theory will both be tested; but most of the subjects which are likely to be touched upon form part of our Construction course, in which materials, construction, and ruinous structures are all dealt with, and of our practice course, which includes lectures on the Building Act.

I need only, I think, add that the examinations at the close of these courses, with possibly some intermediate examination, will afford the students a means of estimating their chances of success in these more important examinations, and good practice in answering questions on these subjects.

(To be continued.)

MODES IN WHICH RELIGIOUS LIFE MAY BE INFLUENCED BY PAINTING AND SCULPTURE.*

LIKE many other things, Fine Art is a power for good and evil, and its attractiveness makes that power great. For evil, we find it in works of vanity and vice; for good, we see it in the fire which shines from beneath the surface of good men's work. Will and genius are the sources of its power, and thus a work of marble or of colours becomes a thing of purpose and of life; yes, and a more true and clear exponent than language of men's nature and men's thoughts, for language may hide and pervert truth, but Art would convict itself in the lie it would try to tell. The impulse of art comes the artist knows not whence. An irresistible and untraceable ideal haunts him; its imagery falls

* Paper read by Mr. T. GAMBIER PARRY before the Church Congress on Oct. 6, in continuation of the paper read by Mr. G. F. BODLEY, and reported by us last week.

on him like a reflection from another state of being; the mystery of it engages him; the beauty of it fascinates him; its power increases in his search to realise it; heart and mind are oppressed at the sense of it; and the poetry of art alone affords the means of its expression. A work of art comes forth because it must. Its purpose is its own relief. All fine arts have a common origin, and are necessary to each other. The arts of the painter and the sculptor belong to the architect, and enhance the beauty of his work; but music does so even more perfectly; for, with all that sculpture may adorn it or painting enrich it, architecture is never so grandly beautiful as when the divine strains of music are echoing from its forms. Music translates those forms into a perfect eloquence, and clothes them with the colours of her own beauty. How easy then, to understand the endearment of art to mankind! Thoughts pure and beautiful flash across him, and are the next instant gone, like a sun-ray in the sky or a fragrance from the earth. The thoughts had left but a vague shadow of their image, but art rescued it and made it a reality. That first rude sculptor may well have started back who first saw the embodiment of his soul's conception. Whence that conception? An invisible, inscrutable breath had impinged upon his thoughts as the light air wafts across his forehead; whence it came and whither it went he knew not. There it stands before him a reality—terrible in its reality; an embodied shadow; an emanation from his own life; a film of thought that had flashed out from the unknown, and was the next moment lost; gone like the gloss upon the dew, but caught up, recovered, reproduced by his rude skill. How inevitable was idolatry! Whence was the birth of that rude image? Was it an agony of grief, or the dread of death, or of conscience that had struck up in his imagination? He looked blindly into infinity, conscious of a light he could not see. The terror of the unseen had forced upon him the idea of Deity. He felt the divine element in things and called them Gods. As with that rude sculptor, so in all time, art is both the creature and the producer of emotion; and most natural, therefore, is the result that the subject which produces the deepest emotions produces also the greatest art. Its moral and religious influence is indubitable; but unlike the effects of eloquence in literature and speech, art is most powerful by its indirect appeals. I doubt the moral value of its direct representations of pain or shame or evil. Its influence for good and noble action is by the fascination of its works which make those actions beautiful. Its illustrations of agony and vice are themselves as repulsive as the evil they wish to cure. I doubt therefore Hogarth's pictures of the Rake's Progress having ever stepped the course of a rake, or Morland's illustrations of the fall and ruin of Letitia having ever stayed the folly of a frivolous girl. But there can be no doubt of the power of art to elench a conviction already received, or to add force equally to superstition and to truth. The arts of all time have illustrated this, from the idol of the savage (the embodiment of the demon of his dread), to all that the arts of Assyria and Egypt, Greece and Rome, have done, or the lavished ornament of the Temple of the Jews, the paintings of the Catacombs, the frescoes of the middle ages; all testify to this use and power. The embodiment of the religious ideal—and deeper far than that, the impersonation of that ideal—has been a longing desire of mankind approaching to a necessity. The irresistible conviction of spiritual existence, the idea of the power and beauty of invisible beings, has so possessed the minds and imaginations of men that the whole material universe has been peopled with them, from the gods who reigned in the starry heavens to those bright and graceful beings with which mythology has filled the woods and fountains, the rocks, the ocean, and the very air itself. Impersonation was the ideal on which the Pagan arts had been perfected. They swayed the emotions of men. But yet with all their beauty, and with all their power, an impenetrable shadow hung over them. Satisfaction was incomplete. The impersonation was inanimate. The life of it, indeed, was in the artist's mind, and its beauty was in the eyes of those who looked on it. Human sense had grasped at what the human spirit had yearned to see. The material of an inanimate symbol was given to it. Intellect and sense alone were satisfied. The heart, the main-

spring of humanity, was not touched. A great ideal in philanthropy, in literature, and in art had for ages occupied the mind and imagination of mankind. But whence its power, if it were but a thing of fancy or a dream? The whole fabric of it had long since perished but for the conviction of its own inward truth. That conviction was the forecast of a great reality. All art had strained its eyes towards it; the loftiest music of all poetry had raised its voice to it; and, far beyond the reach of all these, suffering humanity had lifted its blind eyes, and stretched out its hands to it; and it was this—the hearts of all nations had yearned for the impersonation of life. At length, and in the fulness of time, that life was manifested, and that Life was the light of men, and the human heart was satisfied. The Christian artist is like "the sower that went forth to sow." Art is truly a divine seed, whose fruit is for the sweetness of man's life. But human infirmity mars it, and human failing blights it; till, well watered by human tears, men reap in joy. Art is sent with a divine message to the world, and that message is the evidence of the universe to the perfection of its Creator as exhibited in the mystery of beauty. This is the commission that the artist bears—to translate to the world the symbols of God's universal love. The divine attributes of power and infinity might overwhelm the world with fear, but the attribute of love reassures it. Beauty is the symbol of that love. Reason cannot define nor imagination fathom it; and he that bears the commission of that message can do no more than, by the simple eloquence of truth, to win the sympathies of men, and to train them as he has trained himself to see in the lineaments of beauty not the mere fancy of a fascinated sense, but a power overlying, underlying, pervading all things—the mystery of beauty; not a mere quality of material, but an element of life; not a mere accident in physical nature, but a designed purpose of its existence. But here we are met by the Word of Wisdom which must be true, that "no man by searching can find out God." To answer or to explain this impediment we need but little of our own unaided wisdom to reply that "the philosopher cannot be found out by searching among the atoms of his body, nor the life or instinct of an animal by the keenest anatomy." An unwise man does not well consider this, and a fool will not understand it. But the Word of Wisdom is perfect, and has dispelled all difficulty and discouragement by answering thus:—"The spirit searches the deep things of God;" and it further adds "we have received the spirit which is of God that we might know the things that are freely given to us of God, because they are spiritually discerned." Great powers of insight have been given to us, but they fail to reach that spiritual ideal, except on fixed conditions. The senses, reason, imagination, conscience, are the main elements of human perception; but each one is subject to those conditions. No one function of that great machinery can arrogate its own sufficiency when its gaze is turned to things divine. Imagination is indeed that faculty by which the soul ascends to the contemplation of the Divine nature, but for its health it needs the balance of the rest. So sense and reason alone must fail to reach it. They may suffice to treat of the phenomena of mind and matter; but they make a sorry and a crippled machine to trace the course and conduct of human life. The cold and narrow creed that some schools of thought and philosophy would thrust upon the world exacts a far more difficult acceptance than the wide and simple Gospel of God. The immortal soul is self-conscious. It is conscious too of universal life, and of its own place in it. It has been offered that Gospel of Death, and has refused it. It is satisfied with the knowledge of the fact of mystery, as that without which Eternity would be an idle void. It listens to the echoes of a distant Past. It has never let go the hand of God. It sees and hears His guiding spirit in the trial-sphere of human life. It knows His footsteps; it traces His life. All Nature is His parable. But Nature is the universe, a wide subject, and a large word to use. Nature has many meanings to men's minds. Nature is God's home and ours. How lovely is she! And yet men wrangle over her. Pride and faith would fight over her; but, thank God, how near does the love of her bring together the Philosopher, the Christian, and the Poet, heal all the wounds of prejudice and mis-

trust, turn all their enmity and contempt to brotherhood, and bend their rivalry in her adoring admiration! All subjects take their colour from men's minds. Things present themselves, and men's mind re-present them. But then those things have passed through a great machine, through the sieve of an instant analysing sense, through stream and counter-stream of reason and imagination, and they come out, like the hope of the human soul, unchanged indeed in individuality, but transformed, transfigured. So the influence of fine art upon thought and life depends greatly upon the tenor of individual disposition; for some minds turn all poetry into prose, and some invest the simplest things with the halo of their own brightness. *Nihil tetigit quod non ornavit.* The spirit of universal life in nature points to immortality. Fine art embodies it, and translates its lovely parables to the world. She is the bearer of the lamp of that life to all who have eyes to see the divine beauty in her imagery and ears to hear the divine wisdom in her voice. But some are cold, some deaf and blind; and she casts her pearls before them in vain; for no art can draw music from the chord that Nature has not already tuned. If science and morality have their sermons in stones, religion has hers in forms of beauty. But, alas! it is not unreasonable to fear that the influence of fine art with the multitude goes no deeper than the eyes, and their value of it is rather for its furniture than its poetry. Regard plainly for one moment the effect of a great picture and sculpture gallery upon the multitude. What do they find? A vast array of pictures and statues; portraits and landscapes of all nationalities; here and there a scenic representation of a religious subject from one school, or an academic composition from another; then, more rarely indeed, a gem of devotional expression; the rest are boats, or battles, or domestic scenes most picturesque, or vice and revelry most offensive; and the sight-seers disperse, delighted with their entertainment, exhilarated by its brightness and confounded by its multiplicity. But pause one moment more. There were some who went lingering away; for there were these among that multitude, and possibly among the poorest and the meanest in the world's esteem, men, women, and perhaps children too, on whom some lovely ray of thought had struck; and the aspirations of devotional expression, still breathing from the surface of some old canvas, as the poor artist had left them, with his last sigh, a legacy for the world, had found their kindred spirit and had struck home at last. These were they who possessed the chord that Nature had already tuned. The music was in the lyre, and mute only till the musician's touch awakened it. But you have asked a serious question: "How can religious life and thought be affected by art?" I can only venture to reply thus:—Fine Art is profoundly more a thing of spirit than of sense. To a soul penetrated with the love of God all things minister. To such an one, whether practically an artist or not, but at least contemplatively one, whose powers of natural insight have been cultivated and refined by all that it is art's sacred mission to teach—to such a one Nature has opened wide her great treasury of Divine life. She has spread before the eyes of his responsive spirit, in a vista of infinity, the mystery of Divine beauty. Unsolved, unsolvable! He gazes with adoration. The highest faculties of his nature—of body, soul, and spirit—in silence bow before it. Sense perceives, imagination portrays, reason accepts, conscience assures, with all the power of their blended testimony, that that inscrutable mystery of Beauty is the mode in which it has pleased the blessed God to communicate to His creatures the perfection of His wisdom and His love. The sublime vision is beyond the range of mortal sight. The moral sense, the voice of the soul within, has answered "Yes;" and the heart turns to its course in human life, the sphere of a short pilgrimage, fortified and content. The convictions which thought, study, and the experience of life had heaped together, stored, sorted, and purified in the great laboratory of memory, have been illuminated by a ray from the throne of immortality. Fear vanishes. Difficulties which tempt, infirmities which impede, are but the discipline of an existence conscious of its own infancy. The way of life lies out before. The light of Divine beauty has been shed upon it; and thus along the pathway of this mortal life, whether it be earthward or heavenward, the footsteps of

the travellers are made light, and their hearts rejoiced with the blessings of assurance and of peace.

In the discussion which followed, Mr. Beresford Hope, M.P., said: The question that is proposed to us is the mode in which religious thought and life are influenced by architecture. It would be an equally valuable and equally interesting inquiry to investigate the mode in which architecture may be influenced by religious life and thought. Let us combine the two investigations together in one great inquiry into the theory of architecture as an offshoot and exponent of religious life and thought. The propensity and passion for, and the necessity for, building, is one of the most salient marks of civilisation. Civilised man is above all things a building creature. Civilisation is universally building for decency, for comfort, for convenience, and for beauty. Egypt and Nineveh are my witness; Greece and Rome, mediæval and modern Europe, all testify to the fact that wherever the truth and wherever civilisation has freshened the nations we have beautiful buildings. Every noble nation and every patriotic commonwealth, by the very rule of its existence, must build. Then I declare emphatically that the most elect of nations, the most august and most universal of commonwealths, the Christian Church, must above all others build, nobly, reverently, lavishly, piously. It must build, or it will not be the Christian Church—*ecclesia Dei*, the civiliser and consoler of souls. The little fragments broken off, infinitesimal chips of religiosity, may despise beauty and scoff at order; but the King's daughter, the true Spouse, has been from the first, and shall be to the end, all glorious within, in her clothing of wrought gold. Every spire, climbing up to heaven, like those of Grantham and Newark, and your own beautiful needle here at Newcastle, every church tower massive and four-square, watching over the miseries, the crimes, and weaknesses of human existence, like the triple group at Durham—every one is a perpetual litany rising with the incense of perpetual prayer to the throne of grace. I pass over the teachings of the elder Church. I say nothing of that most lovely temporary cathedral reared by Moses in the wilderness. I say nothing of that metropolitan temple planted by Solomon on Mount Moriah, like Durham domineering from its rock. I go to the Christian Church, and I call upon you to admire and to wonder at the exceeding wisdom with which, in the emergency of its first emancipation, having to provide for a settled, a prosperous existence, it took hold to the heathen tribunal, and out of that heathen tribunal, by a few changes, a few master-strokes of genius, converted it into the congruous temple of the Most High. The semicircular apse at the end, once the Prætor's seat, now held the Bishop's chair, his attendant presbyters ranged right and left. Over their heads in the curved vault, wrought in imperishable mosaic, the colossal figure of Christ, prefiguring the Apocalyptic vision—"The throne, which was set in heaven," and He Who sat upon that throne, and "round the throne" the "four and twenty seats," while upon the polished pavement beneath, recalling "the sea of glass like unto crystal," was the earthly presentment of "the golden altar which was before the throne." Lower down in their enclosure were congregated the white-robed singers, from whom, like "the voice of many angels round about the throne," arose the ever-recurring psalmody. Still further from the throne were thronged the great body of worshippers, representatives of "every creature which is in the heaven and on the earth and under the earth, and such as are in the sea," all ascribing, at the great Eucharistic rite, "blessing and honour and glory and power unto Him that sitteth upon the throne and unto the Lamb for ever and ever." Last of all, hovering round the door, stood the mournful group of penitents. Such was the material church of earlier days. As time went on more beautiful forms of architectural art developed themselves. The oblong pile, recalling in its form the ship—the ship that carried Christ, expanded right and left, and still continuing the ship became also the Cross. Then, too, the Bishop left his central seat for a more modest one at the side of the choir. In capital and in string-course, and on wall space everywhere, the living stone blossomed into forms of exquisite symbolical beauty. The wood-carver vied with

the worker in metal, and every window glowed with rainbow brilliancy. I am, of course, calling upon you to make your church peculiarly magnificent and spacious, for in all things it is well to hold up the highest model. The material church is the type of the spiritual Church. The congregation, too, of the Church is not a "fortuitous concourse of atoms." It is a Christian people duly assembled. In God's service everyone, from the clergyman to the smallest school-child scrambling up to the seat with its poor little legs hanging down—from the clergyman to the youngest child of the congregation—all are partners together in one common work, swelling the great chord of praise, carrying out our Lord's teaching that when two or three are gathered—and if two or three, then still more when two or three thousand are gathered together—their prayers, if uttered with a devout heart and in a believing spirit, will surely be heard at the throne which is set in heaven. I will not pass from my subject without a word of practical application. I am at this time standing in the ancient and famous borough of Newcastle, and I trust I shall be one of the last strangers to stand in that borough, and that those who come after me will be the guests of and the visitors to the city of Newcastle. You have heard this day how very near at hand is the accomplishment of the prayers and hopes of the good people of this place and of the Church of England and of your noble-hearted Bishop. But when you have endowed the bishopric, will you have completed your work? No; your next duty will be to give to the Bishop of Newcastle competent helpers, faithful counsellors, and wise executors in his cathedral Chapter, and even when you have done this you cannot sit down and stroke your chin in a fit of complacent idleness. It is true that in the parish-church of St. Nicholas you have a stately and noble building, of dimensions which entitle it, as you have got it, to be accepted as a cathedral. You have with much munificence and taste restored it, so as to make it in its arrangements a worthy parish-church. But it wants several things to fit it for its higher destination and to entitle it to take rank as a worthy cathedral. A reredos, delicate and aspiring as that of Durham, will be required; the throne of the Bishop must not be forgotten; the choir screen and parclose must be provided; a stately pulpit must be forthcoming. Above all, you must observe how wide are the spaces of plain wall inside, now happily relieved from the pollution of whitewash. These plain wall spaces are given to you to become the field for examples of the highest religious art. I do not recommend you to cover them with frescoes, for frescoes will soon perish under the air of Newcastle, so charged with chemical elements. But they offer themselves for that most enduring, most effective process of religious art, the glass mosaic, with its brilliant, well-contrasted colours standing out from the golden background; mosaics such as you find in the churches of Ravenna, of Rome, and of the Eternal Wisdom at Constantinople. If all which I suggest be done, the church of St. Nicholas, in spite of its moderate size for its new destination, may become a most beautiful, glorious, and remarkable cathedral, and one of which the citizens of Newcastle may well be proud.

THE SOCIAL SCIENCE CONGRESS.

THE Social Science Congress concluded its Dublin meeting last Saturday.

At 10 o'clock the Art Section met to hear an address on Art from its president, Viscount Powerscourt, K.P. Lord O'Hagan occupied the chair.

Lord Powerscourt, after a modest appeal for indulgence for shortcomings, reviewed the history of art progress in the different countries in Europe, especially dwelling on the encouragement given by the authorities in France to artists. In France, whether there is a monarchy, an empire, or a republic, there is the Ministry of the Arts, and the united wisdom of the council choose, independently of any consideration except merit, the works to which they award the palm in the annual exhibition. Most of the artists of importance in France have a school of pupils. A person wishing to become a pupil is recommended to the artist, and has to pay a deposit to him, after which he is formally admitted into his class, which is constantly visited and supervised

by the master. The Government send round annually to the different *ateliers* to know if there are any pupils of sufficient promise to complete for the Prix de Rome, which is an annual grant to pay the expenses of two pupils to go to Rome and live there for a year for study, and a portion of the grant goes to the master of a successful pupil, which is a direct encouragement to him to push his pupils on. Comparing the Salon with our Academies, one could not help seeing that the conceptions of British artists are very much limited in size, scope, and subject, whereas in France there is scarcely any limit at all in any direction. Of course, he did not mean to say that there are not as great artists in England or elsewhere as in France, but the opportunities of advancement given by the State are of a larger and more practical kind than those given by the Governments of other countries. He gave a short notice of contemporary art at home. It was singular to observe, in the works of even great men of some generations back in the British school of painting, how little attention comparatively appears to have been then paid to drawing. In the works of some even whose names are the greatest, not excepting Sir Joshua Reynolds himself, the human figure is often very defective. In some of Collins's beautiful landscapes the animals and figures are put in with a disregard of form, and sometimes even of proportion, which shows that detail was very much sacrificed to general effect. Turner's figures also often lack correctness; but, of course, nobody cares for that in comparison with the unrivalled aerial effect and beautiful tone of his works. But, except with regard to the paintings of the highest rank, the first thing that strikes one always in an exhibition in these islands is a certain garishness and crudity of colour, or rather a want of tone in the general scheme of colour. He felt very strongly that the foreign schools excel us in that point of tone very much indeed. There is no doubt that in the academies and in the Science and Art Department the curriculum of drawing from the round and from the living model exists; but either there is a want of knowledge, particularly of harmony of colour, or there is not sufficient discipline, probably from the want of any direct pecuniary advantage to the master, such as he had endeavoured to show is the case in France, where the first-rate artist is the general instructor, and gains a distinct personal advantage from the proficiency of the pupils in his *atelier*. After all, even in art, we must look to the fact, that, if a thing does not pay, it will not be well done; and he was afraid it must be said that the general standard, both in drawing and colour, is higher in the French school than in our own. The remedy was to have some kind of general supervision over the student's work by the first artists of the day.

THE ROYAL DUBLIN SOCIETY—TAYLOR ART SCHOLARSHIPS AND PRIZES.

THE trustees and judges appointed to carry out the trusts of the will of the late Capt. Geo. Archibald Taylor for the promotion of art in Ireland, have published the following conditions upon which £110 will be awarded in 1882 for one scholarship and two prizes. The scheme, as settled by the Court of Chancery in Ireland, provides that all students of art, not exceeding 25 years of age, "who shall have attended for twelve months a school of art in Ireland, or who, being of Irish birth, shall have attended for the like period a school of art in Great Britain or elsewhere, and who shall produce at the exhibition hereinafter mentioned a work of art displaying sufficient merit or a fair promise of future excellence," are qualified to compete. In case a scholarship is awarded to any student for a period of more than one year, the successful competitors shall, if required, in each succeeding year while the scholarship is held, satisfy the trustees and the Royal Dublin Society that he or she is continuing the study of art. The arrangements for the funds next year propose a sum of £110 to be applied to the formation of a scholarship of the value of £50, open to male and female students, and three prizes of £30, £20, and £10 respectively. The competitive works are to be exhibited on Tuesday, April 1, 1882, such works to be sent in not later than Saturday, April 1, 1882. The pictures must be either—1. Compositions containing one or more figures. 2. Landscapes or sea pieces. This

limitation does not apply to the £10 prize. The size of works is not to be less than 2ft. by 1ft. 6in., and they may be executed either in oils or water-colours. Each work must be unframed, and must not bear the student's name.

Application for forms is to be made to Mr. Richard J. Moss, registrar, Royal Dublin Society, Leinster House.

THE GLASGOW INSTITUTE OF MEASURERS.

THE first annual general meeting of this Institute was held on Monday, 3rd inst., when there was a large attendance of members, Mr. Howatt presiding.

It was stated that forty-eight measurers practising in Glasgow had agreed to become members of the Institute, and that the entry-moneys and annual contributions received to date, amounted to the sum of £48 16s. 6d. sterling.

The following gentlemen were elected as members of council: viz., Messrs. James Howatt, John Shields, John Dansken, Robert Scott, Nathaniel Ramsay, R. G. Stirling, M. Campbell Duff, David Robertson, A. C. Hunter, Robert Whitson, John Morrison, and M. Cunningham.

Thereafter the council met, and elected the office-bearers for the ensuing year, viz., president, James Howatt; vice-president, John Shields; treasurer and secretary, Robert Scott.

THE LATERAL DISPLACEMENT OF RIVERS.

THE phenomenon, observed in all rivers, of displacement or shifting of the channel, has been fully treated in a recent book, written by Herr Stefanovic in the Serbian tongue, the contents of which he lately utilised for a lecture to the Geographical Society in Vienna. With the aid of numerous maps and examples, the author endeavoured to prove that the following forces operate to produce the effect in question:—

(1) The carrying down of rock material by tributaries into the main river; such material being detached from off the rock surface by constant weathering, and deposited at the sides of the river-bed. The nearer the angle at which a side valley meets the main valley is to a right angle, the more marked is the pressure and repellent force on the side of the main stream, deflecting it out of its original direction. To understand this action, suppose the main river to have an east-west direction, and to receive tributaries from north and south. These tributaries convey the products of weathering from the hills on either sides; but, on the north side, the weathering is greater, owing to more direct exposure to solar radiation, so that (*ceteris paribus*) more is carried down by the northern tributary, and the main stream bends to the south. The lecturer illustrated this by numerous examples.

(2) The second force which compels a river to shift laterally is the prevalent wind:—This acts in three different ways—first, it acts during the high water of spring, forcing the waves constantly against one of the banks, and so undermining it and carrying its matter away. Next, in the case of a river very snake-like in its windings, it may occur that the narrow isthmuses left are penetrated under favorable conditions, by constant action of the waves in one direction. Several examples of this are met with in the Theiss. Thirdly, the wind, by carrying quantities of sand from neighbouring steppes and wastes, to the river bank opposite its direction, may compel the river to lateral displacement in the other direction. Examples of this occur in the Danube, the Amu Darya and other rivers.

(3) In the tropics, another factor of the result is to be found in the superabundance of vegetation in the bed of the river, so filling up the cavity, that the water overflows and seeks another course. This may be observed in the Upper Nile.

THE STONE FOR TRURO CATHEDRAL.

A MEETING of the General Committee of the Truro Cathedral was held at the Bishop's Library, Truro, on Saturday afternoon, the Earl of Mount Edgumbe presiding.

Mr. E. Carlyon, the secretary, then read the following report:—

"The most important part of the duties imposed on your committee during the past year has been that of the making choice of the stone for the building of the cathedral. Mr. Pearson, on the 10th May, read his report to the Diocesan Committee of the various kinds suitable and of the estimated cost of the various kinds; but, as as you are aware, no decision was then arrived at on that report, and the responsibility of selection was delegated to your executive Committee, and subsequently (on the 27th May) a sub-committee was appointed, with special minutes of instruction to obtain any further or more accurate information, and to report to your Executive Committee on the various stones referred to in Mr. Pearson's report. The reports of Colonel Coeks and Professor Warrington Smyth, as representatives of such sub-committee, were duly presented on the 16th of August last; but it was thought desirable, in the absence of many members, to postpone any final decision for a few weeks, the architect being instructed to proceed in the mean time with the building of the crypt with the same materials as before used. Your committee have this day decided to adopt Carnsew granite for the plain ashlar work of the outer walling, and that "Box-ground" be used for most of the dressed work outside, reserving it for Mr. Pearson's special discretion if in any portion he prefers to use "Doulting"; and that the bulk of the interior plain work for the surface of walls be of St. Stephen's granite, and interior dressings be of Bath stone or other stone at discretion of architect."

Mr. W. C. Pendarves moved the adoption of the report.—Mr. F. G. Enys seconded, and the motion was carried unanimously. After some discussion, Mr. R. Foster proposed that Mr. Pearson be requested to name one or more contractors in whom he had confidence, and lay the results before the Executive Committee, and then to decide whether they should proceed.—This was seconded by Col. Tremayne, and carried unanimously.

DISPOSAL OF SEWAGE OF COUNTRY-HOUSES.*

WE have before us a pamphlet from the pen of Mr. T. E. C. Streetfield, in which the subject of disposal of sewage of country-houses is treated. The author advocates the abolition of cesspools in their present form as receptacles of all the sewage, solid and liquid, of houses. After dealing with the evils of the old cesspools, which in a few days became filled with liquid sewage, and the want of ventilation, the author points out how the root of the evil may be attacked. Mr. Streetfield proposes to remove the cesspool close to the house, to uncover it and wall it round with an opening for access, or otherwise ventilate it by two pipes 4 to 6in. diameter, both terminating in the open air, one of these being higher than the other. The solid excreta is not to enter this receptacle, which is to be used only for the liquid portion, and the feces, &c., are to be collected in a square-shaped galvanised iron pail placed in a brick and cemented trap on the main-drain between the house and sewage tank. The trap is to be built in the usual manner, the inlet side of it to be from 10 to 15in. square. Immediately below the lip of the inlet-pipe, and easily fitting the interior of trap, i.e., from 9in. to 11in. square, is placed the pail, with a long chain for lifting, perforated with holes round the sides. The outlet is to be so placed that the liquid sewage stands slightly below the brim of the pail. By this arrangement the solid feces, sludge, paper, &c., are deposited in the pail, and the liquid passes through to the outlet. The pail requires emptying, according to the number of persons in the house, every week or fortnight. The brickwork inclosing the pail is carried up to the surface of ground and finished with a stone cover and ring for lifting, or an open grating to allow for ventilation. The plan accompanying the author's paper shows the main-drain passing the stables, below which is the pail-trap described above, and a few feet beyond this the sewage-tank for the liquid, with pump attached. The drain, after passing through the pail-trap, is taken

direct to the meadow, a small branch being made from it into the liquid-tank. By the use of stop-valves the sewage can be diverted in the direction required. The sewage-tank is emptied by the pump at regular intervals, or a cart, with pump attached, may be used, and the contents disposed of in the garden or on the fields. The arrangement sketched has, the writer says, been found to answer; in one case, the cesspools were entirely done away with, and the liquid sewage, after passing the trap, and being separated from the solid, was conveyed in pipes, and distributed on a few acres of pasture-land, with beneficial results. To avoid offensive effluvia from the tank while pumping, it should be freely ventilated or left uncovered, and the sewage from tank is best emptied in the early morning. Such, in brief, is Mr. Streetfield's plan. It is at least simple in construction, and can be easily carried out, at a very trifling expense (in some cases at the mere cost of the pail-trap), at any country house where a cesspool exists, and a few acres of pasture or garden-ground are near. The same drain may be made to answer if it runs in the required direction. Several quotations bearing on the subject are introduced from the report of the committee of the Local Government Board, 1876, and from Mr. J. J. Stevenson's work on "House Architecture," to which it is needless to refer here; the object the author attempts to prove is that by separating the solid from the liquid-sewage, before any cesspool is reached, all the ill-consequences of bottled-up sewage and gases are avoided, and both portions can be collected and disposed of promptly at regular intervals on the land. The plan is at least simple and economical, and is well worth the trial.

THE HOLLY SYSTEM OF SUPPLYING STEAM TO TOWNS.

THE system of supplying steam to towns for heating, cooking, and for engines, has been recently patented, so far as certain apparatus is concerned, by Mr. B. Holly, of Lockport, New York. In carrying out the object the method adopted, according to the *English Mechanic and World of Science*, is to use in a central part of the town a battery of boilers, from which steam mains are carried underground. Where the steam is used for power purposes in connection with steam-engines the exhaust can be readily utilised for warming, and in that manner the most economical results will be obtained. The object of the present improvements is to apply that principle of economy in connection with the whole system of steam mains, for which purpose double mains are employed, one for high pressure and the other for low pressure, and in connection therewith are automatic regulating valves, one form of which is shown on next page. The mains consist of pipes, protected in any suitable manner to prevent condensation, and fitted at suitable intervals with service boxes to allow expansion and contraction. The high-pressure main takes steam directly from the boilers at a pressure of, say, 60 pounds; and the low-pressure main returns it to the boiler house at a pressure of, say, fifteen pounds. From the service boxes in the main, service pipes will pass to the buildings for supply of steam at high pressure to the engine. The exhaust steam is delivered to the low pressure main by a return pipe, and in connection with these supply and exhaust pipes is the automatic regulator valve shown in the diagram. The low-pressure pipe, D, connects with the high-pressure pipe, C, by a short section fitted with a screw valve at its connection with pipe C. At the upper end of pipe D is a valve, F, hung from a lever that is weighted to balance the valve. This valve F is between the pipe D and connection, so that when open steam may pass from the high to the low pressure pipe. H is a cylinder containing a piston connected with the lever; a pipe leads from the low-pressure pipe, D, to cylinder H, I is a pipe connected to the low-pressure pipe D, and provided with a valve hung from a weighted lever that retains the valve closed; L is a diaphragm in a chamber connected with pipes I and D. In case the exhaust steam from the engine does not supply the requisite pressure in the pipe D and main, such decrease of pressure will allow the valve F to be partially opened by the weighted lever and steam will then pass from pipe C to pipe D until the pressure is raised sufficiently. The increase of

* On Disposal of Sewage of Country Houses. By T. E. C. STREETFIELD. London; B. T. Batsford, High Holborn.

pressure is felt by the piston in the cylinder H, which rising closes valve F more or less until the requisite fifteen pounds is reached, when the valve will be entirely closed. If from any cause the steam in the low-pressure main and pipe D increases above the normal point, such increase will act to raise diaphragm L, move the lever and open the valve, thereby allowing steam to pass to pipe I. The pipe, I, will preferably connect with heaters for warming, or in case the regulator valve is placed at the boiler house the steam will go to the feed water heaters. A cylinder, M, with piston is applied in connection with the upper lever as a dash pot to prevent vibration. This cylinder is to contain oil; and its piston is made a trifle smaller than the cylinder to allow passage of the oil from one side to the other, and thus insure a slow and steady movement. With these valves arranged in connection with the engines the low-pressure main is supplied with the exhaust steam at the required pressure, and distributes it throughout the district, returning the surplus to the central boiler-house, where it is used for heating the feed-water. In the mains near the boiler-house one of these regulator valves is placed for the purpose of supplying live steam from the boilers

in case the consumers require more than is furnished by the engines. At street intersections, or wherever the mains cross, in order to keep both at the same level, a device is placed consisting of a casting made with branch tubes connected at each end, and forming an opening for the other main to pass through. This casting is preferably applied to the heat main. With this double system of steam mains the steam is utilised to the greatest possible extent. It is desirable to connect the two mains at a remote point, and fit the connection with a valve that may be opened and closed by hand. The object of this is to prevent injury to either main when the engines do not use steam for a length of time, as, for instance, at night, and on holidays. In such case the power main might become filled with water. The valve is then to be opened, and the direct supply to the low pressure main cut off at the boiler house. This will at once start a positive circulation in the heating main from the remote point towards the boiler, and in the reverse direction in the power main. The water of condensation takes the following course:--The water from the power main passes by the connection to the heating main, and from thence to the consumers and boiler house. The pressure is regulated by the valves, as before described. This insures perfect operation when the power service or a large part of it is not in use.

PRACTICAL NOTES ON PLUMBING.— XVII.

By P. J. DAVIES, H.M.A.S.P., &c.

TRAPS (continued).

JENNINGS' BALL-TRAP (Fig. 103).

MR. G. JENNINGS was one of the first to use a ball inside a trap; his first patent is dated 1871. Another, and that which he considers a great improvement on the first, is dated 1878. This latter requires no criticism as to merits or demerits. It is simply perfection.

An examination of Fig. 103 will show you a rubber seating at S, which allows the ball B to

seat itself perfectly airtight. D shows the water in the lower lip, and G the guide to keep the

ball in its place, I the inlet, L to W the outlet.

The action of this trap is exactly the same as in those before explained.

Fig. 104 is an elevation of Fig. 103, showing the cleansing-door C.

FLOAT BELL-TRAP.

This is an improvement on Clark's float-trap; but in my opinion, for practical work, it is not to be depended upon. It is made as follows: Take an ordinary Gin. bell-trap body (J, Fig. 105).

FIG. 105.

and half a water-ball, called a ball-shell, F; solder a disc, D, about 1 in. up, inside the shell; this will at once form a float; place a guide as shown at S to work into a tube fitted to the top of the grating. This completes the trap as it is ordinarily made; but occasionally a piece of indiarubber is fitted as at B, for forming a valve to rest upon the seating E.

Please note at the bottom of the float two protruding points, K, which form the water-seal or dip-pipe outside the stand-pipe of the bell-trap. The stand-pipe answers as a valve-seating, as also a water-dam for the trap. The action is as follows: On the water running through the grating and lifting the body of the trap, the float also rises and allows the water to flow through the stand-pipe, but as soon as the water becomes lowered within the trap, the float lowers, and if very low, rests upon the top of the stand-pipe B.

"BELL-TRAP" (Figs. 106, 107, and 108).

Fig. 106 is a section, 107 an elevation, and Fig. 108 another illustration of an improved hinged grating for bell-traps.

On referring to Fig. 106, you can at once see the construction of this trap, which may be described as follows: A is the out-go, B the stand or dam-pipe, D the bell, J the body, G the grating. The action is too simple to require a description. The arrows in the diagram show the way in which the trap acts against the gases.

Fig. 109 is an improved form of bell, having a spindle, S, and a bridge, B, to prevent the bell being taken off. Now, in reference to this trap I cannot help expressing an opinion that I think will be endorsed most sincerely by those who are most practical, and consequently best able to judge in this matter. It has fallen into the hands of the brass-finishers as the manufacturers of it, and is, as a rule, the first piece of work

that their apprentices have to do (they may be excused for this, as they are so badly paid that they cannot afford to put experienced workmen on the job), the consequence is that they are seldom or ever properly made; they very rarely have sufficient water-seal, and servants or house-keepers, as the case may be, for the sake of saving themselves the trouble of keeping the grating clean, will remove the grating, and at once thereby destroy the seal of the trap. Under all these circumstances, I think I am justified in saying that the trap is comparatively useless, and under my advice would not be used.

JENNINGS' CONCENTRATED CONE-TRAP (Fig. 110).

This new patent of Jennings, which you have represented in Fig. 110, is especially efficacious in such places where it has been customary to use the last-mentioned (bell-trap).

The new patent Concentrating Cone-trap has a fixed inverted bell (B, Fig. 110), and a $\frac{3}{4}$ bell-shaped cone, C, which forms the dip of the trap, and diverts the stream from the grating-holes, H H H, to the centre of the inverted bell, thereby concentrating the separated flow or small stream into one point, which at once renders this trap one of the best, or, to say the least, one of the most useful traps at present in the trade.

ANTILL'S PATENT TRAP (Fig. 111).

This trap is best known in the trade as the Lip trap, and, like Jennings', is partly made up

with the Bell-trap body, which can be cast in one piece together with the lip N, or the two lips and body all in one casting. If the lips are not cast in, they must be soldered to the

sides of the body, by first soldering in the bottom N, and afterwards the top O. This trap has a lock grating, which is sometimes made to work with the bayonet-joint. (See Tye and Andrews' trap.)

TYE AND ANDREWS' TRAP (Figs. 112 and 113).

This trap, as represented in Fig. 112, is made after the O-trap pattern, but has an improved lock-grating, which consists in the adoption of

the well-known bayonet-joint, as shown at A. The grating shown in Fig. 113 is different in this respect, that it has a screw, as shown in the sectioned part at B. These traps being made of iron, are of course useless for watercloset work.

TRAP GRATINGS (Figs. 114 and 115).

Trap-gratings should always be made to allow, so that the trap will take away; the holes should

be made taper from the underside, as shown in Fig. 114, in which it will be noticed they are countersunk from the bottom side. Fig. 115 shows the top side, as also a strainer fixed with

screws, marked A B, the section of which is shown at Fig. 116.

In this chapter I conclude my remarks on the manufacture of traps, which, I trust, have been beneficial to at least the junior members of the trade.

Next week I shall introduce an explanation of a few new and important "practical experiments" that have lately been made on "full-sized" closet-traps.

THE ROYAL COMEDY THEATRE.

WE yesterday inspected a new addition to the theatres of the metropolis, which has been just completed from the designs of Mr. T. Verity, the Lord Chamberlain's architect, and which will be opened to-morrow (Saturday). The new Royal Comedy Theatre stands at the corner of Panton-street and Oxendon-street, in the Haymarket, and is the property of Mr. J. H. Addison, a gentleman well-known in theatrical circles. The lessee is Mr. Alexander Henderson, who has aided the architect in the planning of the building. There are a few features of the Comedy Theatre which call for notice. We may first direct attention to the means of entrance and exit provided, and the exceptional good position of the theatre, abutting as it does at the junction of two streets. Mr. Verity has been successful in being thus able to provide good entrances, and in making the best of the situation. The Panton-street entrance, which is the principal one, is very spacious, and few theatres of the size can boast of so desirable an approach. Passing through the vestibule, at the side of saloon the visitor finds himself on a spacious inner landing on a level with the dress circle, without having to ascend any stairs. On each side a well-placed stairs descends to the stalls, but these are easy, and contrast favourably with those of other theatres we have seen. The principal private-boxes are thus on a level with the street, and only six steps have to be traversed to reach the second-tier boxes. Another feature worth notice is that there are no corridors and gangways; the floors are of concrete on iron joists on the system of Dennett and Ingle and the staircases are constructed of the same fireproof material. The architect has also been happy in the choice of pleasing lines for his plan, by which means everyone can see the stage without unpleasantly keeping the neck strained. This is particularly noticed in the private-boxes. The upper gallery follows the oval line of the ceiling, the next tier of upper-boxes breaks forward a few feet in a curve of double flexure, while the dress-circle below that still farther comes forward with a flatter curve of the same kind. A pleasing gradation of the seats in respect of the stage is thus obtained; besides which, the upper part of the house opposite has a better range of sight.

The pit is large and open, and the floor is sloped so as to give every spectator a full view of the stage. The dress-circle is handsomely fitted, the upholstering and seating being in a rich deep red, by Messrs. Shoolbred, who have also supplied the decorations of the entrance saloon. The oval ceiling of the auditorium is chaste decorated with ornament of a Renaissance character. The prevailing colouring is a cream tint, and the balcony fronts and pilasters are richly relieved by gilding, without being obtrusive. There is a sun-light in the centre,

supplied by Messrs. Verity, of Regent-street, who have executed all the gas-fitting, &c. The drapery of the boxes is maroon plush, and the stall seats are upholstered in scarlet satin. We find the accommodation is large: there are seven rows of stalls, seating 140; dress-circle, 120; upper boxes, 126; amphitheatre, 100; pit, 400; and gallery 300. Every structural and other provision has been taken in compliance with the recent by-laws of the Metropolitan Board of Works, into which details we have no space now to enter. The general contractors are Messrs. Kirk and Randall, and the clerk of works is Mr. H. N. Taylor.

CHIPS.

A marble bust of Mr. Alderman Waller, who has twice been mayor of Hull, was last week placed in a niche on the main landing of the Town-hall, Hull. Mr. C. Mason, of that town, was the sculptor.

The Colchester town council last week appointed Mr. William Grimwood to be clerk of works of the main sewerage works now in progress.

It was reported to the Epworth burial board on Thursday week that the new cemetery was ready for interments. Mr. Meggitt is the contractor for boundary-wall, chapels, and lodge.

The heating and ventilation of Mount Stuart, Rothsay, N.B., now being erected for the Marquis of Bute, under the superintendence of Messrs. Anderson and Browne, architects, Edinburgh, has been entrusted to Mr. Wilson W. Phipson, engineer, London. The system selected for this important building is the forced introduction of fresh-air previously warmed, in distinct chambers, by an improved plan of hot-water and steam combined.

Messrs. McNaught, Robertson, and Co., of Bankend, Southwark, S.E., have sent us a miniature copy (suitable for the desk) of their book of sections of rolled iron and steel joists, which we reviewed on p. 41 of the present volume. We need say nothing now of the utility of the information given, except that the handy form in which it is now offered to the public considerably enhances its value for constant reference.

The King of Siam is about to furnish a new palace, and Messrs. Jackson and Graham are to carry out the work.

The parish-church of North Ockendon, Essex, was recently reopened after restoration. The floors have been laid throughout with Messrs. Godwin's tiles, and oak seats have been placed in the chancel, and an oak screen erected between the Poyntz chapel and the chancel and another under the lower arches; the builder was Mr. Anstey. At the same time, an alabaster reredos, set in oak frame, and representing the Last Supper, and an oak lectern, have been executed and placed in the church by Messrs. Farmer and Brindley, of Westminster Bridge-road; the architect was Mr. Armstrong.

New Centenary Schools at North Heigham, Norwich, attached to St. Bartholomew's Church, were opened on Tuesday week. They are placed parallel with the church, and, like it, are faced with flint and stone dressings; the roof is of pitch-pine; the dimensions are 60ft. by 25ft., and accommodation has been provided for 300 children at a total cost of £750. Messrs. Young and Son, of Norwich, were the builders.

The Brentford board of guardians proceeded last week to the election of a clerk of works on the new schools. The salary offered was three guineas per week, and there were upwards of thirty candidates. A member called attention to the fact that Mr. Morison, the architect of the schools, was present, and moved that he be asked to retire. This was opposed as unreasonable, but, on a division, was carried by 9 to 7 votes, and Mr. Alfred Davies, late foreman to a local builder, was then elected.

A fine art and industrial exhibition was opened in the Castle Hall, Taunton, on Wednesday week. Six cases of art treasures have been lent by the South Kensington authorities, and there is a large display of paintings by modern artists.

A new organ, built by Messrs. Ma'ey, Young, and Oldknow, of London, at a cost of £150, was dedicated in Orsett parish church, near Grays Thurrock, on the 7th inst.

At Darlington, last week, a new theatre, seated for 2,500 persons, and erected from the designs of Mr. W. Hodgson, of that town, was opened.

A new Independent chapel at Pontyrr-hill, Gars Valley, is approaching completion. It will be known as Capel Godderynydd, and will seat 200 persons. The Rev. T. C. Griffiths is the architect, and the contractors are Messrs. Jones and Lewis, of Maesteg.

BARROW COURT, NEAR CHESTER.—LITTLE PARK HOUSE, CHISWICK.—STUDIO FURNITURE, HOVE HOUSE, CHISWICK. ST. CUTHBERT'S CHURCH, KENSINGTON.—MEDIEVAL SEALS AS WORKS OF ART.

OUR LITHOGRAPHIC ILLUSTRATIONS.

BARROW COURT, CHESHIRE.

BARROW-COURT is pleasantly situated on an elevated site about three miles from Chester. From the top of the tower a magnificent and extensive view of the surrounding country is obtained, taking in on one side a great part of the Wirral peninsula, and the river Mersey, with the Lancashire coast on the other side, and on other, the Moel-Fanmaw range of Welsh mountains, Beeston Castle, and the Peckforton hills, Hulton Castle, &c. The plans and view will explain the style and character of the buildings, which are built of red brick, the roofs being covered with green Cumberland slates of small sizes. A feature in the house is the extensive use of special made bricks and terra-cotta for the windows and all the external dressings; these, together with the face bricks, have all been supplied from the works of Mr. Henry Bowers, of Runcorn. The interior joinery to best part of the house is being carried out in oak. The contractor is Mr. Richard Beckett, of Hartford, and Mr. Allan Lloyd has acted as clerk of works. The plans have been prepared, and the work is being carried out under the superintendence of, Mr. Douglas, of Chester.

LITTLE PARK HOUSE, CHISWICK.

THE site of this house is the south-west angle of the fine old garden of Park House, Chiswick, and has a frontage on the south to a second-rate street. This explains the *motif* of the plan arrangement. The small windows of the principal rooms facing the street are to be filled with lead glazing, so as to secure sunlight without outlook. The walls are of stock bricks with red Farnham quoins and dressings. The decorative brickwork and panels are mainly formed of Mr. James Brown's model bricks, thus reducing the cut-work to a minimum. The builders are Messrs. Adams, of Turnham-green, and the architect, Mr. C. M. Stclair, of 7, Telford-avenue, Streatham-hill.

STUDIO FURNITURE, HOVE HOUSE, CHISWICK.

A STUDIO is essentially a workshop, and, therefore, the first consideration in planning such an apartment must necessarily be of a practical character. The same rule should govern all its fittings and furniture, at the same time bearing in mind the desirability of avoiding distracting features or violent decorations such as would influence the colour-sense or engage the eye of those working within the studio walls. Use and convenience, without waste of space, have been the limiting lines of the furniture illustrated herewith to-day. The material used is American ash, brought to a bright dark colour, and

finished with a dead polish. Messrs. Robertson and Sons, of Alnwick, a well-known firm of art-furniture manufacturers to the trade, executed the designs in a very satisfactory manner. The over-mantel is the work of Mr. Alfred Robinson, of High Holborn, and this is painted in harmony with the general wood-fittings of the room. The centre of the chimney-piece is occupied by a convex mirror, the panels on either side being for figure paintings. The two shelves are provided for the display of china pots and ornaments. The grate is one of Boyd's gill-back stoves, and throughout the severe weather of last winter answered admirably. The front is enriched with tiles. The bookcase accommodates two mount-frames of rare butterfly specimens in a specially-arranged space in front of the print-drawer, the pull to which is obtained by an ornamentally-shaped verge below, thus giving an entire command of the drawer. The heights were fixed by the dado-lines and cornice. The wardrobe for costumes fits into a recess, and has three doors, so that all the space can be readily reached, and suspending-hooks occupy the whole ceiling, thus affording means of storing away a large number of articles. The lower part, having a fall-down front, is used for guns, assegais, swords, and other properties. The table is specially made for drawing on the wood, racks being provided in the top to support the reversing looking-glass, and for the sketch to be reversed. The raised desk, with its adjustable rack, forms the plane on which the block is drawn upon. Five small drawers in the front give accommodation for many tools and appliances, while a useful long and deep drawer is arranged the whole length of the table on the other side. The ends are treated with raised mouldings, like the wardrobe and bookcase fronts. The pedimented heads to the wardrobe are raised from the face of the framing, and give an effect only seen in perspective. The throne is simply a raised dais for models. The studio for which these things were made was illustrated in the BUILDING NEWS as our "Artists' Home" (No. 6), when plans were given. Mr. Maurice B. Adams, A.R.I.B.A., is the architect of the work, and under whose superintendence it has been carried out, for Mr. J. C. Dollman, the artist.

ST. CUTHBERT'S CHURCH, KENSINGTON.

OUR illustration shows an exterior view of a church to be built in Philbeach Gardens, Kensington. The walls are of concrete faced with brick, terra-cotta being used extensively throughout in lieu of dressed stone. A crypt will be formed beneath the greater part of chancel, nave, and aisles, the gravel of which the site consists being excavated and used in concrete for the walls. The crypt will form a temporary church, with accommodation for about 500 worshippers, whilst the main building is being erected. It will also contain vestries for clergy, and a choir and mortuary chapel; afterwards it will be available for parish meetings, &c. The church will accommodate about 1,000 persons, will consist of a nave 91ft. 6in. by 28ft. (with a baptistery at the west end), north and south aisles of a similar length, and each 12ft. 9in. wide; chancel 42ft. 6in. by 28ft.; morning chapel, 32ft. by 16ft. 6in.; a sacristy and organ bay. The height from nave floor to the ridge will be 72ft.; the apex of the fleche will be about 150ft. from the ground-line. The east wall of chancel will be without a window, but will be enriched with figure subjects, in niches within a bold and lofty arch. The figures in the upper tier will be Christ enthroned, in the centre, the Blessed Virgin, St. John, and two censuring angels. In the lower panels, St. Cuthbert (the patron saint) in the centre; and the four great doctors of the Western Church, SS. Gregory, Ambrose, Jerome, and Augustine, in the remainder. Below these a passage-way behind the altar is formed, communicating with the morning chapel. A clergy-house will be attached to the church at the north-west angle. The patronage is intended to be vested in five trustees, viz.:—Canon Liddor, Canon Thynne, the Earl of Strathmore, Lord Coleridge, and the Hon. C. L. Wood. Mr. Hugh Roumieu Gough, F.R.I.B.A., of 6, Queen Anne's-gate, is the architect employed.

MEDIEVAL SEALS AS WORKS OF ART.

For description of this sheet, see article on p. 486, *ante*.

ARCHÆOLOGICAL.

SURVEY OF EASTERN PALESTINE.—It has been found necessary to commence this work at the south instead of at the north, as was originally intended. On the arrival of the theodolites, therefore, Lieut. Conder lost no time in making the necessary arrangements, and took his party across the Jordan, his first camp being at Ain Hesbon, the old Heshbon. He reports that his base line has been twice measured with as great accuracy as was obtained in the preceding survey, and that he has already accomplished some hundred miles of survey. Among the archæological results are an immense quantity of cromlechs, no fewer than 50 having been sketched in three days. Some of them had small chambers near them, from three to five feet long, and three feet high, excavated in detached cubes of rock ten to fifteen feet on each side. Lieut. Conder reports a small harvest of identifications. He thinks he has found the Field of Zophim, the Ascent of Lubeith, Jazer, Sibmah, and Minnith. Before going across, also, he established his identification of Kirjath Jearim, which he had already suggested, and made a squeeze and tracing of the inscription in the Pool of Siloam, which, with a paper written upon it by Professor Sayce, is published in the October number of the Society's Journal. The latest Report from Heshbon, with the identifications and drawings of the cromlechs, came too late for the new number.

CHIPS.

Any one desirous of obtaining the latest and quaintest thing out in the way of circulars, should send to Mr. Harry Hems, of Exeter. The engraving at the head of the circular is unique.

A mission-room in Nelson-street, Cambridge, was opened on Saturday week. Mr. Frank Waters was the architect, and Mr. J. Denson, also of Cambridge, the builder. The cost of erection was £600.

Plans prepared by Messrs. Kinnipie and Morris, C.E.'s, of Westminster, for a dock at Great Yarmouth, were exhibited at a meeting held in that town on Wednesday week, and recommended to the town council for consideration. The proposal is to make a tidal basin between the east side of the haven and the Marine-parade, 1,100ft. by 400ft., or 103 acres in area, and 18ft. deep at low water, and the estimated cost is £70,000.

The first sod of new works of water supply for Beverley was turned, on Wednesday, on the site of the reservoir at Queen's-gate. The works are to be completed in twelve months, and will be carried out under the supervision of Mr. Fairbank, C.E. The contractors are Mr. Bell, of Gateshead, Mr. Rigby, of Workop, Mr. Bagshaw, of Batley, and Mr. Horsfield, of Dewsbury.

The east window of All Saints' Church, Brightlingsea, has been filled with stained glass by Messrs. Heaton, Butler and Bayne, of Garrick-street, London, W.C. The subjects of the three lights are the Nativity, the Crucifixion, and the Resurrection.

Owing to the encroachment of the sea on the coast near Cromer, it has been found necessary to rebuild the parish-church of Sidestrand on a fresh site further inland. The new church was consecrated on Michaelmas-day by the Bishop of Norwich. It consists of nave, chancel, south porch and tower, and seats 140 persons. The stones and material of the old building, except those of the tower, which is left standing on the cliff, have been reused. Mr. Cornish (Cornish and Gaymer), North Walsham, was the contractor, and no architect was employed, the new building being as far as possible a reproduction of the former one. The cost has been about £2,000.

The church of Dowles, near Bewdley, is undergoing restoration from the plans of Mr. Nicholson, of Hereford. An open-timber roof is being substituted for the present plastered ceiling, the roof above is being retiled, a wooden chancel arch is being erected, an apse and timber porch added, and encaustic tiles laid down. Mr. Parton, of Wribben-hall, next Bewdley, is the contractor.

At Bromley, Kent, the Wesleyan chapel was reopened last week, after the erection of organ, at an outlay of £350, and the extension of schoolroom. The latter work, which cost £550, was carried out by Mr. Grubb, builder, of Bromley.

New schools at Gilfach-goch have just been completed for the Llantrissant School Board. Mr. J. J. Evans is the architect, and Mr. John Morgan, of Pontelown, the contractor. New schools are being built for the same board at Williamstown, from the same architect's designs; the contract has been let to Mr. David Morgan.

EGGOTT'S PATENT WINDOW LIFTING ARRANGEMENT.

THIS apparatus provides an easy and inexpensive method (always at command and under ready control) for ventilating any apartment by the opening of a window, either at top bottom, or both, by one operation. It affords the same time great security against thieves, the sashes, whether closed or opened, in the position in which they are left are perfectly locked. The invention is equally suitable for sashes of the heaviest or lightest kind. It dispenses with all sash-cords, sash-weights, sash-stoppers, and the consequent annoyance and expense of repairs, which always attend the antiquated system of window-lifting hitherto obtained. Whatever the height of the window, it can be opened, repaired, or cleaned, both internally and externally, from inside, avoiding the use of ladders or steps, and all risks to life or limb. It is simple in construction, and strong, difficult to put out of order, and easily reset. The inventor informs us that Mr. John Hicheord has sent over two specimen windows, fitted with the apparatus, to the new Houses of Parliament at Capetown, and that it is not improbable the invention will be used throughout that building.

PATENT ENCAUSTIC AND MOSAIC TILES.

MESSRS. T. and R. BOOTE, of Burslem, old and well-known manufacturers of patent encaustic, mosaic, and ornamental tile, pavements, tiles, hearths, &c., have issued a handsomely got-up book of designs and price-list of their tiles. The designs, illustrated in colours, display some good examples for floors of all descriptions, and from plain squares and diagonal patterns to elaborate geometrical combinations. These are drawn to a scale of $\frac{1}{4}$ in. to the foot. The black, buff, and white arrangements are striking, and are in patterns suitable for all styles of building. The tiles for walls are of equal merit and variety of design. There are also plain glazed tinted tiles for walls, or dados; hearth-tiles; hand-painted tiles for replays, furniture, flower-boxes, and other decorative uses. The catalogue contains 22 carefully printed plates of designs, accompanied by a price-list which cannot fail to be useful in the architect's office. The colours of the tiles are generally well selected, and we need hardly say, as far as the material and manufacture are concerned, the tiles made by this firm have long since won a well-deserved reputation.

ANCIENT JAPANESE BRONZE BELLS.*

By Prof. EDWARD S. MORSE.

MR. MORSE described the so-called Japanese Bronze Bells which are dug up in Japan. These bells had been described and figured by Prof. Monroe in the "Proceedings" of the New York Academy of Sciences. Mr. Kanda, an eminent Japanese archaeologist, had questioned their being bells from their peculiar structure.

Mr. Morse had seen a number of bells of different kinds, some of considerable antiquity, but none of them approached these so-called bronze bells. Mr. Kanda had suggested that they were the ornaments which were formerly hung from the corners of pagoda roofs; but the fact that none of them showed signs of wear at the point of support, rendered this supposition untenable. Mr. John Robinson, of Salem, the author of a work on ferns, had given the first suggestion as to the possible use of these objects.

He has asked why they may not have been used to incense burners. Curiously enough, old incense burners are dug up which have the same oval shape that a section of the bell shows. The "bell" has openings at the base and also at the sides and top, so that the smoke of burning incense might escape. It is quite evident that these objects are neither bells nor pagoda ornaments; and this suggestion of Mr. Robinson's may possibly lead to some clue regarding their origin.

A turret clock, constructed by Messrs. Thwaites and Reed, Clerkenwell, has been placed in the tower of Writtle parish church, near Chelmsford.

Building Intelligence.

BIRMINGHAM.—One of the most recent additions to the architectural features of this town, the new Central Arcade, extending from Corporation-street to Cannon-street, is now completed. It has been erected for the proprietor under the able superintendence of Mr. W. H. Ward, architect, the style adopted being a free treatment of the Renaissance. The whole of the interior is faced with stone, with the introduction between the shops of granite pillars, and springing from these at the top of the arcade are some light iron principals, carrying a roof which is filled with stained glass. There is a considerable amount of decoration in gold and colour on the flutings and frieze. The shops are fitted with every convenience, and the offices above have easy access from the street. Underneath the shops, with entrances both from Corporation-street and Cannon-street, is the new Central Restaurant and Grill-room, which is lighted by means of a glass and iron roof, which forms the floor of the Arcade. There is a double row of handsome gas pendants on each side of the avenue, and as each pendant is furnished with an opal lamp in imitation of a Chinese lantern, a novel and most pleasing effect is produced. In addition to the ordinary lights in the arcade there are clusters of lights at each entrance. The contract for the erection of the building has been carried out by Mr. J. Garlick; the whole of the glass-work was executed by Messrs. J. and O. C. Hawkes, of Bromsgrove-street, and the ornamental wrought-iron gates were manufactured by Messrs. T. Brawn and Co., of Clement-street, Birmingham.

BRISTOL.—The completion of the nave and aisles of St. Mary's Church, Tyndall-park, was marked by special services yesterday. These form the second instalment of the permanent building, and are decorated in style and constructed in local sandstone. The nave is 84 ft. in length and 26 ft. wide, and is separated from the aisles by four arches, each 22 ft. high and 20 ft. span, springing from circular shafts with moulded bases and carved caps. Above the arcade is a clerestory, having a three-light window over the apex of each arch. The height of nave is 40 ft. to the beam, and 61 ft. to apex of roof. On either side is a lean-to aisle of equal length and 12 ft. wide, having two-light windows. The nave-roof is covered with Staffordshire tiles, with ridge pieces, by Mr. Cooper, of Maidenhead. The internal roof is an open-timbered, king-post one of pitch-pine. Beneath the nave is a room seating 200 persons. The foundations have been laid of a tower at the north-west angle, the only feature now remaining for the completion of the church. Mr. J. Piers St. Aubyn, of London, was the architect; and Messrs. Stevens and Barstow, of Bristol, were the contractors. Mr. E. Sheppard, of Bristol, executed the carving. The total cost was £3,700.

BROUGHTON PARK.—In connection with the Broughton Park Congregational Church, Manchester, a new Sunday-school was opened on Monday. It is situated on a corner plot of land in Bury Old-road, and the design is in the Late Decorated Gothic style. The facade consists of the large gable forming one end of the roof; below are projecting double porches, flanked by staircases with hipped octagonal roofs, and terminating against double gables on the north and south elbows. The building is of stone. There are several classrooms, with a large central hall, accommodation being provided for about 300 boys, girls, and infants. The total cost, including the erection of a boundary wall, has been £2,500. Messrs. W. Southern and Son, of Salford, are the contractors, and the architect is Mr. A. H. Davies-Colley (Messrs. Colley and Brook).

CHEADLE.—Alterations are in progress at the Primitive Methodist chapel, Cheadle. The chapel will be re-seated in varnished woodwork, and a panelled wall-dado will be formed out of the old seat-framing, painted dull green. A double vestibule entrance is being built at the front, carried up one story only, and finished with an inscribed pediment and balustrade; above which the main wall (with three-light window) sets back. The front is flanked by the two angle piers carried up as gables, and is relieved by strings, architraves, and pediments of red brick. Internally, the present flat plastered ceiling is stripped off, and the timbers of

the roof encased with reeded boarding, considerably increasing the cubical content. A neat rostrum, painted like the dado, will occupy a small domed apse, projecting from the rear gable. The addition of a small porch at the back will protect the entrance to schoolroom and chapel at this end from cold draughts. The schoolroom on side of chapel is divided from it by a balustraded arcade with sliding shutters, as it is intended to form part of the chapel at large gatherings. This arcade is placed so as to give persons in the school a good view of the rostrum. Some extra windows are inserted in the side and end walls of the chapel, the existing windows raised, and the whole of them reglazed in new moulded frames. The amount of the estimates for the whole of the alterations, which were contracted for by several builders, is about £500. The builders accepted are Messrs. Samuel Wagh, William Ball, and William Shuffelbotham, all of Cheadle. Messrs. William Sugden and Son, of Leek, are the architects.

IPSWICH.—The memorial-stone of the restoration of St. Lawrence's Church-tower was laid on Tuesday week by the Mayor of Ipswich, Mr. A. Winch. The external surface of the tower, which is over 90 ft. high, has recently shown signs of failure, and, a few weeks since, some rubble and plaster fell into the neighbouring Dial-lane. The whole of the exterior is being cleansed down, and will be recased with flintwork and inlaid stone tracery. The belfry windows will be renewed in Portland stone, which will also be used for quoins throughout; and beneath this stage will be a band of diaper-work and panel tracery. The tower, which, till now, had urns on each angle, will be surmounted with a pierced parapet and angle pinnacles, adapted from an ancient drawing in the possession of the high steward of the borough. Mr. Frederick Barnes, F.R.I.B.A., of Ipswich, is the architect; Mr. George Borrett, the builder; and Mr. Tooley, late of Bury St. Edmund's, the clerk of works. The cost will be £1,350.

NEWTON HEATH.—On Saturday afternoon the foundation-stone of a new church, dedicated to St. Anne, was laid at Newton Heath, near Manchester. The style is Early Pointed. The main structure will be of brick, the whole of the outside walls being faced with parpoint stone, and Halifax stone dressings. In plan the church consists of nave, north and south aisles, chancel, organ-chamber, clergy and choir vestries. The width of nave and chancel is 24 ft., and the width between north and south aisle walls 51 ft. The length internally of the nave is 83 ft., the length of chancel 34 ft. The arcades are supported on polished granite columns, and the roof is open-timbered, collared near the apex for ventilation. The cost, including lighting and heating, is £3,947. The architect is Mr. A. Wellington Smith, of 42, Market-street, Manchester, and Liverpool, and the contract has been let for the amount above stated to Mr. James Herd, Manchester.

The new premises of Ernest E. Pither and Co. artists in stained glass, tiles, and decoration, a No. 38, Mortimer-street, Cavendish-square, may now rank as one of the exceptionally good business fronts in London. A judicious and eminently successful combination of stained glass, made by the Gateshead Stained Glass Company, for whom Mr. Pither is London agent, renders the place specially decorative at night when lit up from the inside. The front has been designed and executed under the superintendence of Mr. Francis L. Pither, architect.

The Chiswick improvement commissioners are in a despairing mood as to the frequent infringements of the by-laws by builders, in consequence of the difficulty and delays experienced in bringing test cases before the Hammersmith police magistrates. At a meeting of the board, held last week, the surveyor, Mr. H. O. Smith, said not a week passed without his seeing most flagrant cases of infringement, but when he went into the police-court he met with no encouragement. Three weeks ago he had eight cases on hand, none of which had yet been adjudicated upon, and some of these buildings had now been roofed in. The clerk added that even in case of conviction the fine was optional with the magistrates, who generally inflicted a fine of half-a-crown, and the builder laughed at the commissioners, because he had gained perhaps £100 by scamping his work. The clerk was directed to prepare a draft letter on the subject for transmission to the Home Secretary.

* Read before the A.A.A.S., Cincinnati, 1881.

COMPETITIONS.

BARROW-IN-FURNESS BOARD SCHOOLS.—At the last meeting of the Barrow School Board, held on Tuesday week, a long discussion took place with reference to the decision at the previous meeting to accept the design under mottoes "Knowledge is Power, No. 2," and "Desideratum," for the two proposed new schools, the supporters of Mr. Barker urging that his plans were preferable to either. Ultimately, the motion for selecting the above plans was rescinded, thus reopening the whole question.

CABMEN'S SHELTERS.—The committee of the Cabmen's Shelter Fund have had an architects' competition for an improved cabmen's shelter design. There were thirty-five entries, coming from all parts of the country. The committee have ultimately awarded the prize of £10 to Messrs. Harvey and Clarke, of London, and one of these new shelters will shortly be placed at the "York and Albany" cab-stand, Regent's Park.

HAGGIFORD BRIDGE.—The Weardale District Highway Board recently invited competition plans and estimates for the erection of a bridge over the river Wear at Haggiford, near Eastgate. Six sets were sent in, and those by Mr. E. Lyall, C.E., of Darlington, for an iron bridge, estimated cost £681 7s. 3d., has been adopted. The proposed cost varied from £210 to £1,200, both extremes being for masonry bridges, and all the competitors were residents in County Durham.

HOSPITAL FOR SICK CHILDREN, BRISTOL.—Designs for the above were invited by advertisement in the local papers, and a number of architects responded. After several meetings, and careful consideration of the various designs by the committee and medical staff, those prepared by Mr. Robert Curwen, of London and Liverpool, were adopted. The hospital is intended to accommodate 77 patients.

CHIPS.

In cutting the jamb of the western window in the south aisle of Tamworth parish church, now under restoration, the workmen found, last week, a little leaden case, on which was stamped, "Open me, and you shall see what was done in 1783," and the name "Panton," supposed to be that of a plumber of that period. The case contained a decayed document, which has not yet been deciphered.

The town-council of Bath considered, on Tuesday, a long-standing bill from the surveyor of works, for £15 1s., for surveys and reports and commission on works executed, and on the recommendation of a special committee, appointed three years since, resolved to offer £398 2s. in full settlement.

Mr. Kernen, district surveyor to the Sittingbourne highway board, has disappeared. He was about to relinquish the appointment, but failed both to deliver up his account book, and to attend the Government audit.

The memorial to the late Sir Edwin Landseer, for erection in the crypt of St. Paul's Cathedral, by Mr. Woolner, R.A., has just been finished in model, of which the monument itself will be a reproduction. The memorial will be of white marble, 8ft. 6in. by 4ft., and will have in the centre a medallion head of the painter, and beneath a relief-copy of his well-known picture, "The Chief Mourner," representing a shepherd's dog with its head resting on the coffin of its late master.

A stained-glass window representing St. Peter and Paul, the marriage of Mary and Joseph, the Nativity, Christ and the Centurion, and the Resurrection has just been placed in the Roman Catholic Church at Eccleshall. Mr. Whadcock, of Eccleshall, executed the work.

Extensive alterations have just been made to Board-schools at Sharnhall-street, Walthamstow. Mr. Longmore was the architect, and Messrs Palmer and Sox were the contractors.

The Liverpool Art Club, who have just moved to more commodious premises in Upper Parliament-street in that city have signalled the opening of the new club-house with an art exhibition. This was inaugurated by a *conversazione* on Monday. The pictures are oil-paintings of the British school prior to 1801, and representative works of about 100 artists, lent by as many owners, including the Earl of Derby, grace the walls.

The foundation stone of new national schools was laid at Leeson Park, Dublin, on Friday. The buildings will cost for erection and furnishing £2,000, and are to be carried out from the designs of Mr. J. Rawn Carr II, architect, of Dublin.

"To a practical man with a taste for mechanics, and the bumps of contrivances fairly well developed, we can conceive no higher mental treat than a couple of hours spent over the June numbers of that truly marvellous publication the *Engineering*. In a hundred and fifty odd pages that make up the bulky mass of letter-press, there is recondite information on almost every conceivable subject, ranging from how to construct a mouse-trap, to the latest method of calculating the phases of Orion."—*The Brightonian*. Price Twopenny of all newsmen, or post free 24d.—31, Tavistock-street, Covent garden, W.C.

TO CORRESPONDENTS.

[We do not hold ourselves responsible for the opinions of our correspondents. The Editor respectfully requests that all communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondence.]

All letters should be addressed to the EDITOR, 31 TAVISTOCK-STREET, COVENT-GARDEN, W.C.
[Cheques and Post-office Orders to be made payable to J. PASSMORE EDWARDS.]

ADVERTISEMENT CHARGES.

The charge for advertisements is 6d. per line of eight words (the first line counting as two). No advertisement inserted for less than half-a-crown. Special terms for series of more than six insertions can be ascertained on application to the Publisher.

Front Page Advertisements 2s. per line, and Paragraph Advertisements 1s. per line. No front page or paragraph Advertisement inserted for less than 6s.

SITUATIONS.

The charge for advertisements for "Situations Wanted" is ONE SHILLING for TWENTY WORDS, and Sixpence for every eight words after. All Situation advertisements must be prepaid.

Advertisements for the current week must reach the office not later than 5 p.m. on Thursday. Front page advertisements and alterations in serial advertisements must reach the office by Tuesday to secure insertion.

TERMS OF SUBSCRIPTIONS.

(Payable in Advance.)

Including two half-yearly double numbers, One Pound per annum (post free) to any part of the United Kingdom; for the United States, £1 6s. 6d. (or 6dols. 40c. gold). To France or Belgium, £1 6s. 6d. (or 33f. 30c.). To India (via Brindisi), £1 10s. 10d. To any of the Australian Colonies or New Zealand, to the Cape, the West Indies, Canada, Nova Scotia, or Natal, £1 6s. 6d.

Cases for binding the half-yearly volumes, 2s. each.

NOTICE.

Now Ready.

Vol. XL. Price 12s. A few bound volumes of Vol. XXXIX. may still be had, price Twelve Shillings; all the other volumes are out of print. Most of the back numbers of former volumes are, however, to be had. Subscribers requiring any back numbers to complete vol. just ended should order at once, as many of them soon run out of print.

Tyao. (Rather a wide question. The list of subjects embraces the education of an architect and a civil engineer. For elementary information, you can hardly do better than get Weale's series and the South Kensington textbooks on "Construction"—W. R. (Write Secreury, 12, Great George-street, S.W.)—W. GANDY. (Your criticism is in the main correct. The perspective is undoubtedly shaky, but there were some unusual difficulties in connection with making the drawing, which, to a considerable extent, excuse the artist who did it.)—A. STURDENT. (No magazines worth reading White-Parker, Strand, and Batsford, 52, High Holborn, for lists of books)—B. O. B. (You cannot have a better)

Correspondence.

HOUSE-DRAINAGE AND SEWER AND GULLEY VENTILATION.

To the Editor of the BUILDING NEWS.

Sir,—The suggestion made on page 443 by "S. T. G." to trap the end of every street sewer is likely to do as much harm as good I fear, while it would cause a great extra expense, and would not save a farthing of outlay as regards the execution of the drainage of the house upon a safe and proper plan.

If "S. T. G." imagines that, by putting in traps on the sewers at each street that, thereby, the necessity for having a disconnecting trap between such house and the sewer would be done away with, that is a mistake. The necessity or advisability of isolating each house would still continue the same. This is shown from the practice where a good job is made of isolating even the house's own drains from its soil-pipes and waste-pipes. Safety in the use of sanitary appliances in houses consists in isolating each as much as possible, so that, supposing a hole or leak occurred in the soil or waste-pipe beyond the trap at the appliance, no bad air from either drain or sewer could come out at said hole. As yet, this is far too often the exception; but, by

and-by, it will become the rule. Short-sighted selfishness is continually putting on the brake to its own harm; but yet progress is being made.

The letter from "W. B." of York, on pp. 477-8, is very good for the most part; but I can hardly agree with his suggestion to use rain-water pipes to ventilate the sewer except in those cases where the pipe went up outside of the building, and there was no chance of bad air from the sewer blowing into windows or getting in below the slates.

This latter objection could be met in some cases by carrying up the rain-pipe high enough to blow off air above the slates, allowing the rain to enter by a branch side-pipe.

In regard to the gullies in streets, when trapped, drying up, as "W. B." says, in a short time—that must be owing to their having too little water lock. In this case, having them narrow with sufficient depth is better than being too shallow, and with an unnecessarily large surface exposed to the air.—I am, &c.,

W. P. BUCHAN.

WINCHCOMBE BOARD SCHOOLS.

Sir,—In reference to a paragraph on p. 470 in the last issue of the BUILDING NEWS, on the subject of tenders, &c., for Winchcombe Board School, we beg to inform you that at the meeting of the board on Friday last we submitted a tender from a responsible builder amounting to within 10 per cent. of our original estimate—viz., £1,000, which so far met with the approval of the board, that they gave instructions for the said builder to amend his tender in consequence of certain alterations which they desired.

The board will not meet again till the end of the month, when the amended tender will be considered. We will, therefore, say no more at present on the subject.—We are, &c.,

MEDLAND AND SON.

Gloucester, Oct. 10.

SMEETH CHURCH, KENT.

Sir,—Allow me to contradict most emphatically the assertion in your current number that "the Rev. — Loftie," aided and abetted by Messrs. Micklethwaite and Middleton, is about to "restore" the church of Smeth.

I have subscribed a small sum to replace a stone of the Norman chancel-arch, removed for the monument of my ancestor, Paul Loftie, two hundred years ago, but only on condition that the "local builder," who is employed, avoids touching the monument or repainting the arms. My friends, the architects above named, were kind enough, when I consulted them privately on the subject, to inform me that, in their opinion, the contemplated improvements in the church were not likely to be injurious to its historical interest.

That they and I should be described as engaged in a work of restoration, in the usual sense of that misused word, almost amounts to a libel, considering the long fight we have all three waged independently against the falsification of architectural records.—I am, &c.,

W. J. LOFTIE.

Chapel Royal, Savoy, Oct. 11.

FIRES IN THE CITY.

Sir,—It will not be denied that not only vast amounts in property-value, but also many human lives (I believe it would be correct to say the great majority of all that have been lost by fires in buildings), have fallen sacrifices to the want of staircases of fire-resisting capacity.

The question, therefore, is one of first importance, and it is difficult to understand why it has received so little attention.

The number of buildings, either public or residential, in which the materials and method of construction of the staircases have been carefully considered with a view to fire-resistance is very small.

The majority of stone staircases, even, are of stone that is rapidly destructible by fire, and are carried by unprotected ironwork, liable to quick destruction by fire.

A method of staircase construction, giving the maximum of fire-resistance with great economy in cost, has been employed in many public and private buildings during a few years past, and, I believe, only requires to be more widely known in order to obtain more general adoption.

The fireproof staircases of the Aberdeen, new

Sadlers' Wells, new Princess's, and new Savoy Theatres, Sandall-road Schools, Portland-place mansions, numerous residences, and other buildings, have been constructed by this method in monolithic fireproof concrete, the concrete used being compounded of cement of great fire-resisting capacity, and an aggregate practically indestructible by fire.

Iron is used only where, from lack of wall bearings, as in open string staircases, additional strength is required, and is, in all cases, built into the body of the concrete, being thus perfectly encased in fireproof concrete, and protected against the action of fire.

Greatly superior to stone staircases in fire-resisting qualities, the cost is very much less, and superior decorative finish is obtainable.

Respecting another point mentioned in the letter on this subject in the *BUILDING NEWS* of the 7th inst., it is important to note that fireproof concrete doors have recently been adopted for the new Haymarket Theatre, new Savoy Theatre, Vaudeville Theatre, and Lyceum Theatres in London, and the Theatre Royal in Manchester, and that these also are superior to iron doors for fire-resistance, and cost less.—I am, &c.,

CHARLES DRAKE.

WANTAGE CHURCH.

SIR,—Will you allow me a few lines of your valuable space to plead, before it is too late, for the preservation of a most interesting feature of Wantage Church, which is condemned to be destroyed—i.e., a south porch with a good parvise-chamber over it, and a turret staircase to it.

It has been found necessary, in order to accommodate the great congregation which (thanks to the exertions of the late vicar, Canon Butler) assemble at frequent services, to enlarge the church. This is being done under the direction of the eminent architect, Mr. W. Butterfield (who, I am informed, gives his services gratuitously), by taking down the west wall and adding another bay to the nave; so far so good.

On the south side of the present church there stands a most interesting picturesque old porch, with a parvise over, and a staircase turret leading to the parvise. It is proposed to pull down this porch and to rebuild it at the west end of the south aisle, for what reason I cannot imagine.

One great objection to this alteration seems to me to be that whereas the present porch enters the church now nearly on the level, it will be when rebuilt (owing to a fall of the ground westward), five steps above the churchyard, and as this is the main entrance to the church, it will be readily understood what danger will accompany the exit of a large congregation on a dark night, to say nothing of the loss of one of the most interesting features of Wantage Church.

I ought to say that the church was most admirably restored by Mr. G. E. Street some years ago, and I am sorry it is necessary to interfere with the old proportion.

Perhaps the present architect, upon reconsideration, will modify his views as to the destruction of the porch. If he will kindly do that, I think all lovers of old work will be grateful to him.—I am, &c.,

EDWIN DOLBY.

40, Great Marlborough-street, Regent-street, London, W., Oct. 12.

THE "SATURDAY REVIEW" AND FREEMASONRY.

SIR,—Will you kindly spare a little of your space to allow me to express my surprise that you should have reprinted part of the article from the *Saturday Review*, as the subject has but little connection with architecture or building, and is distasteful to a very large number of your subscribers.

I believe that the Church of Rome is quite mistaken in its ideas of Freemasonry; but if it is foolish enough to suppose that it can ever injure the Craft in this country, it is difficult to understand why papers like the *Saturday Review* should repeat the abuse and untruths promulgated by the Romish press.

As to the antiquity of Freemasonry, does anybody suppose that it was invented and established in, or about, 1717? it would be equally truthful to say that the Church of England was created by Henry the Eighth. Masonic emblems are found on ancient monuments, Masonic signs are in use among Oriental and even savage nations, and Masonic societies

have existed in the East from time immemorial. Let any earnest student study the writings of Woodford and Whytehead.

Then as to the objects of Freemasonry: its charity is well-known; its three institutions are supported by the Craft by donations of about £10,000 per annum; its social qualities cause many to be brought together, who but for it would be wide apart; and as to its aspect from a religious point of view, I would state that all sects can meet in its lodges, the belief in the Creator being the only profession of faith required; and as regards the charge of profanity in the higher degrees, I can state that such a statement is utterly untrue, the beautiful ritual and symbolism of the Christian Orders being calculated to make a deep impression upon the candidate.

In conclusion, Freemasonry needs no defenders, it fears no Jesuit animus, or ignorant abuse; it numbers in its ranks the best and wisest of our land—noblemen, judges, statesmen, and clergymen; indeed, many of the latter take so much interest in it (and Wesleyan ministers also) that it is absurd to find fault on religious grounds; and it is said of one who has departed this life so recently, and so much mourned—President Garfield—that he was an earnest worker in the Craft.—I am, &c.,

KNIGHT TEMPLAR.

FREE PROFESSIONAL SERVICES.

SIR,—I beg to inclose a cutting from the *Freemason's Journal* of this date, reporting a meeting of the General Committee of the National Exhibition of 1882, in which it states that "Messrs. Deane and Sons, architects, wrote, intimating their willingness to give their gratuitous professional services to the Committee, which were accepted with thanks."

Perhaps some of your readers can inform me whether any members of the above firm are Fellows of the R.I.B.A., and also whether it is customary for architects to offer "their gratuitous professional services" in this manner?—I am, &c.,

JOHN L. ROBINSON.

198, Great Brunswick-street, Dublin.

October 8.

P. S.—If the report inclosed be inaccurate, it is only fair to the above-mentioned firm to give them an opportunity of correcting the error in your column.

A MONSTER PAVING-SLAB QUARRIED IN THE UNITED STATES.

SIR,—In your issue of the 16th ult., you refer to a large slab quarried and worked by our American friends.

It may not be generally known to your readers that in this "tight little Island," we can, and do, get many large paving-slabs, and other, I may say, "monster" stones—a few of which, with your permission, I will name, premising that architects and users of large stones would find both pleasure and profit in visiting the quarries for themselves where they can be seen.

Long Steps.—Craigleith steps, over 20ft. long, were delivered at the Natural History Museum, South Kensington, from the Craigleith quarries, near Edinburgh.

Scotgate.—A half space slab or landing 17ft. 6in. by 7ft. by 10in., was delivered and fixed at the London and County Bank, Lombard-street, from the Scotgate quarries, and in the same quarries there is, at the present time, a slab 32ft. by 9ft., and one 28ft. by 7ft., also a block just cut, 18ft. by 8ft. by 3ft.

At Styperstone, near Macclesfield, and at Brechin, near Montrose, Scotland, very large slabs can be got. The Brechin stone is similar in colour and texture to the Wallace-bridge stone, Nova Scotia.

At Annan, blocks 20 to 30 tons could be got if required.

At Hayshaw Moor, near Pateley-bridge, Yorkshire, a monster block is, at the present time, being cut up for the Hull and Barnsley Dock and Railway Works, 120ft. by 20ft. by 10ft., or near two thousand tons, and near to this is another very little less, of a pure white colour.

Granite.—If we speak of granite at Blacksod Bay, Ireland, enormously large blocks and slabs can be raised.

At Penryn, Cornwall, Messrs. John Freeman and Sons have a granite block now ready to be

cut up, 40ft. by 30ft. by 15ft., or nearly 1,500 tons.

At the De Lank quarries, blocks 130ft. by 10ft. by 12ft. (nearly 1,300 tons) could be got if required.

I might mention other quarries were very large stones can be had, such as Darley Dale, Grinshill, Castle Whelan, Foynes, &c., but the above will suffice.—I am, &c.,

SAMUEL TRICKETT.

DUBLIN MUSEUM COMPANY.

SIR,—As a competitor, I cannot agree with "An Architect," who writes, in your last issue, that an extension of time is necessary. I do not know when the first advertisement appeared, but I had at least seven weeks' notice; and if an architect cannot, in that time, make sketch-designs to a sixteenth scale, it must either be on account of pressure of work, for which he should be thankful, or on account of lack of knowledge, which should prevent his entering the competition at all.

There are other points, however, in which the instructions might be amended. They say that there shall be only two drawings on each strainer. Now it seems to me absurd that an elevation or section which cannot be higher than $\frac{1}{4}$ or 5in., if the competitor makes a design which can be executed for the money, shall be compelled to occupy the same space as a plan which is over 12in. in its smallest dimension. I wish to ask you, Sir, whether you think a contravention of the instructions in this particular would put my design *hors de combat*?

If "An Architect" will add this reform to his, he shall have my help in getting an extension of time.—I am, &c.,

C. P. E.

ARCHITECTURAL MUSEUM PRIZE DRAWINGS.

SIR,—In your issue of the 7th inst., a slight error occurs in the description of the prize drawings at the Royal Architectural Museum, when you state that there is a "view of the notable tower of 'Maiden Erlegh, near Reading,'" &c.; it should have been the tower of "Mortham, near Rokeby, Yorkshire."

I write this because it might mislead people who think that Maiden Erlegh has a tower.—I am, &c.,

GEO. W. WARD.

Carisbrooke Villa, Cowper-road, Acton, Oct. 12.

CHIPS.

The famous Bierens collection is to be broken up. It will be sold at Amsterdam about the middle of November. Like the Van Loon collection, which was bought *en bloc* by the Rothschild family about four years ago, the Bierens collection has the distinction of having been formed in the lifetime of the great Dutch artists of whose works it consists.

On Monday the vicar of Wakefield laid the memorial-stone of a clergy vestry which is now in course of erection at the north-east corner of that church. The new erection will cost 1,000 guineas. It includes entrance-lobby, lavatory, and vestry, the dimensions of which are 22ft. by 17ft. The plans have been prepared by Mr. W. Watson, architect, Wakefield (an ex-churchwarden); Mr. G. Fawcett (one of the churchwardens) is executing the brick and stonework, Councillor Culbert the plumbing and glazing, and Messrs. Craven and Lloyd the woodwork.

A special committee of the Andover town council reported to the latter body, last week, in favour of the adoption of a system of deodorisation and precipitation similar to that in use at Taunton. The consideration of the report was adjourned for a month.

The death is announced of Friedrich Hitzig, president of the Berlin Academy of Arts, and one of the most distinguished municipal architects in Germany, great part of the fashionable West-end streets in the Prussian capital being from his designs. The Bourse and the Imperial Bank, both handsome buildings, were among his works. The deceased was the son of the celebrated Edward Hitzig, who edited the "New Pitaval."

A tower and spire are being added to the parish-church of Ryde, Isle of Wight. Mr. Barton is the contractor.

The Broadstairs local board received on Wednesday week a report from their surveyor on the five sets of plans for drainage recently sent in in competition. He stated that having examined the plans, he could not recommend the adoption of any one of them.

Intercommunication.

QUESTIONS.

[6707.]—**Softening Putty.**—What is the necessary process for softening top and bottom putty in a greenhouse roof, so that the glass may be taken out without breaking?—A. STRECHER.

[6708.]—**Plumbers' Solder and Smudge.**—Would any of the readers of your valuable paper give me some hints as to the making of plumber's solder and smudge, and they will kindly oblige—A. YOUNG PLUMBER.

[6709.]—**Rainfall, Sewage, &c.**—Please give names of reliable works on these subjects, more especially with regard to average amounts of rainfall, dimensions of sewers to receive same, and stormwater, floods, &c.—P.

[6710.]—**Washable Water-Colour.**—Could any architect give me any information respecting a patent washable water-colour for interior decoration, instead of distemper or oil paint for walls and ceilings? I believe it is called calcarium, and is manufactured at Bristol. Will it answer well upon new plastered walls, which are fairly dry? A client of mine is anxious to introduce it, if I can recommend it.—LASCARRE.

[6711.]—**Houses of Call.**—I have noticed over the doors of different public houses "House of call for Plumbers," "House of call for Plasterers," and the like. Could any reader say where or how I could get a list of the "houses of call" for the different building trades?—W. J. H.

[6712.]—**Breaking Weight of Cast Iron Stanchions.**—I shall be obliged if Hugh McLachlan or some other contributor will state in a simple manner the method of calculating the breaking weight of cast iron stanchions. Take, for example, one 10in. by 5in., 11 shape, of 1 1/2 in. metal. The formula given in Hurst is so intricate.—INEXPERIENCED.

[6713.]—**Shoring.**—Will some friend kindly mention some good book, pamphlet, or other authority on shoring and underpinning? I wish to know what dangers are likely, and what principles to follow.—W. G. M.

[6714.]—**Gas-Tar and Shingle Paths.**—I should be glad if any correspondent would give a good recipe for making gas-tar and shingle pathways.—S. F. C.

[6715.]—**Varnishing Exterior Woodwork.**—Having a dislike to using paint on wood work as being more or less a sham, and serving to hide the natural beauties of the grain, I invariably have all internal woodwork varnished, but when I wish to have external work treated in the same way, I am met with the assertion that it blisters with the heat of the sun, and will not stand the weather. Will some professional correspondent kindly give me the benefit of his experience on the subject, and state if there is any kind of varnish that will stand both heat and weather?—LONDONER.

[6716.]—**Examination Question.**—The following question was given in Advanced Building Construction last May, Science and Art Exam. Skeleton diagram of a roof-truss thus over an

open shed 35ft. wide. All the members in tension are to be of round iron, and the remainder of timber. Give detail drawings to a scale of full size of the joints at the head and foot of the king rod, assuming dimensions for the different parts. In that case I take the horizontal member to be in tension, so I call it a tie rod, but how am I to fix the wood struts on it, and what is the rule to determine the sizes of the different members? In this case the rafters and struts would be of wood, the rest of iron.—STUDENT.

[6717.]—**Mounting Drawings.**—What is the best method of mounting drawings on stretchers with calico backs?—G. P. B., SUBSCRIBER.

[6718.]—**Back Pointing in Tiling.**—Information is requested as to whether inside or outside pointing is properly called back pointing, since the backs of the tiles only are exposed to the weather.—FIX.

[6719.]—**Specifying Painters' Work.**—I want to specify for painting the exterior of a house. The work to be painted is in stucco, and in parts in very bad condition. What is the best kind of paint to use? How many coats, and should the old paint be removed? How soon could the parts repaired in stucco work be painted upon?—E. G.

[6720.]—**Admiralty Clerks of Works.**—Will some one please inform me how clerks of works on east-guard and other Admiralty building works are appointed? If by competitive examination or otherwise.—G.

[6721.]—**Colouring Portland Cement Front.**—I want to colour down a newly Portland cemented front. Will some one kindly say best means of getting a good light bluish colour, which will stand well?—G. P. B., SUBSCRIBER.

[6722.]—**Painters' Work.**—What is the correct method of measuring the painting of a greenhouse or conservatory, inside and out?—O.

[6723.]—**Separate Cistern to W.C.**—Why should a w.c. have a separate cistern when the service pipe stands always charged? How can the water in cistern in such a case become contaminated any more than if the service pipe supplied a tap over a dirty sink?—O.

[6724.]—**Seats for Lecture Hall.**—Which is the best arrangement for seats in a lecture hall, and why?—H. D.

[6725.]—**Draughts.**—What is the cause of the down draughts frequently proceeding from large glass surfaces? How can they be remedied?—H. D.

[6726.]—**Girder.**—In a lattice girder as sketched,

which part would be in compression, and which in tension, if the girder was uniformly loaded, and which brace would bear the greatest strain? How is it arrived at?—H. D.

[6727.]—**Window Lights.**—I think I have seen it stated that twelve years' uninterrupted use will now give the right to light instead of 20 years' as formerly. Is this correct?—S. W.

[6728.]—**Drainage of Towns.**—The title and price of the best book describing the several methods in use, with reference to actual working examples, would much oblige—W. S.

REPLIES.

[6619.]—**Roof.**—According to promise of last week I send further particulars. The diagrams A B C and D

[It will be seen that a tensile strain of 3 tons is acting at the feet of principals; this will be resisted by the wall, which if of brickwork in mortar, is 3ft. thick at trusses; and in cement, of 11t. 1 1/2 in.]

show four different trusses of same pitch and span as the one given in question. The first two have tie beams carried across from feet of principals, whilst C and D have the height raised in centre, supposing that to be wished by "D" miss. The thick lines show pieces in compression, and the thin lines those in tension. I have calculated for trusses placed as much as 10ft. apart, that being nearer the distance generally required for roofs of construction shown in question. Calculating the load on roof at 52wt. per square of 100ft. (answer last week slightly inaccurate), the total load on one side of truss would be 6tons 15lb. 5wt. Assuming three principals to rest on each side of trusses equally spaced between ridge and wall-plates, they would distribute loads over the several joints of principals as figured horizontally over the line on the diagrams. Really the ridge would not bear quite so much, as a strong wind could not bear on the

two sides of roof at the same time, but the excess of strength is not worth noticing. All loads are figured for tons and decimals of tons. The strains on the several pieces have been found from the above calculations and by the "Graphic method" referred to in a later answer. All strains are figured in the direction of the pieces which are subjected to those strains; the principals, tie-beams, and collars are also subjected to a transverse strain, which in long tie-beams must be taken into account. Of the four I prefer B and C, both on structural and artistic grounds; the first might have the struts slightly curved or be filled in with tracied boarding, the heads of tracery to be pointed towards principals in the longer compartments, the latter is the one I referred to last week with more braces between wall-struts, principals, and walls. It will be seen that in the last the heads of the principals and king-rod are subjected to the greatest strains, this being different to the other roofs. This follows from the main ties being connected to heads of principals, the weakest point would be the junction of the ties; further, what many would consider as queen-posts become struts, and throw a great strain on the upper part of the principals. This roof would be more expensive than the others, and always be subjected to great strains. The small horizontal tie and wall pieces as shown in the roof by Dennis are worse than useless, they would even do harm. Cross-braces are in all cases both in tension and compression. The steeper the pitch of roof, the less is the strain on the principal timbers, though the total load is actually greater.—HUGH McLACHLAN.

[6666.]—**Painting.**—First coat the object to be painted with Chinese white, then proceed as you would on paper.—THOS. R. DAY.

[6674.]—**Roof Strains.**—Owing to a misprint, "pp. 134 and 205" in the sixth line should be read "pp. 104 and 105." I expect the answer No. 6619 referred to therein will be printed this week, the diagrams having made it too late for last.—HUGH McLACHLAN.

[6677.]—**Cemetery Lodge.**—In many cases the first part of the service is read at some neighbouring church or chapel before proceeding to the cemetery, after which the coffin is replaced in the hearse, which is driven through the gate as near to the grave as possible. The Committee may also have in view the future erection of a chapel in the grounds. For these reasons it may be advisable to raise the entrance gateway to allow for the passage of a hearse as desired. Mr. Tarrer has previously pointed out that the gateway cannot properly be called a "lych gate," unless a table is placed under it on which the coffin should be deposited. The word "lych" means a corpse and is the same as the first syllable in the German word Leichnam which has the same meaning. It is the duty of an architect to carry out the instructions of a client, even if absurd, which they do not appear in this case, unless in doing it he may bring discredit upon himself.—HUGH McLACHLAN.

[6678.]—**O-Traps.**—If "Enquirer" will furnish me with one of the traps he mentions, I will do my best to test it with those I have in hand.—DANIEL EMBAGE, Dane-hill Sanitary Works, Margate.

[6679.]—**The White House at Washington.**—In Fenimore Cooper's work, "America and the Americans," published in 1836, I find the statement that the Capitol "is of a light greyish freestone, and it has been found necessary to paint it white in order to conceal the marks of the smoke left by the configuration of 1814." "The President's house," he continues, "is a neat, chaste building of the Ionic order, built of the same material, and painted like the Capitol. It stands in a public square, and in a considerable garden, and is 170ft. in length by 85 in breadth." This would make it just about the size, although entirely different in appearance, of Baron Grant's late mansion in London, Kensington House, or of Holford House, Regent's-park. A sketch of the White House appeared in the Graphic of 18 Nov., 1876.—H. Y. POWELL.

[6679.]—**The White House.**—The whitewash used for this building at Washington was made thus: 11 lb of a bushel of unslaked lime, slake it with boiling water, covering it during the process to keep in the steam. Strain through a fine sieve. Add a peck of clean salt, previously dissolved in warm water; three pounds of good rice ground to a thin paste, and stirred in while boiling hot. Half a pound of powdered Spanish whiting, and a pound of clean glue, which has been duly soaked and melted. Add five gallons of hot water. Stir it well and let it stand for a few days covered up; keep out dust, &c. It should be used quite hot. One pint is said to cover a square yard upon the outside of a house. It retains its brilliancy for years. Taken from the "Handbook of the Mechanical Arts."—H. O. W.

[6682.]—**Printed Reports in Competitions.**—In acknowledging reply to above by Mr. Bell, I think he has failed in giving the desired information. What I would like to know is: first, the conditions merely stating that a report was to be submitted along with the plans, and leaving it to the competitors either to furnish printed copies or otherwise as they thought fit—can my action in submitting printed copies be termed unjust? Of course, it lay with the committee to decide whether or not they should be distributed; and, second, should competitors only submit printed copies of report when such is specially mentioned in conditions? I know several architects of position who never compete but what their reports are printed, and this seems a course pretty generally adopted. I may state that in the competition referred to the remuneration did not affect the decision.—ENQUIRER.

[682.]—**Printed Reports in Competitions.**—"Enquirer" would have done better if he had left out the last clause in his question, it evidently shows that he feels himself very much hurt, the former part is right enough and much more sensible than many of the questions to be found in the "Intercommunication" column. Personally I would object to printed reports, unless each competitor is distinctly asked to submit them, though I agree that they are a help to members of committee and the press. If for no other reason I would urge this, keep down as much as possible the expenses of competitions, otherwise an advantage is given to the richer competitor. In a recent competition I was asked to enter in with a few other architects, I believe the successful one owed his success to having laid out more money than any of

his fellow competitors in perspectives: of course there was no professional referee. The late resolutions at the conference of British Architects in May last were a decided step in the right direction. No right-minded competitor should send in a report or any other written communication in his own hand writing if he thinks it can give a clue to his identity in any way; it is in fact sometimes forbidden. Mr. Bell's remarks as to committees and architects who are "black sheep" are rather unfair, though sometimes they will apply.—HUGH McLACHLAN.

[6684].—**Figures of Saints, &c.**—I believe there is a descriptive list in Gwilt's "Encyclopedia of Architecture," though not illustrated. In this I am trusting to memory alone. Illustrations are not very important, the emblems being what is wanted; they may be used with slight variations of positions.—HUGH McLACHLAN.

[6685].—**Variation of Compass.**—During the past few days I have been trying to find out this for a county in the north of Scotland, and shall be glad if some reader will explain how the variation can be calculated for different localities. Books which I have searched are somewhat perplexing. Cassell's "Popular Educator," Vol. VI., page 321, gives the "variations in England" as "about 21 points to westward of north." This is upwards of 25°. In a science textbook on Magnetism and Electricity I find the variation in London given as "about 20°" to west. Ogilvie's "Imperial Dictionary" says that in 1580 the variation in London "was 11° 15' east; in 1663, the needle pointed north, since which time it has travelled about 24° to the westward, and now (1850) it has begun to retire." Being unable to get any satisfactory information from books, I took an observation from the Pole Star the other night, and made out that here the variation is about 23° to west. I set up a pole in a straight line for the star from the corner of a tall building, and found that my compass varied to the above extent from this line. Failing precise information, P. Playfair may try this method, but it is somewhat difficult to work exactly without special instruments, and I shall be glad to be told if I am nearly correct.—L. L. U.

[6687].—**Chimney Shaft.**—Write to "The Superintending Architect" of the named corporate body. There are some recent byelaws, but I do not think they give the information desired. Drawings would have to be submitted to the District Surveyor for approval.—HUGH McLACHLAN.

[6697].—**Zinc Soakers** are used in the same way as lead soakers. They are about 9in. wide, and the length should correspond with the gauge and lap of the slates. One soaker to each slate, and turned up the wall as flashing with overflashing.—FRZD.

[6697].—**Zinc Soakers.**—These are usually cut about 6in. or 8in. wide, and the length of gauge of slates used plus the lap. One edge is then turned up 2in., and tacked to the joints of abutting wall. When slating is completed a lead flashing is put on in the usual manner; but instead of laying on the slates it is cut off in the angle. If properly done it is quite effectual.—O.

[6703].—**Boundary.**—"Accuracy" can build up to his line, but as regards eaves, a frequent puzzle in such cases, he can overhang and risk trouble and expense of altering. Keep them flush, very ugly, or either put a parapet or set off the wall near the top so as to gain room for eaves. Sometimes a few inches are left for eave, but unsightly spaces are thus left in the street.—O.

[6706].—**Shingles.**—Oak shingles for spire, &c., may be of any length from 14in. to 9in., and from 3in. to 5in. wide, the thickness tapering from 3in. to 2in. The width at top should be 3in. less than at bottom. The hips are worked the same as tiles.—FRZD.

CHIPS.

New schools attached to the Union Chapel, Grendon, near Northampton, were opened last week. They have been erected at a cost of £180 by Mr. James Underwood, builder.

The town council of Hereford passed, last week, a resolution expressing the regret with which they had heard of the death of Mr. George Coles, who for upwards of 22 years has held the appointment of city surveyor. It was resolved to offer Mr. Coles's successor the same salary as was recently paid—£250 a year.

Plans by Mr. W. Talbot Brown, of Wellingborough, were adopted last week for a Conservative club proposed to be erected in the High-street of that town.

The town council of Penrith received last week the offer of the valuable geological collection of the late Admiral Wauchope, which will be freely presented to the town on condition that it be made the nucleus of a public museum and library. The proposal was referred to a committee for consideration.

The window in the south aisle of the chancel of St. Mary's Church, Bury St. Edmund's, erected by the Queen in memory of Mary Tudor, was unveiled on Tuesday last; it was executed by Messrs. Clayton and Bell. Another stained-glass window, the sixth in the series, has just been erected in the same aisle, by Messrs. Heaton, Butler, and Bayne; it is of three lights, each occupied with two incidents in the lives of Samuel, David, and Solomon.

The Sudbury Archdeaconry Church Building Society, at its annual meeting, held at Bury St. Edmund's on Wednesday week, granted £20 towards the restoration of Bildeston church, £25 towards that of All Saints, Sudbury, £10 to Worlington church, and £10 to that at Pakenham, the latter for roof repairs. £25, being half the grant, had been paid in the case of Clare church.

LEGAL INTELLIGENCE.

"EXTRAORDINARY" TRAFFIC ON ROADS.—At the Gloucester county petty sessions, Mr. A. Estcourt, builder, of Gloucester, was summoned for £41 13s. 4d., being the expenses of repairing the Gloucester and Birdlip-road, which was alleged to have been damaged by extraordinary traffic on the part of defendant between Sept. 20th, 1880, and March 25th last. Defendant was the contractor for the erection of the Barnwood county asylum, and Mr. Drinkwater, surveyor to the highway board, proved that he had given orders for 300 additional loads of material to be placed on the Birdlip-road, in consequence of the extra traffic occasioned by defendant's carts. He also stated that the annual expenditure, which was generally about £277, rose last year to £400. The defendant was charged with the cost of obtaining and laying 100 tons. For the highway board, the complainants, it was argued that in March, 1880, Mr. Justice Lush interpreted the law to mean that those who made an excessive use of the highway, thereby increasing the cost of repairs, ought to bear a proportion of the expense. For the defence it was contended that complainants had to prove "extraordinary traffic," and the amount of damage which the extraordinary traffic did; and, in either case, it was urged, they had failed. The road was an important one, that from London into Wales, and they had not alleged that the weight of any particular load was excessive; whereas, they were bound to prove excessive weight. Building was, moreover, a recognised trade in the neighbourhood, and judges had ruled that highway authorities were bound, in making their roads, to have regard to the local industries. Mr. Justice Grove, it was shown, had laid it down that "extraordinary" traffic did not refer to the amount of user. Mr. Justice Lindley, in *Wellington v. Hoskins*, had said the question was, not what was the aggregate amount carried, but under what conditions was it carried, and how was the amount distributed? Moreover, in *Williams v. Davis*, Williams appellant, it had recently been declared that the use of a road for timber-hauling was legitimate. The magistrates held consultation, and on their return, Sir W. V. Guise said an unusual amount of material might have passed over the road, but the road was for all her Majesty's subjects, and the magistrates could not see that there had been any extraordinary traffic. The summons would, therefore, be dismissed.

STATUES, MEMORIALS, &c.

GENERAL SIR FREDERICK ROBERTS.—The bust of General Roberts, executed by Mr. Henry Harvey, was presented to Lady Roberts by Dr. Zeifli at the artist's studio, on Thursday week. General and Lady Roberts expressed themselves much gratified with the work.

STAINED GLASS.

BOXLEY.—The south-west window in the nave of Boxley parish-church, Kent, has been filled with painted glass by Messrs. Hardman and Co., of Birmingham and London, to the memory of the late vicar. The window has two lights. The subject depicted in that on the left hand is Our Lord with St. John in one boat, and St. James and Peter in another, fishing. The right-hand light represents St. Peter and John in the act of curing the lame man at the Beautiful Gate of the Temple. The upper tracery is filled in with the emblems of the two apostles, St. Peter and John.

ASTON.—There have been recently added to the church of St. Silas, Aston, near Birmingham, five stained-glass windows, which were designed and executed by Messrs. Camm Brothers, of Smethwick, near Birmingham. The subjects are coloured on grisaille ground, and are as follows—viz., St. James; St. John the Baptist; Christ feeding the Multitude; Charity of Dorcas; and the Good Samaritan.

TRIANGLE, HALIFAX.—During the past week three new stained-glass windows have been placed in the nave of St. John the Divine's Church, Triangle. They represent "Christ the Consoler"; "The Vision of the New Jerusalem"; and "The Redeemed in Heaven." In the first window Our Lord is depicted surrounded with the weary and heavy-laden, who are coming to Him for consolation. In the second, the angel and St. John are seen in the foreground; in the background is "the holy Jerusalem, descending out of Heaven from God." In the third window there are three groups of figures, representing the blessed in Heaven. In the first light are members of the three orders of the ministry, bishops, priests and deacons; in the next light there are angels; in the third, a typical group of old men, women, young men, maidens, and children. All these windows have been supplied by Messrs. Heaton, Butler, and Bayne, of London.

WATER SUPPLY AND SANITARY MATTERS.

THE DRAINAGE OF THE LOWER THAMES VALLEY.—At a meeting of the Lower Thames Valley Main Sewerage Board, recently held at Kingston, and presided over by Sir Thomas Nelson, a letter was read from the Local Government Board acknowledging the receipt of a copy of a resolution passed by the Joint Board with regard to the terms upon which the West Kent Main Sewerage Board were willing to arrange for the discharge into their sewers of sewage from the Lower Thames Valley district, and stating that the Board much regretted to learn that the last proposals of the West Kent Board were such that the Joint Board had felt themselves unable to agree to them. At the same time the Board could not but consider that under the circumstances surrounding the case the difficulties would best be met by an arrangement which would admit of the discharge of the sewage of the district into the West Kent system, and they asked whether steps might not be taken to bring about a conference between the two authorities with the view of reverting to the original proposal. The Board would afford every assistance in their power towards promoting such a conference, and they would be prepared to instruct one of their inspectors to attend it if his presence should be deemed desirable. In the course of a long discussion it was explained that the Board had already adopted a separate scheme of Mr. Hawksley's, and it was ultimately resolved by a large majority "That the West Kent scheme not being at present an assured success, and this Board having no knowledge of and being incapable of foreseeing the possible and probable results that may accrue from the construction thereof, are of opinion that it is not desirable to further consider the matter, having no guarantee that such a combination will prove either economical, efficient, or final." It was stated by the chairman that the time was very shortly coming when they would have sat there four years, and the only result they had to show for it was an unfortunate expenditure of a very large sum of money, which had absolutely resulted in nothing.

CHIPS.

The new line of railway from a junction with South-Eastern system at Appledore to Lydd, near Dungeness, was officially opened on Monday by General Hutchinson and Col. Yolland, C.B., the inspectors to the Board of Trade. Messrs. Walker and Sons were the contractors for the line, which will probably be opened in about a fortnight's time.

The foundation-stone of the Bennett memorial church was laid at Bournemouth on Tuesday by the Bishop of Winchester.

A permanent church of St. Luke is about to be built on the Redlands estate, Reading. The architect is Mr. J. Piers St. Aubyn, of London.

It is announced that Major-General C. W. Hutchinson, R.E., is about to vacate his appointment as Inspector-General of Military Works in India, and that he will be succeeded by Major-General R. Cadell, R.E.

Chaddleworth Church, Berks, was reopened last week after partial restoration, including rebenching, reflooring in nave, and rebuilding of south porch. Mr. Ewan Christian, of Whitehall, S.W., was the architect, and Mr. Aldridge, of Hannay, the builder.

A man named Brettell, in the employ of Messrs. Kellet and Bectley, the builders and contractors who are now erecting a viaduct at Stourbridge, has been remanded in custody on a charge of fraudulent conversion of £100 belonging to his employers.

Mr. Charles Baker, of Croxton, was last week elected road surveyor to the town council of Thetford, in the stead of Mr. H. Burke, resigned.

Extensive alterations and improvements are being carried out in the Christian Union Buildings, Dublin. The basement has been entirely remodelled, and a large hall, seating 1,800 persons, formed out of many small rooms, while in the great hall an orchestra has been provided behind the platform, which has been brought forward. Mr. Alfred G. Jones is the architect, and Messrs. Beckett, of South King-street, Dublin, are the contractors.

The ancient church of Combe, Hants, was reopened on Thursday week by the Bishop of Winchester, after restoration.

An extension of tramways, from Clifton-street, Cardiff, to Grangetown, was officially inspected by General Hutchinson on Tuesday. The line is 2½ miles in length; Mr. W. S. Yockney was the engineer, and the work has been carried out under the personal superintendence of Mr. T. R. Ward, resident engineer, by the contractors, Messrs. Jones and Jepson.

Our Office Table.

THE utilisation of canal courses as the line of route for railways is not quite a new idea. Many years ago there was a great deal of speculation as to whether the Kennet and Avon Canal, now the property of the Great Western Railway Company, might not be drained of its water and converted to some such purpose. No such scheme, however, was ever carried out. The Hereford and Gloucester Canal between Ledbury and Newent has recently been emptied, and is now being laid with rails as a Great Western extension. A plan is now under consideration by which the Regent's Canal would become a means of railway communication between the east and west of London. It is said on good authority that the Great Western Company will support an application to Parliament next session for authority to form a railway on the bed of the canal, and that the proposed new line will run from Poplar to Paddington.

At the last meeting of the City Court of Common Council, Mr. Tomkins asked the permission of the Court to withdraw his motion—"That the City Lands Committee be instructed to remove the damaged plaster-work of the Temple Bar Memorial, and to substitute plain panels pending the completion of the bronze castings," as the chairman and the architect had anticipated it to some extent. He wanted an assurance, however, that it was their intention to remove the whole of the plaster-work from the panels, and this was given him by Mr. Day. Why not let the plain spaces for advertisements? Good posters designed in the same style as the Griffin would really rather improve the "Memorial," and the revenue derived from their exhibition would help to pay the policemen.

On Sunday last one of the largest fires which has occurred of late years in Bristol, caused a serious archaeological loss, the well-known Canynges apartments, so long objects of antiquarian interest, having been involved in the ruin of the premises. The apartments were the only remnant of the great house in which the second William Canynges, the builder of Redcliff Church, described by Chatterton as the "pride of Bristowe and the Western lande," once lived. Of the hall and oratory of the ancient mansion, though sundry alterations had been made to fit them for the purposes of Messrs. Jefferies's business, yet sufficient remained to bear testimony to the ancient grandeur. The carved timber roof was well-nigh perfect, and the carved corbels were still in a good state of preservation. Behind this hall was a printing-office, in which traditional Canynges feasted King Edward IV., and in another portion of the building was a room fitted up in the style of architecture prevailing in the latter part of the 17th century. There was in this apartment, which was known as Canynges's Parlour, a highly ornamental Renaissance fireplace and richly-carved furniture.

The plans of the proposed new Tay Viaduct are now being exhibited in the North British Railway offices at Edinburgh. The plans have been prepared by Mr. W. H. Barlow, and are made for a double line of rails. The bridge, which is on the girder principle, will be about two miles in length, and will commence on the south, or Rife side of the Tay, about 60ft. west of the former structure. With the exception of the brick arches at the commencement of the south side the piers will be of wrought iron pillars braced together, and encased in iron plates of from three-eighths to seven sixteenths of an inch in thickness. Every effort has been made to give effect to the recommendations of the special commission on the Tay Bridge question, with a view to securing the absolute security of the structure. The navigable spans in the centre of the bridge are to give a clear headway of 77ft. above high-water mark, being 11ft. lower than the maximum height of the former structure. A windguard 5ft. high will extend the whole length of the bridge.

In a letter to yesterday's *Times*, Mr. E. P. Loftus Brock, F.S.A., the hon. secretary of the British Archaeological Association, draws attention to the fact that the churches of East Anglia are generally unprovided with lightning-conductors, and that as a consequence of this, coupled with their conspicuous positions on hills, and the large

and lofty towers of these churches, damage and destruction by lightning has been frequent, the list beginning in old times and ending with the fine Perpendicular church of Wells-by-the-Sea, burnt in 1879. Only a short time since, South Wootton Church, also in Norfolk, was greatly injured by lightning, but it has not been stated whether it was provided with a conductor. Mr. Loftus Brock deems this a matter demanding attention, both in the interests of the Church and of the antiquarian value of these buildings, and says the danger may be avoided at a very moderate outlay. In cases of new churches, or where a grant has been obtained from the Church Building Societies, this danger is reduced to its minimum, since a lightning-conductor is made a condition. In cases of old churches, no such pressure can be brought to bear, but the writer suggests that it is a matter well within the province of archdeacons, or failing this, some higher ecclesiastical authority might issue a commission for the collection of evidence in the first instance, and for the adoption of means of safety afterwards.

MEMBERS of the House of Commons will find the arrangements made for their private convenience materially improved when they re-assemble. The clerk of the works and contractors have well-nigh completed the conversion of the two committee rooms given up by the Peers to be used as dining- and tea-rooms by the Commons, and they are also carrying out alterations in detail which will put an end to many inconveniences. The new smoking-room will not be provided during this recess. The room the Lords have given up is occupied during term by the judges of the Court of Appeal, and their lordships' removal to the new building in the Strand must precede this addition to the conveniences of the Lower House. On the other hand, the committee rooms which the Commons have given up to the Lords are being connected to their lordships' house, and a new staircase and corridors have been formed, which afford access to them.

CHIPS.

A vestry meeting was held on Thursday week in St. Swithin's parish, Norwich, to hear a report by Mr. R. M. Phipson, diocesan architect, as to the condition of the church tower, which stated that the upper part is in a dangerous condition, and recommended that a story should be removed and a light wooden cover put over the bells. The whole church (which faces Princes'-street chapel) was, indeed, in so bad a condition that he would almost suggest that the parish be amalgamated with a neighbouring one, and the fabric dilapidated. It was resolved to apply to the town council to grant funds for removing the tower and throwing the site into the street.

The Portsmouth town council have adopted a committee's report in favour of erecting a new Custom-house at an estimated cost of £5,000.

A new section of tramways in Northampton, extending from All Saints' Church, the Draperies, in the centre of the town, to the Roman Catholic Cathedral, Kingthorpe-road, was formally inspected by General Hutchinson, R.E., of the Board of Trade, on Friday. It has been constructed from plans by Mr. S. Floyd, C.E., engineer to the Northampton Tramcar Co., under the superintendence of Mr. E. P. Binet, resident engineer. Messrs. Meston and Son were the contractors.

Mr. J. E. Millais, R.A., has been nominated as a foreign associate of the Paris Academy of Fine Arts, in the room of the late Herr Stracke, of Berlin.

Dissatisfied with the treatment he has recently experienced, Mr. George Hodson has resigned the position of surveyor to the Loughborough local board, which he has held for fifteen years.

The partnerships between Wills and Voisey and Voisey and Wills, Bristol, architects; Lloyd and Rose, London-wall, E.C., architects; Hook and Oldrey, Cowley-wharf and Pressland-yard, Kensal-road, W., builders; W. Watson and Son, Liverpool, builders; and Young and Summers, Woodford, Essex, builders, have been dissolved.

The town-council of Cheltenham have reduced the salary of the manager of the Corporation waterworks from £600 to £100 a year. The former salary was by the agreement of purchase guaranteed for three years, a term which has just expired.

A section of street tramways about a mile in length, extending from the High-street to Carmarthen-road, has just been completed at Swansea, under the supervision of Mr. Everingham.

In the annual statement made by the Chairman of the London School Board last week, it was mentioned that during the past year 25 new schools, accommodating 25,903 children, were built, bringing up the total accommodation within the board's district to 236,024 school-places.

The Islington Board of Guardians recently received tenders for adding a story to a children's ward at the workhouse. These proved considerably higher than the estimate, £275, and it was therefore decided to carry out the work without a contractor. At the meeting of the board on the 6th inst., it was reported by the visiting committee that the cost had proved to be under-estimated, and would probably be about £475, but for that sum greater accommodation would be provided.

A Freemasons' hall is about to be erected at Fowey, from the plans of Mr. A. S. Clunes. The tender of Mr. Smith, of St. Austell, has been accepted for the work, which will be carried out at once. The site adjoins the South Western Bank.

New Board Schools are about to be erected at Newburgh, Forevan, from the plans and designs of Messrs. Jenkins and Mare, architects, of Bridge-street, Aberdeen.

An organ, built by Messrs. Clark and Son, of Bath, was opened at Timbury Wesleyan chapel, near that city, last week.

The annual distribution of prizes in connection with the science and art classes at Ayr, took place on Saturday, at the town-hall of that borough. The reports presented were of a favourable character. That of the art classes stated that at the South Kensington examinations 2 third- and 11 second-grade prizes were obtained by local students, and 19 works earned the highest grant. At the May examinations 57 students were examined, and obtained 9 prizes and 38 pass-certificates.

The roof of St. Mary's Church, Billericay, Essex, having been found to be unsafe, a vestry meeting was held last week to consider the matter, when it was decided to call in Mr. E. L. Cutts, a London architect, to inspect the building and report.

The guarantee fund for the Central Northumberland Central Railway scheme having reached £8,000, the provisional committee have instructed Mr. W. Shelford, C.E., the engineer of the Hull and Bursley Railway, to make a survey and report on a line from Newcastle to the Tweed.

The town council of Burnley have decided to consider the question of the conversion of the markets, on which there has been a loss of £60,000, into a town-hall at a probable cost of £15,000.

The new lighthouse at Anvil Point, Dorset, inaugurated last week, stands on a cliff 140ft. high, and is, therefore, of but one story. It has been built of stone found on the spot, bedded in Portland cement. Mr. J. N. Douglas, engineer-in-chief to Trinity House, furnished the design, Mr. Arthur Ayres acted as assistant engineer, and the lantern, revolving lens, and clockwork were supplied by Messrs. Chance Brothers and Co., Birmingham.

Last week at the Rochdale town council meeting Mr. Samuel S. Platt, of Rochdale, was unanimously appointed to the office of surveyor, which had become vacant by Mr. Thomas Hewson having been elected lately as the surveyor of Leeds. Resolutions passed by several committees, testifying as to the ability of Mr. Hewson, and expressive of regret at his departure from Rochdale, were confirmed by the council.

The new R.C. church at Guildford is to be opened on the 19th inst. by Cardinal Manning. The completed portion of the structure (nave and sanctuary) will seat 200 adults. The south aisle and Lady-chapel remain to be added. The builders are Messrs. Mitchell Bros., of Shalford, and the architect Mr. E. Ingress Bell.

Memorial-stones of a new board-school have been laid on a site adjoining the Bowling-green, at Stainland, near Halifax. The architects are Messrs. Leeming and Leeming, of Halifax, and the clerk of works is Mr. Richard F. Farrer, from the same architects' office. The contractors are Messrs. Tayler and Hellwell, mas ns; Mr. A. Park, Stainland, carpenter and joiner; Mr. W. R. Crowther, Soward, plasterer and plater; Mr. J. Aspinall, Elland, plumber and glazier; and Mr. B. Townsend, Stainland, painter.

St. John's Chapel, Stonehaven, N.B., was reopened on Sunday, after alteration including the erection of new pulpit, choir-seats and platform, all of yellow pine and pitch-pine, and the removal of organ to a chamber, with vestry beneath, and the provision of new gas standards and fittings. Mr. John Watt was the architect, and the work was carried out by local tradesmen under contracts, that for masonry being taken by Messrs. Gregory, and that for carpentering by Mr. James Murray, jun.

The Liskeard rural sanitary authority adopted last week a scheme by Mr. Mallett, their sanitary inspector, for the improvement of gradients, trapping, and ventilation of the sewers in East Loe.

At the half-yearly meeting of the Gloucester and Bristol Diocesan Association, held at Bristol on Tuesday week, the following grants were made:—Churches: St. Paul's, Badminton, £60; Pilning, St. Peter's mission-room, £40; Blakeuey £35; Clifford's Mesne £100. Schools: St. Luke's, Cheltenham, £30; St. Mark's, Eiston, £30; Coleford, £60; All Saints', Gloucester, £25. Glebehouses: Shirehampton £100; Biddestone £20.

The Dean and Chapter of Lichfield announce that, in answer to their second appeal, promises of £2,700 have been received towards the restoration and repair of the west front of the cathedral, and a contract for the restoration of the upper part of the north-west tower has been entered upon, so as to enable the contractor to continue his work until next spring. This contract embraces the stage between the pinnacles and the stringcourse below the belfry. The further sum of £7,300 is required for the completion of the undertaking.

Sunnyside Baptist Chapel, Crawshawbooth, South Lancashire, was reopened last week, after having been painted and decorated by Mr. Cowpe, of Rawtenstall, and supplied with an organ built by Messrs. Griedrod and Co., Rochdale.

The London and North-western Railway goods station at Tamworth is being enlarged, and new sidings constructed, and an iron footbridge erected over the lines. The contract has been taken at about £8,000 by Mr. Evans, of Walsall.

The church of St. John the Evangelist, Irlans'-o'-th'-Height, Pendlebury, is about to be refitted, decorated in colour, and provided with stained-glass windows to nave, at the expense of Mr. O. Heywood.

The retiring mayor of Wolverhampton announced to the town-council, on Monday, his intention to present £500 as the nucleus of a fund for the purchase of specimens of art manufactures, to form a public museum.

The foundation-stones of the Bromley and Poplar Baptist Tabernacle were laid on Tuesday week. The building will be Byzantine in style, and will be constructed of brick, with Bath stone dressings. Accommodation will be provided for 366 persons at a cost of £3,500 only. Messrs. Spalding and Dixon are the architects, and Mr. W. Holland is the contractor.

The Prince of Wales opened on Wednesday the new sea-defence works at Hythe, Kent. They include a sea-wall about 6,000ft. in length, extending from Hythe to Sandgate, and a parade and road-way running the entire length, completing an uninterrupted low-level carriage-drive next the sea, from Hythe to Folkestone harbour. The wall is faced with large blocks of Kentish ragstone bedded in Portland cement, and is 8ft. in thickness at the base. Its depth is about 19ft., in some places 22ft., and it is calculated to resist any force of the sea that may be thrown against it. It has been constructed from the designs of Sir John Coode, and under the supervision of Mr. H. B. James, C.E. Mr. Good, of Hythe, was the contractor. The Prince afterwards laid the foundation-stone of the new deep-sea harbour at Folkestone. This will be formed by the extension of two large curved piers outside the present harbour: that to the west, close to the new Harbour railway station, will be 2,000ft. long, and that to the east will be carried along a natural reef from Copt Point to a length of 2,800ft. A water space of 100 acres will be inclosed in the harbour, which will have a low-water depth of 27ft., thus accommodating large steamboats. The enterprise will be carried out by the South Eastern Railway Company, from the plans and designs of Mr. Brady, their engineer.

Throat Irritation.—Soreness and dryness, tickling and irritation, inducing cough and affecting the voice. For these symptoms use Epps's Glycerine Jububes. Glycerine, in these agreeable confections, being in proximity to the glands at the moment they are excited by the act of sucking, becomes actively healing. Sold only in boxes, 7½d. and is 1½d. labelled "JAMES EPPS and Co., Homoeopathic Chemists, London." A letter received:—"Gentlemen,—It may, perhaps, interest you to know that, after an extended trial, I have found your Glycerine Jububes of considerable benefit (with or without medical treatment) in almost all forms of throat disease. They soothen and clear the voice.—Yours faithfully, GORDON HOLMES, L.R.C.P.E., Senior Physician to the Municipal Throat and Ear Infirmary."

Lamplough's Pyretic Saline is refreshing, most agreeable, and the preventive and curative of FEVERS, BILIOUSNESS, SMALLPOX, SKIN DISEASES, and many other ailments. Sold by chemists throughout the world, and the Maker, 113, Mulberry Hill. Use no substitute. See Medical Testimony.

Holloway's Ointment.—A Cure for All!—This invaluable Remedy, if we rubbed into the system, will reach any internal complaint. By this means it cures sores or ulcers in the throat, stomach, liver, spleen, or other parts. For bad legs, old wounds, sores, gout, rheumatism, and all skin diseases, it is unequalled.

Langmead and Way	1,017 0 0
Hatfield and Sons	960 0 0

LOUGHBOROUGH.—For supplying the board with 2000 tons of broken granite:—Ellis and Everard, X 8s. per ton at Loughborough Station; XX 8s. 6d. per ton at the station—Mountsorrel Granite Co., X 5s. 6d. and XX 6s. 6d. per ton at the station; at the Quarries X 4s. 6d. and XX 5s. 6d. per ton—Charnwood Granite Co., X 6s. 6d. and XX 7s. 2d. per ton delivered at Loughborough, where required for spreading; X 5s. and XX 5s. 6d. per ton at the Quarries—Eliza Cook, Loughborough, X 4s. 8d. and XX 5s. 8d., delivered at Loughborough Wharf—Robert Sh-rwin, Loughborough, X 4s. 8d. and XX 5s. 8d. at Loughborough Wharf. The tender of the Charnwood Granite Co. was accepted for 1,000 tons, and that of Mr. R. Sherwin for the remainder, providing that the latter would enter into a contract to supply stone of the same quality as the samples of the Mountsorrel granite before the board.

MARKET HARBOUR.—For construction of nine miles of earthenware pipe sewers from 6in. to 24in. diameter, for the Local Board. Mr. E. G. Mawbey, engineer, Corn Exchange, Market Harborough:—

Ottaway, Oxford	£21,135 0 0
Ward, Leicester	19,071 0 0
Noswell, London	18,056 0 0
Dovener, Burton-on-Trent	16,394 0 0
Rowles, Acton	15,829 0 0
Neave, London	15,829 0 0
Walker and Co., London	15,771 0 0
Hill Bros., Beckenham	15,712 0 0
McKenzie, Williams, and Co., London	15,471 0 0
Smith, London	15,245 0 0
Nelson and Co., York	15,000 0 0
Botterill, London	14,989 0 0
Palmer, Birmingham	14,718 0 0
Siddons and Sons, Oundle	14,689 0 0
Cordon, Nottingham	14,245 0 0
Fawkes, Bros., Southampton	14,070 0 0
Curral & Lewis, Birmingham	13,294 0 0
Hunter, London	13,665 0 0
Lt. Kidderminster	12,905 0 0
Barlow, Rothwell	12,891 0 0
Smart, Nottingham	12,806 0 0
Fotherby and Sons, Burnley	12,776 0 0
Bottoms Bros., London	12,340 0 0
Holland, Leicester	12,268 0 0
Musgrave, Hull	12,186 0 0
Stevenson, Ekeington, Chesterfield (accepted)	11,650 0 0

Engineer's estimate, £12,065.

MANCHESTER.—For alterations to two houses in Moseley-street, Manchester, for Mr. W. Roberts, Messrs. Tate and Poplewell, 20, Cooper-street, Manchester, architects. Quantities supplied:—

Gerrard, Swinton (accepted)	£1,112 0 0
-----------------------------	------------

MARLBOROUGH.—For the enlargement of Manchester street School by 300 places, for the London School Board. Mr. E. R. Robson, F.S.A., architect to the board:—

Oldrey, Wm. (accepted)	£1,574 0 0
------------------------	------------

[a) Cost of enlargement, including closets, £1,814. Special expenditure chargeable to site:—(b) extra foundations, £60; total, £1,874; cost per head, £6 4s. 11d.]

MATLOCK.—For erection of a footbridge in Dale road for the Matlock Bridge Local Board:—

Goddard and Massey, Nottingham (accepted)	£350 0 0
---	----------

METHUEN.—For alterations and repairs at the Free Church, Methuen. Mr. Clark, Methuen, architect:—

Accepted tenders.

Mason's work:—Davidson, W., Aberdeen.

Carpenter's work:—Webster, J., Aberdeen.

Painter's work:—Mason, J., and Son, Aberdeen.

Heating work:—Taylor, J., Aberdeen.

Total, £300.

METHUEN.—For additions to public school at Methuen, with shelter sheds. Mr. W. Clark, Methuen, architect:—

Accepted tenders.

Mason's work:—Davidson, W., Aberdeen.

Carpenter's work:—Webster, J., Aberdeen.

Slater's and plumber's work:—Ewan, G., Aberdeen.

Master's work:—Hutchinson, J., and J., Aberdeen.

Total, £361 8s.

MIDDLESBROUGH.—For alterations at Gunnergate Hall, near Middlesbrough. Mr. W. H. Blesley, Middlesbrough, architect. Quantities supplied:—

Painter's work:—

Taylor	£117 15 0
Lewis and Scott	115 0 0
Westgarth	88 10 0

Other trades:—

Sturdy Bros.	476 0 0
Johnson	470 0 0
Allison Bros. (accepted)	463 10 0

MIDDLESBROUGH.—For forming inclosure round the Bolekew Memorial at Middlesbrough. Mr. W. H. Blesley, architect:—

Stonework (exclusive of granite kerb):—

Fidler	£155 0 0
Lord (accepted)	141 15 0

Iron railing:—

Macfarlane and Co., Glasgow	101 10 0
Handyside & Co. (Limited), Derby	90 0 0

* Accepted.

MILLWALL.—For extensions of factory, for Mr. J. T. Morton, under the superintendence of Mr. W. Eve, 10, Union-court, Old Broad-street, E.C. Quantities supplied:—

Boyce	£18,773 0 0
Nightingale	1,772 0 0
Crabb	1,761 0 0
Monter	1,759 0 0
Nabett	1,750 0 0
Hall, Beddall and Co.	1,719 0 0
Abraham	1,697 0 0
Macey	1,616 0 0
Lawrence	1,579 0 0
Harris and Wardrop	1,571 0 0
Crisp and Tomlin	1,517 0 0
Shumair	1,485 0 0
Salt, Lincoln (accepted)	1,472 0 0

MORESBY, CUMBERLAND.—For erection of school and master's house at Moresby Park. Mr. W. Carmichael, architect. Quantities by the architect:—

Accepted tenders.

Mason's work:—

Davidson and Son	£782 0 0
------------------	----------

Joiner's work:—

Shaw	350 4 7
------	---------

Slater:—

Tyson	119 7 10
-------	----------

Plasterer:—

Tyson	86 2 0
-------	--------

Plumber:—

Stannern	83 10 0
----------	---------

Ironmonger:—

Hardle	78 15 6
--------	---------

Painter:—

McCorm	37 8 9
--------	--------

Total, £1,537 8 8

NEWPORT, MON.—For constructing a sewer in Bridge street, for the town council:—

Francis, J.	£625 0 0
Blackburn, W.	500 0 0

(Borough surveyor's estimate, £647.)

* Accepted as amended, on account of error, to £514.

NEWPORT, MON.—For the paving of Rapera-street, for the town council:—

Francis, J.	£78 0 0
Cox, H. (accepted)	74 11 0

(Borough surveyor's estimate, £74 11s.)

NEWPORT, MON.—For the improvement of Temple-street, for the town council:—

Cox, H.	£201 10 0
Francis, J. (accepted)	285 0 0

(Borough surveyor's estimate, £290.)

NORTHAMPTON.—For erection of a disinfecting-room at the Urban Sanitary Authority's yard in Scarletwell-street, Northampton:—

Heap, G., jun., Northampton	£97 0 0
Woodford and Son, Northampton	94 0 0
Wingrove, J. T., Northampton	82 4 0
Law, J., Northampton	79 4 0
Fisher Bros., Northampton (accepted)	77 0 0

[For remainder of TENDERS see page XVI.]

THE BUILDING NEWS.

LONDON, FRIDAY, OCTOBER 21, 1881.

GALE-PROOF ARCHITECTURE.

THE recent gale, the destructive fury of which has left its marks of havoc in nearly every town in the United Kingdom, affords a lesson to builders. In the records of the damage done on land we find evidences of a nature to show that where the full force of the wind was unimpeded every conceivable form of destruction ensued. Not only were the lighter kinds of erection overthrown with considerable violence by the hurricane, their fall doing damage of a serious kind, but we hear of thick walls being blown down, chimney-shafts overturned or seriously affected, shop-fronts blown in, and roofs dislodged or lifted off the buildings they covered. Sheltered streets fared no better than open districts in many instances, for wherever the wind found a channel for its force the effect was intensified. Wind as an agent is often neglected by the architect and engineer in their calculations. The recent Tay Bridge examination undoubtedly pointed to a structure which had been designed without any reference to a pressure such as that which overturned it. Engineers are accustomed to look upon a hurricane in this country as such a natural phenomenon as to conclude apparently that they may ignore it altogether so long as they provide for a pressure equal to from 50lb. to 55lb. on the square foot. But a lower figure has been usually adopted, the consequence being that when we get a gale such as we had last Friday, and the force of which amounted to nearly 60lb. on the square foot, many buildings could no longer stand before it. But what may be learnt as well from the accidents of last week is, that in nearly every building there are a number of points quite powerless to withstand a sudden gust or pressure of wind. The accounts which have reached us show that chimney-pots and stacks and loose slates are not the only things liable to be dislodged. Roofs have been lifted from walls, and, in some instances, carried bodily away; roof-coverings have suffered in a more general manner by the wind finding an entrance beneath, tearing them up and scattering the slates or tiles like so many cards. Lead or zinc roofs are quite as liable to this disturbance as those of slates or tiles, for the wind in many instances we know of has torn the sheets up and blown them away like thin pieces of paper. Being impervious, any wind which finds an unguarded joint or flashing enters and rips up the sheets, its action being like that of a wedge. We have seen dormer roofs completely uncovered in this manner, showing the importance of taking care that edges are well turned down or secured. Verandahs on the windward side of houses are common objects of wreckage; in several cases the roofs have been torn off their supports, being simply lifted by force, owing to the wind accumulating under them with no outlet for its energy. In many more instances the zinc coverings have been torn off or left partially hanging like so many shreds of paper, or boarding and rafters broken up like so much tinder. Destruction of this kind, experienced in numerous instances, affords ample testimony to the insufficient strength of architectural structures, and ought to make architects more careful in securing the plates of their roofs to the walls or pillars, in seeing that rafters are properly spiked at the ends, and in providing in all exposed positions where

flat pitches are used extra means of keeping down the rafters and plates by straps of iron or screw-bolts. It is almost inviting destruction to leave flat roofs trusting to their bare weight resting on a wall-plate without the slightest tie. Where windows have been left open the force of the gale has been known to blow out the walls or raise the roof bodily. Many railway-sheds, vestibules, and station-roofs have suffered from the wind of last week owing to a wedge-like or expansive force such as we refer to. The weight and extra precaution taken to wind-brace roofs of this kind have made some of them secure against sudden attacks, though we question if all railway roofs are quite safe in case of a hurricane or a sudden gust of wind entering them at the end.

Walls, as well as roofs, have been seriously shaken and damaged; we hear of many houses having been partially destroyed, and of walls having been blown down. Such accidents certainly need not occur if the most ordinary precautions are taken; but they are not. We see houses built every day with parapets which a pressure of half that of the gale of Friday last might bring down; gable ends only half a brick thick, and chimney-stacks of such height and width that they must fall if pressure on their flat surfaces of a few pounds to the foot is suddenly experienced.

Not a few disasters were due to windows and shop-fronts having been blown clean inwards. In one case in the City a front was blown in, to the danger of those in the shop, and several similar accidents have been recorded. It is quite evident that builders and shop-front fitters neglect to look after the secure fixing of their wood frames and plate-glass. Happily, wind does not often blow directly against a shop-front, or many large sheets of plate-glass would be blown in at the risk of those near. At least the fact of two or three fronts having been blown in, points to the necessity of fixing laterally by ironwork, and not merely blocking up, the frames of such windows, and of making the rebates in the bars deep enough to take the glass, and to allow of a fillet to be screwed on. The bars or mullions themselves are generally much too small in section to resist a cross strain; and there, also, some care should be taken. A light cast-iron stanchion, placed edgewise and perforated, is almost a necessity in lofty fronts, and these ought to be well fixed to the bressumer, and, indeed, might be made to render it some support. Casements are also dangerous, and householders ought to see that they are securely hung, and admit of secure fastenings; guttering, zinc-work, and finials need also constant attention, repair, and painting, if they are not to become dangerous appendages in time of strong winds. The rules for calculating the effects of wind upon structures are simple, and, if not well known, can be acquired by reference to any good textbook. It is hardly necessary to inform the reader that the whole surface of a flat wall is exposed to a pressure equal to the extreme wind-force multiplied by the number of square feet the wall contains, and that the greatest effect of that accumulated pressure acts at a point near its geometrical centre. When this has been obtained, it will be seen how powerful a force is brought to bear against a building, or its weakest points, which, if they were not stiffened by floors and other means, would be enough to blow in or destroy many walls which are still standing. An ordinary window is exposed to a pressure of about 1,500lb., under such a wind as we had the other day, and this pressure acts in its centre. Can we wonder when we hear of innumerable windows having been blown in? Rotten or insecure beads give way, or the whole frame loosened from the brickwork by constant shaking, or through decay or shrinkage, is blown in-

wards. We have said enough, however. Architects and engineers, are responsible to the public for the safety of their buildings and are looked to for the exercise of skill and care not only in large, but small matters. Wind-pressure of unusual violence is certainly a subject for more serious consideration than it receives, and those who have the designing and construction of buildings, ought not to ignore the power of a hurricane because it happens to be of uncommon occurrence in this latitude.

DOMESTIC FITTINGS AND FINISHES.

FEW things contribute more to the completeness, convenience, and comfort of a house than those small finishes which make up the trades of the plasterer, joiner, ironmonger, and decorator, in the usual specification. Yet, oddly, they are frequently left as a margin in the contractor's bill, by which he often manages to recoup himself for extras and omissions. What with the sums allowed for grates, ironmongery, door-furniture, and the other odds and ends of a house, the builder can often make a little profit by substituting inferior articles for those specified or priced out. Some contractors manage to take advantage of these little things, and, in so doing, the house is spoilt. How often, for instance, a little apathy and indifference on the part of the architect becomes a source of gain to a builder in such matters as door furniture, window-fastenings, details of joinery and plastering, &c. Architrave mouldings and cornices of a certain girth are specified, or they are to be worked to detail drawings supplied; but pressure of business or indifference supervenes, and advantage is taken of introducing mouldings of a very inferior character, or fastenings of the cheapest description. The builder has the happy knack of talking over his employer or architect at the right moment, and of telling him that he has some cornice moulds of the exact girth and design, or some kind of fitting which will answer perfectly; the innovation is promptly made, and the architect soon becomes aware that his compliance has cost dearly, and that the builder has misplaced the confidence reposed in him. It is rather of the value and use of details or "trimmings," as they are sometimes called, that we now speak. Who has not observed the meanness and penurious appearance of a large room without a cornice? It may even be well furnished, and its walls adorned with pictures; yet it has a niggardly and unhandsome look. Can we imagine one without a skirting? Such a room would not only appear mean, but it would be incomplete and uncomfortable. No carpet or furniture, however costly or artistic, can make amends for the want of this fundamental finish to the walls of a room. We do not see many well-built houses without these details, but we often find otherwise expensive residences spoilt by poor apologies for them. To take the ground-floor of a few suburban villas, there is a spacious vestibule and hall, but a small insignificant torus-skirting is put round, and the architrave mouldings of entrance doorway and reception-rooms are small, and were never intended for the position they occupy. Instead of being bold and more massive than the architrave mouldings round the doors of the reception-rooms, we find they are worked from the same plane, and the eye, if not the mind, is at once struck with a sense of disproportion. The same mouldings prevail in all the rooms: we find the morning-room with a cornice as large and bold as that in the dining-room; the doors are finished in the like style. It is one of the consequences of machine labour and steam mouldings, that

a saving builder will make one moulding and one pattern do for all the rooms.

In large buildings the value of multiple features like the same size of window and door-frames, and the same set of mouldings throughout cannot be doubted—a great saving is effected thereby; but the principle can be carried too far, to the sacrifice of appropriateness and artistic meaning. It is not uncommon to find a heavy cornice in a small room, dwarfing by its size everything else; or a small cornice in a large apartment. The eye instantly detects a want of fitness in such a disregard for scale, and we feel that every room is but a multiplication of the same details. It was not so in those periods of art we take for our guidance: every room was ordered by its size and height, and a general scale of proportion regulated by the height of the order, and the purpose of the apartment was adopted. Such a discernment at once shows a method in art, and that each part of a house has been regulated by some principle founded on common-sense and fitness. Architects, nowadays, seldom study the interior effects of their houses, and, except for decorative purposes, it is not usual to make elevations of the principal apartments and entrance-hall. Houses of a certain class are turned out from a plan, and perhaps a single elevation of the front; a kind of conventional treatment is adopted inside, which is left to the mercy of the builder. Can we wonder at the result of this kind of house evolution? A regulation interior is the consequence, with all the defects we have hinted at above. A few marginal sketches of moulding in the specification may be useful, if builders can be made to observe them, though even details to scale are not always scrupulously followed, unless careful supervision of the joinery and other details is made.

The selection of chimney-pieces, door and window furniture, and paper-hangings are almost of greater importance than the skirtings, cornices, and architraves. The chimney-pieces are generally priced out at a lump sum, or reserved, to be chosen by the employer or the architect; this reservation, however, as a rule, means simply that the builder shall not put in inferior goods. Good taste is out of the question, so long as the marble mason of Euston or Edgeware-roads is consulted, and it is not an unusual thing to find that a Gothic designed house has been fitted with marble chimney-pieces of purely "Classical" taste, with columns, entablatures, and all. Gothickesque, or non-descript kinds of chimney-pieces are the most pernicious forms the architect intrusted with small means has to contend against, for such articles are frequently left to the caprice of the wife of the employer, with consequences often very painful to dwell upon. A fancy or variegated marble is the chief recommendation, and plenty of carving or tiles in the jambs and mantel. The manufacturers of so-called art chimney-pieces have to indulge this taste, and we cannot wonder when we see at exhibitions designs after Mr. Talbert or Mr. Norman Shaw, which would shock any disciple of the schools of which those artists are the reputed leaders. With regard to over-mantels and sideboards, the most atrocious imitations of Gothickesque and "Queen Anne" find their way into houses which have been designed, or rather planned, by architects, but of which they never see the completion.

In the selection of door and window furniture, Brummagen manufactures are preferred; the door knobs, finger-plates, bell levers, and fastenings being of the commonest description, and in the worst possible taste. Imagine a house designed after the 17th-century style, with painted china or gilt knobs, and finger-plates to the doors, and yet such houses may be seen by

the dozens in the suburbs. It is less easy now to choose atrociously bad papers than it was 20 years ago, yet there is a redundancy of feeble imitations which have sprung up since the introduction of the recent schools of decoration, and we may do well to caution architects against specifying a certain manufacturer's paper without seeing that it is procured for at least the principal rooms. The mistakes made in selection of such fittings and decorations as we have pointed out are sufficient to upset, from an art point of view, the architectural design of a house; for if correct principles guide the designer in the arrangement and proportions of the rooms and elevations, it is more necessary that correctness and good taste should follow to the minor appointments, and pervade the details of the interior. It is hardly conceivable that people paper houses in the Italian style with Gothic patterns, or buy furniture of a modern, flashy kind for rooms after Queen Anne taste; but the fact remains, and is one worthy the attention of a social science meeting.

It is in these, if we so call them, minor art matters our French and Continental neighbours beat us. The English builder or tenant of the middle class regards them as trivial and unworthy of attention; and yet he feels their quiet influence at home. Well-fitting bolts and fastenings contribute tangibly to one's convenience and comfort. Why should not their design be regulated by common principles, and instead of being bedizened with flowers and meaningless ornament, made to agree with those ideas of utility which have invariably become the foundation of good taste?

THE TURNERS' EXHIBITION.

THE yearly competition among turners and others, for the silver medal and Freedom of the Company, and other prizes offered by the Worshipful Company of Turners, which has just taken place, increases in interest, and the exhibition at the Mansion House, last week, drew a great many visitors and connoisseurs. Something is due to the master, wardens, and hon. secretary of the Company, for the public spirit they have shown in thus exhibiting the works submitted, and the result of these annual displays is already evident in the improved taste and workmanship. The competition in wood is particularly meritorious, and shows many qualities which were almost absent in previous years. One of these is the improvement in design, the fitness of the work for the proposed end. The judges in this department have shown some discretion in their selection, and, on the whole, few will be disposed to find fault. Turning is an art in which a great deal depends on technical qualities and dexterous manipulation, hence these merits have in former competitions unduly influenced the selection. We do not find this time that such consideration has exercised so great an influence, and it may be generally observed that artistic merits have had weight.

The first prize, the silver medal and freedom of the company and of the City of London, has been awarded to J. S. Coulson, Kirkgate, Thirsk, the winner of the bronze medal last year, for four turned vases in acacia and purple-wood. The shape of the vase is well proportioned, and of pleasing outline; the body is of an ovoid shape, and as an example of symmetry and exactness of copying, there are certainly no specimens which can compete with it. The author satisfies all the requirements of the company in these respects. The most noticeable point in the production of these vases is the ingenious manner in which the artist has availed himself of the technical re-

sources of his art. The body of each vase has been turned out of the solid acacia, the square block appears to have been overlaid with slices of purple-wood, &c., and the whole being turned to an oval shape, the purple-wood has assumed the form of elliptical or oval rings, which in their shorter axes do not quite touch each other. Thus the body presents four ovoidal-shaped rings of a darker wood enclosing small panels of intersecting circles in the centre of each—a very simple and artistic kind of ornamentation, produced entirely by the lathe, and resembling inlaid work of the most perfect and exquisitely-finished kind. The neck and mouth, as well as the stem and base, are relieved by small discs of lighter wood, similarly formed by the lathe, producing in one case circular dots where they have been cut at right angles and oval forms on the splayed face of base where the circular pieces have been cut obliquely. These vases surpass those of the same competitor last year in artistic form and finish.

The second prize—bronze medal and four vols. of Holtzapffel's "Turning," is won by Mr. F. Nickolay, of Russell-street, Haymarket (who took the first prize last year), for a pair of paraffin-lamp stands and a pair of ewers to match, in ebony and a light hardwood. The design and execution are both creditable to the artist; the shape of the lamp base is appropriate, and the ornament is confined to simple and effective means of relief. The third prize (first certificate of merit and four guineas) is given to Thomas Macdonald, Millwall, for a rosewood vase, with dish and a pair of vases, relieved by white inlays and chequerwork. The principal vase is adapted for trinkets; the body is well shaped, with side handles, which join the upper dish-shaped receptacle. W. Kilminster, of Omega-place, N.W., receives the fourth prize (a certificate of merit and three guineas, &c.) for a pair of satin-wood vases on ebony bases, shaped to an octagonal form, the sides being turned or hollowed by the lathe. Both in outline, symmetry of shape, and novelty of design, these vases reflect credit on the artist. There are seven other prizes for work of more or less merit. Among these designs we notice a pair of vases, turned in pine, by ordinary lathe without rest, with slender stems, but of elegant shape. The artist obtains the seventh prize. A pair of grey ebony vases, inlaid with tulip-wood, boxwood on ebony and pitch-pine pedestals, are worth mention in this class for elegance of shape; also an inkstand and pair of candlesticks in pitch-pine and ebony, relieved by ivory and red-wood inlays. A pair of cups and vase in ebony, with carved applied figures of gladiators, were among the exhibits claiming attention, not so much for novelty of design as being exact copies from a Roman cup in the Guildhall Museum.

As clever pieces of mechanical manipulation, we may draw attention to a pair of cigar-stands, with spill-cups and ash-trays, in ebony and sycamore, the whole being turned; an ornamental stand, also entirely the work of the lathe, except the spiral stem of a basket at the top, relieved by inlaid work; a pair of twisted-stem candlesticks, and a flower-stand of ebony and ivory, with a centre stem, supported on three lower pillars, connected by arched buttress-like pieces. A rather heavy design for a jewel casket, temple-like in form, exhibits skilful turning but is poor as a conception of fitness of design. The Company has received several works from amateurs in the art, and Mr. Samuel Morley, M.P., and others have enabled the master and wardens to increase their prizes in this direction. In this class we notice, on a side-table, several specimens of wood-turning. The first prize is given to L.

Lewis, of Mile End, for a tankard in ivory, of considerable merit. We notice also some well turned and carved balusters, under the motto "Nec Aspero Terrent," and a clock-case of walnut, relieved by brass mounts. J. Satchell, of Watford, Herts; R. V. Burbidge, Coventry; and W. H. Payton, Hoxton, receive prizes in this department.

In the class of Pottery, the judges include the names of J. J. Holtzapffel, C.E.; Horace Jones, City architect; C. F. Newton, C.B. (British Museum), Geo. Wallis, F.S.A. (of the South Kensington Museum); and the first prize (Freedom of the company and of the City, &c.) has been awarded to Alfred Dupuis, Prince's-road, Lambeth, for some vases thrown on the wheel in one piece, without joints, and not afterwards shaved or turned. In form the pottery is creditable to the artist, and the execution leaves nothing to be desired. The other successful competitors in class A are Thos. Ellis, of Vauxhall-road, who obtains the bronze medal for a vase of ovoidal shape; W. Bolton (first certificate of merit), Battersea, and H. Bryon, Clapham-road. The silver medal in the next class goes to Henry Hollins, of Bromley-by-Bow, for a large terra-cotta vase, rather lumpy in form, but executed in accordance with the condition that the throwing and turning were both to be the work of the same person. Thomas Blyth, of Vauxhall, takes the bronze medal, A. Dupuis (Lambeth) the third prize, and H. Mashman, of the same parish, the fourth. In class C, in which the condition required that the pottery was to be turned or shaved, ornamented by hand-tool or incised, and glazed or coloured, Thomas Colbeck, St. Mary Church, South Devon, is the winner of the silver medal. The bronze medal goes to Marshall Watson, of the same place, for a red terra-cotta epergne. The above are the principal winners of prizes; but these classes of pottery have a higher interest for the general observer. Apart from execution, these examples of fictile skill show us a variety of types of plastic design from coarse copies to Greek elegance. Several white and buff-coloured terra-cotta vases may be mentioned, the bodies of which are of ovoid shape, but the proportions are not pleasing in all. We noticed a pair of red terra-cotta vases, of Greek form, with handles, in Class C. "Cœur de Lion" is the motto of some large vases of rather heavy outline, while one of the prize works (W. Millard's) shows a very small base.

The competition in metal is not large. The qualities required are truthfulness in turning, and accuracy in fitting and finish. Pure hand-turning is preferred to the use of the slide-rest, and accurate copying and elegance in form are demanded. The judges in metal included Sir Henry Bessemer, C. H. Gregory, C.M.G., Col. W. Haywood, and R. P. Williams. We find the first prize has been given to A. E. Nelson, Canonbury, for a pair of flattening-rolls for flattening pendulum spring wire, the work being turned with a diamond. The bronze medal has been gained by H. A. Alexander, Camberwell-road, for a hall joint, showing accuracy in fitting and finish. The third prize, won by C. J. Barber, Fitzroy-square, is for a tazza vase in brass; the fourth prize (Stephen Davall, Essex-road) is for a pair of pedestals, surmounted by birds; and another contribution is a pair of library branched candlesticks, the separate pieces of which are all turned in brass. We notice also a new compensation-balance for a chronometer, in which the compensation is managed in a more simple and economical method. It is a noteworthy fact, that many of the successful competitors in wood-turning last year have again won prizes. We have already mentioned the names of the first and second prize-winners, who have changed

places this time. T. Macdonald, the third-prize winner, takes this year the same prize, while W. Kilminster, who won the fifth prize last year, takes the fourth. We also notice the names, in this year's list of successful competitors, of two or three other artists whose works have been conspicuous on former occasions. We do not see any examples of intaglio engraving and stone cutting, like the collection exhibited last year, and the horological specimens are absent.

DANGEROUS CHIMNEYS.

THE gale of Friday last developed, among others to which we have more generally referred elsewhere, a danger not hitherto regarded as one of a very serious or alarming character. In the account of accidents caused by this unusually early and severe storm, a considerable portion of the casualties (at least so far as the land is concerned) was due to the fall of chimneys. There is in the metropolis a comparative paucity of industries requiring the aid of lofty shafts to encourage and assist in the combustion of fuel for generating steam; and we are, therefore, the more surprised at the extent and character of the recent disasters in that direction. In the great manufacturing centres of Lancashire and Yorkshire, much attention is given to the construction of the high chimneys, which occupy an important position, for without their aid steam could not be forthcoming, and the industries dependent in its potent agency would speedily collapse. Hence the care bestowed on the erection of these lofty "stalks," their construction being confided to special workmen, who deftly rear them up, producing some of the best examples of brick construction in the country. The Lancashire chimney builder does all the work of construction "overhand," operating from foot-holes inside the stalk, up which all the materials are hoisted. The best and most general form of these excellent chimneys is circular, thus securing not only facility of construction, but a capacity to withstand external pressure during storms. The two well-known high chimneys at Glasgow were built to overcome the damages caused from the outflow of deleterious gases in the extensive chemical works of which they now form an important and indispensable adjunct. These great chimneys are highly creditable examples of brick construction, exceeding in their height St. Paul's, and may be regarded as creditable monuments to the industrial enterprise which led to their construction.

Chimneys so circumstanced suffer but little damage from the most violent gales, and when an exceptional disaster takes place, its cause is generally traceable to defective foundations or a too hurried uprearing of the superstructure. Small chimneys, whose functions being of limited character, are, generally speaking, built up in the most hurried and careless manner, and in such positions as to render them specially liable to the damaging influences of sudden and violent gusts of wind. Not less dangerous, and perhaps more subject to disaster, are the slender and attenuated chimneys of the dwelling-house, which, owing to the obtuseness or indifference of the architect, are placed in all positions in and around the modern villa. Central stalks or chimneys are not now much the fashion, although past experience proves they best provide against many of the inconveniences resulting from back-draughts and their inseparable accompaniments of smoke. Many a well-constructed grate and fireplace is blamed for inefficiency where the true cause of their faulty action is due to damp and cold flues in external and badly-clothed chimneys. To maintain the true action of a chimney-shaft of any kind it is necessary that it should be

protected against weather-dangers, or, in other words, built with sound and non-absorptive materials, and thus rendered capable of resisting the insidious influences produced by abnormal gales or rainfalls.

Although, unfortunately, the late gale caused much damage to many fair to look at chimneys, the "pots" also, in a greater degree even, helped to swell the long list of disaster and death. The chimney-pot proper receives but scant attention in the metropolis, from its being regarded as a matter of little import, its shape and capacity being left to the whim or caprice of the bricklayer. This question is not so treated in such cities as Glasgow and Edinburgh, where special provision is made on the roofs of the houses, commanding ready access to the chimney shafts for the purposes of reparation, or other necessary attention, to what is regarded in the North as an important part of the building. Chimney-pots are looked upon as ornamental factors in the scheme of London house-building, and, from their variety and grotesqueness, it would appear as if some artistic efforts had been applied to their design and fabrication. Their prominent position, stuck or placed on the top of a brick stalk, is frequently ludicrous; but the smile which their appearance is calculated to create is speedily repressed when it is considered how much danger lurks behind their ornate nothingness. Chimneys and chimney-pots are in themselves sufficiently alarming and dangerous in their effects when tilted from their ill-chosen and imperfectly-protected position; but the more widely-spread disaster they occasion in breaking through roofs and crushing weak walls, is the most damaging outcome during storms.

There are an innumerable lot of small detached chimney-shafts in every populous town, placed in out-of-the-way corners, which have been recklessly constructed, being used in connection with bakers' ovens in the midst of dense populations, which, from their position, are more liable to be overthrown in exceptional weather. In London there is a sort of "roving commissioner," or some such officer, who, aided by the police, pounces down upon unfortunate bakers who are found neglecting the consumption of the smoke from their oven-flues. Such an authority should be supplemented by an experienced builder, who should examine these numerous frail structures, and where found deficient in stability, order them to be pulled down, and thereby avert the dangers which they now too frequently cause. The passer-by along the main streets cannot see, and therefore knows nothing of, these dangers lurking in secret places beyond his "ken"; but let him step aside, and, in such districts as Whitechapel, a very little trouble will convince him that there exists in such quarters a state of things hardly credible. He will find some very eccentric-looking structures, many of them bolstered up and kept together by singularly-contrived combinations of wood and iron, which, under ordinary circumstances, suffice to maintain them in a fairly perpendicular position.

It is surprising that the chimney dangers, although capable of comparatively easy avertibility, receive but scant attention at the hands of architect and builder, from which it may be inferred that they regard the question as one of slight importance. A chimney to be capable of performing its main functions, should be solid and substantial in character, having a capacity of securing—under all circumstances—perfect draught and comfort to the house in which it is built; with perfect freedom from smoke and back-draught. The chimney hitherto has been mainly considered as the prime heat-producing agent of the household; but in the not far distant future it will become an important factor in the needful schemes of ventilation which are now gradually

moving to the front. When that time arrives, the architect must give more heed to the question of the chimney, and properly provide for its stability and efficiency. The foundation on which it will be based must be solid and durable, and not only competent to withstand the pressure placed on it, but it must also be built of such materials as will prevent the ascent of ground-moisture from below, and resist insidious climatical influences from above. When the chimney and its proper functions are better understood, and accounts taken of the future work it has to perform in warming as well as purifying the house, more attention must be given to its character and details.

THE INDIAN PUBLIC WORKS DEPARTMENT.

SOME time since we noticed a small pamphlet, by Mr. Alexander R. Binnie, M.I.C.E., in which that writer exposed the large expenditure connected with the present Public Works Department in India, and hinted how its functions might be improved and economised. We have now before us a reprint of a minute by Sir Andrew Clarke, R.E., K.C.M.G., &c., late public works member of the Council of the Governor General of India, in which a scheme of reorganisation for that long mismanaged department of the public service is sketched out. The suggestions it contains were printed as long ago as 1878 in the *Indian Public News*, and coming from so competent and experienced a member of the department in India, we may accept them with some confidence. In this reprinted minute Sir Andrew Clarke sketches the early history of the department, showing that the whole of the engineers were drawn from the army, either from the local corps of military engineers or from the officers of other branches of the East India Company's army. In 1852 the engineers were recruited by the past students of the Thomason College, and in later years English engineers of some experience were sent over under an agreement with the Court of Directors. The young men known as the Stanley Engineers were selected by competitive examinations in 1855; but the supply being inadequate to meet the demands of the operations of the department, the Government of India requested the Secretary of State to advertise for engineers of different grades. Cooper's Hill College, established in 1870, failed to supply the number required, partly from the strictness of the examinations required; and recourse was had to the employment of eligible men who might be leaving the guaranteed railway companies. The present sources of supply of engineers are, according to this return:—1, officers of Royal Engineers; 2, civil engineers from the Indian Colleges; 3, civil engineers from the Royal Indian Engineering College; 4, special appointments. From those sources the number from Cooper's Hill is put down at 45 annually, and only 12 from the Indian colleges. It is also estimated that for the present time the maintenance of the department and the control of guaranteed railways require a total of 1,358. This estimate is based on an annual expenditure of £2,700,000 on State railways, and £1,300,000 on irrigation, and an ordinary expenditure on buildings and roads of £1,500,000. The existing strength at the time of this minute was 1,250. Sir Andrew Clarke assumes that in a year or two, at the present rate of supply, the strength will become commensurate with the expenditure. At present there is an excess of engineers on the staff, attributable to the want of a liberal scale of pension, which would have induced engineers to retire. This reluctance hampers the Department, and does not allow for passed students to enter. By re-

taining on the staff engineers in excess of actual requirements, the establishment cannot transfer to other branches of the service, and the result is that certain provinces object to have to pay for more officers than are really wanted on public works, and rightly argue that the expense should fall on the Imperial revenue. These objections are strongly made by the Bengal Government on account of their irrigation works, and other provinces have an equal right to urge the transfer of the excess of engineers; but, as will be seen, if these proposals are accepted, the Department would be burdened with officers on full pay with no work to do. The minute calls upon the Secretary of State to defer the supply from Cooper's Hill, and to reduce the number of engineers. As may be imagined, there are a number employed who are not up to requirements, and the older engineers are not equal to the demands of modern engineering, having been employed when the work was easy. Sir Andrew Clarke very forcibly recounts the results of incompetence from either physical incapacity to supervise work, or from other causes. The amount of mischief thus caused is incalculable, and it is cheap to remove such men. The mistakes are irremediable, and the money spent on bad work is wasted. Engineers, above all other officers, have to keep abreast of modern science.

The slowness of permanent promotion from these causes is urged as another reason for the reduction of the number, and the writer enters into the means that ought to be taken to insure it. The Pension Code is inapplicable, as it does not apply to engineers of the department, and never contemplated a large reduction, while the very framing of the code implies a permanence of engagement, and its terms have no doubt hindered any officer retiring on pension. By the code no person could voluntarily retire on pension until he had served 30 years in India, or had reached 60 years of age, except in case of infirmity. It is truly pointed out the hardship of compulsory retirement on those civil engineers who have been born and educated in England, and have accepted Government service in India. The service is only professional employment, in fact, open to them, for there is no chance for a civil engineer to practise privately in a country whose works are under Government.

Sir Andrew Clarke proposes that the least useful of the engineers should be compelled to retire on similar terms to those of the Government in the case of the Civil Service officers. The amount of pension is regulated according to the Superannuation Act, but we have not space here to enter into the figures. The minimum pension is proposed at £200 a year for executive engineers, and a bonus of one month's pay for each year's service in cases of removal.

The annual saving effected by the retirements thus proposed is, according to this statement, about £50,000 in round numbers, besides the increased efficiency of the department. After discussing the rate of promotion and the existing pension-rules of Royal and civil engineers, the minute enters into the special requirements of military and civil engineers, and the value of Thomason College. Sir Andrew Clarke does not approve of the institution of a special Civil Engineering college in England for the supply of engineers to the Public Works Department—an opinion many besides ourselves have shared in. It was an insult to the Institution of Civil Engineers, and to the Indian colleges who have supplied competent men for the service. With respect to the training of natives, the recommendations are strongly in favour of educating natives as engineers. They exhibit less self-reliance than the English engineer, but their association with Europeans is important. Of natives, the up-country people are con-

sidered more practical and energetic than the Bengalis. With regard to Cooper's Hill College, we agree in thinking it is not needed for India, as it compels the Department to take a number of assistant engineers, whether they are wanted or not. The practical part of their training is ineffectual, and it is quite evident the student learns to become more of an accomplished theorist than a practical engineer. Articleship is suggested as a remedy, and the college course limited to two years. After the prescribed test of knowledge is passed the student might be articulated to a civil engineer in practice, the premium being partly paid by the student. Referring to Cooper's Hill, the minute expresses the opinion that its scope might be enlarged for the education of youths for the profession generally, and so made a national school of engineering.

Such, in short, is the gist of the recommendations made. The permanent staff could be supplemented by engineers of special experience for short terms, larger salaries being given to them if necessary. By these means the present surplus would be diminished, the most efficient of the staff maintained, the military works branch would be placed on a military basis, and the Department be made to work with more economy and certainty.

STONEHENGE.—II.

WE have given (p. 420) a Section of Stonehenge, with some account of it, or rather of the uncertainties of it, as a memory of the distant past of things. We now add, to make matters a little clearer, a plan taken from an old engraving, made in the last century, when Stonehenge was in a somewhat more perfect state than it now is. It shows, we believe, with some approach to accuracy, what the plan of this primeval temple was when first built, or rather when its huge monoliths were raised, and dedicated to their purpose, whatever that may have been. It would be somewhat curious to speculate on the methods adopted in those early days of architectural practice in the setting out of such structures as Stonehenge, for there must needs have been some difficulty here. In the plan it is seen as a circle of huge stone blocks, some hundred feet or more; for the dimensions, as given by divers measures, do not quite agree in diameter. These are thirty in number, and may be, indicate a something in this very number of them. They are from 11 ft. to 20 ft. in height, and are covered by a stone coping or "cornice," each block of it reaching from the centre of one supporting monolith to that of the next, forming thus a complete circle, in no way interrupted by any special sign of a doorway or entrance, the circle of stone blocks, being thus simple and complete. Thus it is that the outer wall, if we may so term it, of this so-strange temple is built up. Immediately within this outer wall, and at about seven to eight feet from its inner face, is another circle of much smaller blocks of stone, thirty-six in number. These are about 4 ft. in height, and are certainly not the least curious part of this strange structure. If we but dared to speculate as to their use, we should be inclined to say they marked out the bounds of a "processional" way, for all goes to show that in the primitive and by-gone faiths, whatever they might be, processions always formed a marked feature in them, and that, to join in one of them was in itself a religious act. We venture but to hint at this by way of explanation, for, of proof we have, of course, none whatever. This brings us to the oval of the great trilithons, and which immediately inclose and surround the altar; and here again most surely there is mystery enough to puzzle the most

curious and exacting of those who like architectural curiosities. The altar itself is nearly in the centre of this circular temple, and all the authorities would seem to be agreed as to its use—that of sacrifice, probably human sacrifice. It will be noticed that these huge masses of stone are in pairs, five in number, but their covering stones, or cornice, if that be a better term, are not, as above, continuous, but each trilithon is complete in itself, and distinct, and must needs have had its signification.

But between this altar and the great trilithons there is a row, or half-circle, of monoliths, about 8ft. in height, the use or meaning of which is, as it would seem, as impossible to define as is the import of the other circle, as above indicated. They must, it is sufficiently clear, have had some most significant meaning and import, if not use, or they would hardly have been so placed, and in such close contiguity to the altar

and want of a quite accurate plan; and the more this so strange structure is looked at and into, the more will this want be felt. Indeed, as we attentively examine it, the further we find ourselves from accuracy, and from, as it would seem, possibility of getting at it, certainly from books. The height of the trilithons range from 16 to 22ft., and, somewhat strangely, rise in heights from the entrance, or open way opposite the altar, as do the stones of the outer circle. Thus, generally, is the altar end of this strange temple built up of larger monoliths, the ruling idea of the whole structure being to concentrate the mental impression made to this altar and its nearest surroundings; and thus, without doubt, to those who ministered at it. It is hard to say whether a structure such as Stonehenge is most significant when in use, or when in ruins. Originally, it was made up of 240 stones, the outer circle of 60 stones, 30 up-

with its altar and surrounding trilithons. It may also, as has been thought, have been used as a burial-place or cemetery, and was certainly regarded as sacred ground. Stonehenge could hardly be thought complete without this "nave" to it. The earthen wall round it is some 15ft. in height. Not the least curious item in this architectural problem is the uncertain heights of its several parts and details. Was this intentional or the result of accident? The trilithons range from 16ft. 3in. to 21ft. 6in. The outer wall stones are 14ft. about, while the inner line of stone blocks are but about 4ft. in height. May-be, and it would be a curious fact in "architectural practice," that the very material, the very stones as found on the earth's surface, though from a distance, governed to some extent this strange and rude idea of a temple.

We need hardly say how much more needs to be inquired into before any really definite idea of this rude temple, built up long before the "historic period," as the geologists have it, commenced—a but too limited outlook, as it would seem. Stonehenge, strange and beyond the reach of written record as it is, does not stand alone in the world, for there is good evidence to show that in it and in other structures (if we may use that term) like it, we do, indeed, find the beginnings of at least stone-built architecture, and through it, of a desire to express something and a somewhat in ponderous stone, the which could not be done in any other way. Stonehenge, as we say, does not and did not stand alone. All over the world, on wide open plains and in the very midst of dense forests, primeval forests, as Humboldt terms them, there are yet to be found these huge stone masses, singly and in pairs, and in the form of trilithons, one stone on two others. In the French Carnac, on the coast of Bretagne, are yet to be found ranged in long, straight lines, eleven in number, some 30ft. apart, no less than four thousand of such monolithic blocks on a wild sea coast, far from human habitation, and where the motive for such building must have been indeed powerful. Powerful must that impulse "to build" have been, when the distances are known from whence these huge and ponderous blocks of stone were brought to their final destination—a right curious problem in architectural art; a glimpse at the work of prehistoric humanity.*

C. B. A.

PLAN OF STONEHENGE.

1, altar; 2 2, inner circle of small stones; 3 3, trilithons (five in number); 4 4, circle of small stones within. a, a, ground 300ft. across, bounded by the "vallum."

itself. Here at least the "imaginative faculty," as Ruskin has it, may revel at will, and as long as convenient, for these blocks of stone certainly do not help the impression made by the great trilithons. Doubtless they had an important symbolic meaning, as well as probable use, for whatever the merits of the old-world architectures, as compared with the things architectural of the present, they at least possessed this one—that of a never-forgotten utilitarianism and purpose; all was planned and built up for a practical use, and ornamented and named afterwards. These smaller and inner monoliths are built up as seen, almost touching the great trilithons, and they certainly do not indicate, as do the outer circle, a "processional way." These two inner and smaller circles of stone blocks, or lesser monoliths, so close to the larger masses, do not more surely help us to a clearer insight into this old-earth memory in stone, but the reverse; but of one thing we do feel quite sure—they had a definite use and purport.

We have already made note of our sad need of further and accurate measurements,

right blocks and thirty imposts, of which only 24 now remain, seventeen upright and seven fallen. Eleven uprights have still their imposts, or cornice blocks, on them. There are 40 stones in the inner circle, of which only 19 remain, and but 11 standing upright. The Adytum is of 10 stones, from 16 to 22ft. in height, with 5 imposts. Within these are the 19 smaller single stones, of which there are but six still standing. The altar is nearly in the centre, and is simply a flat level stone.

We may now, missing much, come to what we must suppose the "congregational" portion of this so strange prehistoric temple—viz., the large space of ground round and outside the outer circle of monoliths and within the line of the vallum, or high mound of earthwork surrounding the whole of it. This is some 300ft. across, is circular in plan, as the temple itself, and the purpose of it was evidently to insulate the more sacred temple and precincts, and to provide space for those who worshipped, and is evidently as much a part of Stonehenge as is the very temple itself,

THE BRITISH ARCHEOLOGICAL ASSOCIATION.

AUTUMNAL LONDON MEETING.

THE provincial members of the British Archaeological Association, accepted last autumn an invitation from the council to spend a few days in London. The experiment proved very successful, and has during the past week been repeated. About sixty ladies and gentlemen took part in a series of visits to old buildings extending over four days.

FRIDAY.

The opening visit was paid to *St. Paul's Cathedral*, when a large party were received at the western entrance by the Rev. Dr. W. Sparrow Simpson, F.S.A., who conducted them round and throughout the building, pointing out the leading features in lecturettes at intervals. The remains of the chapter-house and cloisters, discovered four years ago by Mr. F. C. Penrose, were shown; Dr. Simpson remarking

* It is not a little curious to note here that Mr. Darwin points out, in "Worms and their Economy in Nature," that even Stonehenge itself, sturdy as it looks, has not been by time alone brought to its present state of falling ruin, but that a portion at least of this has been brought about by the slow though so sure action of the earth-worm, which has undermined it, stone by stone, and that the very monolith which Sir G. Antrebus has propped up, has probably been put out of the perpendicular, not by time or the iconoclast or destroyer, but by the slow action, century after century, of the worm that dieth not.

that the drawings by Hollar and others, showed that the octagonal chapter-house had the peculiarity of two open, unglazed stories; these were covered in by a truncated roof, which, he had recently ascertained, during the public records inquiry, lost its spire by the same fire in 1861 which destroyed the great one on the central tower. The churchyard cross had been found to be much nearer the N.E. angle of the former cathedral than the old plans and views represented. Passing into the crypt, which, Dr. Simpson mentioned, had only recently been opened out and freed from the hydraulic apparatus of the organ, the few fragments of Medieval sculpture still left were shown, and the visitors entered the south aisle of choir, where has been set upright on a niche in south wall, the only perfect pre-Reformation effigy, that of Dr. John Donne, Dean, close to the statues of Bishop Heber and Blomfield, and Dean Milman's altar-tomb. Passing into the chancel, the high-class workmanship of Huntingdon Shaw's Sussex iron gates (which have been illustrated in these pages) was alluded to, and Grinling Gibbons' flower, fruit, and cupid carving in the stalls and divided organ-case pointed out. When in the library, Dr. Simpson mentioned that almost all the ancient MSS. and books were lost in the Great Fire, and the silver binding of an ancient volume was stolen, together with all the plate, in 1810. There were two chained books, both classics of no great value, a large-paper copy of Walker's Polyglot Bible, presented by the Duke of York, and a few other valuable works. From under lock and key Dr. Simpson exhibited a copy of "Regulations" for Henry VII.'s Chapel, Westminster, richly bound in velvet with silver mountings, and mentioned that one of the other six copies, similarly printed and bound, could be seen at the British Museum. An examination of Wren's original model for St. Paul's, and of Mr. B. E. Ferrey's elevations and plans of Old St. Paul's, pronounced by Dr. Simpson to be the most accurate yet prepared, was followed by a walk round the Whispering Gallery, where the lecturer recommended his hearers to attentively study Thornhill's paintings, as cartoons were now being prepared by artists for replacing them with mosaics—a substitution which he thought was not to be regretted, as the paintings were not well drawn or conceived, and had been so much touched up by Paris, that they exhibited little of Thornhill's actual work. At the close, a hearty vote of thanks was passed to Dr. Simpson for his interesting descriptions.

After luncheon, the members proceeded to the priory church of *St. Bartholomew the Great*, Smithfield. Here Professor T. Hayter Lewis, F.S.A., delivered an address which he opened by remarking that they had assembled in the remains of the choir of a great Norman building, in which, although much had disappeared, little had been added during restoration, so that it would be comparatively easy to follow its history. He would at once point out that the modern replacements were two circular shafts facing each other, behind the pulpit and reading-desk, the two central piers in the apse, and the tracery of clerestories and of the north aisle windows. The building was founded during the reign of Henry III., early in the twelfth century, by one Rahere, prior of the Augustinian Canons, who also founded the adjoining hospital. The building of the church was begun in 1103, the choir was consecrated in 1123, and the rest, whatever that might signify, ten years later. It was thus coeval with the naves of Durham (1099-1128) and Norwich (1121-45) and the choir, its aisles, and the transepts of Peterborough (1118-1133). The choir of Norwich was somewhat earlier (1096) and both it and Peterborough, like this priory, had apsidal ends. The church at the first had also an eastern apse with a processional aisle round it, and it once, according to a seal, an impression of which attached to a charter of 1133 had been shown him that attributed for the first time (although copies of it had often been engraved) had three towers. Prof. Lewis discussed the question whether the nave was built in Norman times, and from an incidental reference in Matthew of Paris's narrative of Archbishop Boniface's visitation in 1250 to "the middle of the church—viz., the choir," concluded that it was actually erected. In the thirteenth century this western part of the church was rebuilt in the style then prevalent, and great alterations were made in the church early in the sixteenth century by Prior Bolton,

to whom we owed the picturesque oriel on the south side, the tomb (as it now appeared) of Rahere, and the clerestory tracery. In 1544, Henry VIII. sold all the priory buildings, but directed that the chancel should be parochial, as it still continued. The nave, however, was pulled down, and the site converted into a burial-ground. The piers to south aisle of nave were standing till 1856, when they were taken down to widen the path, but the bases remained, and these have recently been brought to view by lowering the soil. The unsightly brick tower, at the present west-end, was said to have been built in 1622-8 in place of the steeple, then pulled down to its foundations; but he doubted whether at that period the public taste would not have been too good to sanction such a structure. The whole church was doomed in the early part of the present century, on the plea that it was dangerous, and was only preserved by the energetic efforts of an architect, Mr. Hardwick, an ancestor of the architect of that name now living. He would next refer to the church and its surroundings, and the alterations which they had undergone. At the east-end of choir, beyond the apse, were considerable remains of a large building, evidently entered from the church by an opening about 20ft. wide; the piers, with Perpendicular capitals, and the side walls, existed even now. This room appeared to be contemporary with the straight wall which still stood off the upper part of apse, but of which the lower third was removed in the restoration of 13 years since. On the south side of the church in which they were assembled had been the buildings of a complete monastery, and of these an excellent notice appeared in the *Gentleman's Magazine*, Vol. 79, pp. 226-7, describing their state in 1791. Prof. Lewis here exhibited a large block-plan of the church and its adjuncts, prepared by Mr. Tavorer Perry, and showed that the nave was formerly flanked by a cloister 100ft. square; that east of the south transept was a chapel, and from it extended in a long narrow line southward a range of groined buildings, above which was the dormitory. Of the cloisters, ninety years ago, when the article he referred to was published, only the east walk remained, and was then used as a stable; it fell in 1833, and had now entirely disappeared. On the east side of the cloister was the chapter house, an oblong department built in the 13th century and of which 3ft. to 4ft. height of walls remained in 1791; they were now destroyed and the space built over. Directly against the south transept, to the east, was a small chapel, of which no trace but the doorway from choir-aisle now existed. To the loss of the nave three centuries since he had already referred, and the south transept had also been removed more recently. The last feature lost was the series of vaults abutting south on the chapter-house, which were 130ft. in length by 30ft. wide; they were, he distinctly recollected, groined from the walls on to a central row of pillars alternately round and octagonal. Indeed, he (Prof. Lewis) showed it in a plan and report he drew up in 1868. When he recently visited the place, he found, to his surprise, not a vestige remaining, and that the site had been covered by an ordinary building erected for parish purposes. He had written to the architect about it, but would not expose his name. The restoration of 1868 was next described, Prof. Lewis mentioning that he was associated with the late Mr. Slater in the work. The floor was lowered between 2 and 3 ft., the site drained, and a column on either side of the building, which was being crushed by the weight, was replaced by another, the stones being intentionally used of larger size and differently treated to mark the new work. The apse, then, was cut off by a 15th-century straight wall, the upper part of which, occupied by a fringe factory that encroached into the church, they were unable to remove. They had, therefore, to make the best of it, carried the obnoxious wall on an iron girder and columns, and opened out the eastern aisle. In the wall were found worked up a great quantity of Norman caps and mouldings, which were now shown at the east end of south aisle. Where the two central piers should have been was a deep channel-hole filled with bones. They, therefore, had to supply these from the foundations. The wall of north aisle was then needed, forced to an upright position, and underpinned, but the north triforium space still continued to be used, as they had rudible demonstrations at that

moment, as an infant's school. All the wall were cleaned from whitewash, as far as it could be done without effacing the original tooling of masonry. The lecturer referred to some detail of the building, including the remains of the Early English nave, the Perpendicular reworking of the western corbels of central tower-arches, the eastern ones still retaining their Norman appearance; and the curious fact that whereas the east and west tower-arches were circular, those to north and south were pointed. He believed them to be later insertions. As illustrating how easily even a careful student of architecture might be imposed upon, Prof. Lewis mentioned that some time since he saw a well-known writer, who had done good service to archaeology, carefully measuring the south aisle with some assistants. He had since been surprised and amused to see that the writer in question propounded a theory, based on his measured drawings of the south aisle vault, that the 12th-century architect was inspired by Byzantine influence. Undoubtedly the vault was semi-dome, but the writer did not seem to be aware that it was built in lath-and-plaster in the year of our Lord 1830, by one John Blyth, district surveyor.

Mr. E. P. Loftus Brock, F.S.A., hon. sec., gave reasons for believing that the nave existed in Norman times, and showed that, as in some other churches, the monks' stalls extended west of the central tower. He endorsed Prof. Lewis's theory as to the date of the side arches in central tower, and described, in detail, the two most interesting monuments in the church: the 15th-century one to Prior Rahere, and that in the south aisle to Sir Walter Mildmay, founder of Emmanuel College, Cambridge, remarking of the latter, that it was interesting to find, at so early a date as 1589, all Gothic mannerisms completely abandoned, and a stately monument erected in good Classic style, with an Elizabethan feeling of picturesque, and a lavish use of variegated marbles, gilding, and applied colour.

The members then proceeded to the *Courtyard of St. Bartholomew's Hospital*, where the clerk to the governors, Mr. Crose, had arranged, on a long table, a fine series of charters and deeds, some of which, he said, had never been uncovered in his time. Most of these had their seals, or portions of them, still attached. The earliest was on the grant to Rahere in 1136, and showed the Norman church to which Prof. Lewis had alluded, but which Mr. Brock and others considered to be merely a conventional representation of a church of the period. Two great seals of Henry III., one dated 1255, another of the 21st year of Edw. III., and the final grant of the church and monastic building by Henry VIII. (1544), a lengthy and well-penned document, were among the more interesting charters.

The day's proceedings were concluded by a visit to the remains of the Roman villa and hypocaust under the Coal Exchange. These, Mr. Brock remarked, were preserved by the efforts of the British Archaeological Association in 1848, when the exchange was rebuilt.

SATURDAY

Morning was spent in the City, *Barber Surgeons' Hall*, Monkwell-street, being the place of assembly. In the hall they were received by the present master, Mr. Woolley, and by Mr. Charles J. Shoppee, past master. It is an oblong room, with Renaissance plaster enrichments, and good panelling; it was built by Inigo Jones, and repaired by the Earl of Burlington. It is decorated in green and gold, and has a central elliptical lantern, constructed about sixteen years since by Mr. Shoppee, who, as the premises were being rebuilt, also removed the fine hooded doorway which formerly faced the street, to the interior of the courtyard. Mr. Geo. Lambert, F.S.A., read a lengthy paper upon the history of the company, and called special attention to the principal picture on the walls, that by Holbein representing King Henry VIII. granting the charter combining the barbers and surgeons into one company in 1541; it is 10ft. 3in. by 6ft., and contains, besides the portrait of the King, which is of the conventional type, those of eighteen members of the guild, most of them distinguished by names written on the face of the picture. Shoppee says in his diary that he proposed to buy the picture for £200. Amongst the other noteworthy pictures are a portrait

of Inigo Jones by Van Eyck, and one of the Countess of Romsey by Sir Peter Lely. Mr. Shoppee exhibited the fine collection of plate belonging to the company, including a drinking-cup and cover in silver gilt, presented by Henry VIII., and of which cup, Mr. Lambert showed, the upper portion was a modern restoration; a more elaborate silver cup, given by Charles II.; a tankard, the gift of Queen Anne; silver coronets to velvet caps of Master and wardens (the former of whom retains the privilege in the presence of the sovereign). Master's gavel and badge, rose-water dishes, mulls, and a tea-urn of last century, which had been reproduced in facsimile at South Kensington Museum. He also showed an embroidered cloth worked with the company's arms, of about George II.'s reign, and some old china.

At *St. Giles's Church, Cripplegate*, Mr. Loftus Brock gave an address, in which he pointed out that this church was rebuilt in the middle of the 16th century, and escaped the Great Fire; with its continuous wide nave and chancel, divided from spacious aisles by lofty arcades, it was a good example of a City church of that period. On the south side, opposite the second pier from the east, was the blocked-up doorway into rood-loft. The church was rich in good specimens of monuments from Elizabeth's to Charles the Second's reign, and possessed plain ones to John Speede, John Foxe, and John Milton; it possessed a carved pulpit of the Grinling Gibbons school, and a reredos of a somewhat later date. It had recently been fully restored by Mr. Edmund Woodthorpe, to whom the excellent roof and some other features were due. In the vestry the entries of the burials of Sir Martin "Furbisher," Milton, and Defoe, and the marriage of "Oliver Cromwell & Elizabeth Bourchier" were inspected, but it was urged that the books containing these entries had been rewritten at a later date. Mr. Lambert remarked that in many German walled towns, including Nuremberg and Ratisbon, there was, as in London, a gate of cripples, and close by it a church dedicated to their patron, Saint Giles. Outside the church, the well-known bastion provoked some controversy, some maintaining it to be Roman, while Mr. Brock said, although a few Roman tiles were re-used in it, the lower part of the masonry was of the 13th century, and the upper stage as late as the 15th century, with patchings of all periods to the present. It marked the N.E. angle of the early city (of Cripple-gate there were Saxon records), and to the south two other bastions yet existed, one by Barber Surgeons' hall, and another behind some house in Castle-street, Falcon-square; the latter, by far the largest and finest fragment, was almost unknown to the general antiquary.

After inspecting the fragments of masonry in *London-wall*, the *Church of St. Mary-le-Bow* was visited. The interior of the church is at present in the hands of the renovator; and most of the visitors, in inspecting it, were more careful to avoid the dust, and the mortar thickly strewn on seats, and the projecting scaffolds and planks, than to observe the fine proportions, the vaulted ceiling, or the monuments to Dr. Newton, Bishop of Bristol, Dame Dyonis Williamson, and others. In the vestry, Wren's model of the church, as he proposed to build it, lacking the elegant spire, and with flanking wings to Cheapside, was seen, and the members descended to the crypt, which, Mr. Brock remarked, was the earliest Norman remains in the City, and still possessed two cushion capitals, some vaulting, and masonry of small stones and wide joints, all characteristic of its period. No record existed of the church in Domesday; but the roof was known to have been burnt in 1090. Sir C. Wren, in his "Parentalia," stated that, in the rebuilding after the fire, became upon the walls and pavement of a temple of Roman workman-hip; but he concurred with the late Mr. Gwilt in thinking that all Wren found was the crypt in which they were then assembled. Mr. Geo. Patrick called attention to the early character of the Norman work, and Mr. John Reynolds compared it with Gundulph's work at Rochester and Malling. *St. Etheldreda's Chapel, Ely-place, Holborn*, was afterwards seen. Father Loebhart acting as *cleverone*, and telling the story of its foundation as an adjunct to the former palace of the Bishop of Ely, the desecration of the crypt as a porter-stores, and the use of the upper chapel by the Wel-h community, its purchase a few years since by the Roman Catholic Fathers of the Order of Charity, and its restoration under Messrs Young and Wheelan. The

west window and the entrance-doorway were illustrated in the *BUILDING NEWS* for June 1, 1877.

The afternoon was well devoted to *Sir John Soane's Museum, Lincoln's Inn Fields*. The party was too numerous to allow of comfortable examination of its treasures, or even of easy perambulation; but Mr. James Wild, the curator, and a staff of assistants, showed sections of the members over the building, pointing out the more interesting exhibits. The rooms are in a pseudo-Pompeian style, and silvered plate-glass is fixed in semi-lunar recesses beneath the cornices, in pilasters, and in angles, so as to increase the apparent size of the building; all the wall-surfaces, and every nook, cranny, and corner are occupied by casts, coins, busts, china, pictures, and other works of art, collected by Soane during a long lifetime. In the library and dining-room Mr. Wild showed some of the best books, including a copy of Pennant's "London," in 6 folio volumes, illustrated by collected plates, pencil and water-colour sketches; it was formerly in the possession of the banker, Fauntleroy, and was purchased by Soane, in 1823, for 650 guineas. Of yet greater interest was the book containing original drawings by John Thorpe, the architect of Elizabeth's time, a volume of 280 pages of folio size, filled with autograph plans and elevations, both drawn oddly enough in perspective and executed in brown ink. (In Vol. XXXIV. of this journal Mr. Maurice B. Adams described Thorpe's book in detail, and gave a series of fac-simile reproductions; these will be found in the issues for Jan. 25, Feb. 8 and 22, 1878.) In an adjoining room were seen a number of paintings by Hogarth and Caldecott, and Sir John Soane's remarkably heavy design for new Houses of Parliament. In the basement the principal attractions were the royal sarcophagus, covered within and without with painted hieroglyphics; it was discovered near Thebes, in 1817, by Belzoni; some painted Dutch glass in the windows, and casts of Greek and Gothic details. On the upper floor Hogarth's "Rake's Progress" series, the china, and some terracotta Caryatides attracted most notice.

MONDAY.

The members reassembled in augmented numbers, opposite *Cleopatra's Needle*, Victoria Embankment, which was described by Mr. G. Lambert, reference being also made to the mode in which it was brought over and re-erected. The *Water Gate, York Stairs*,* was next seen, its present neglected and, indeed, threateningly dilapidated condition awakening considerable comment. It not only remains sunk several feet below the surface of the gardens and Buckingham-street, but the base and lower fourth are buried in earth, and the inclosure is littered with dead leaves and dirty paper. The flags are broken and upheaved, and there is evidently a settlement towards the east; the key-stone of the arch has dropped several inches, and a crack through the masonry above appears to be widening, while the lions on either side have been almost defaced by the weather. Mr. G. R. Wright said, that association could not be blamed for the condition of this beautiful work by Inigo Jones, for as far back as 1873 he prepared a memorial to the Metropolitan Board of Works, which was presented by the late Mr. J. R. Planché, in which they were asked to raise and underpin it, and throw it open as a thoroughfare from the street to the gardens. The Board considered the matter, but were unable to take any action, as the gate was claimed as private property by an individual who objected to restoration. The subject was revived three or four years since and again during the past few weeks, but without result. Mr. Wright then described old York House, which formerly faced the river at this point, and to which, early in the 17th century, this gate was added as a water entrance, from Inigo Jones's designs, for George Villiers, the extravagant and dissolute Duke of Buckingham, who soon after had to part with the estate. The gate had been said, in Gwilt's *Encyclopædia* and elsewhere, to be the work of Nicholas Stone, assistant to Sir Christopher Wren, but his investigations did not tend to confirm this theory.

Chelsea Hospital was afterwards visited, the members assembling in the great quadrangle. This is surrounded on three sides by buildings

of stock brick with red brick reveals to windows; the centre, the oldest part, has a projecting centre of Portland stone, the upper floor carried on four Doric columns, and behind the pediment is the well-known cupola. A distylar colonnade, with covered piazza, runs along this front, and upon the entablature is a long Latin inscription giving the leading dates. The wings are somewhat later in character, but range with chief elevation, except that the central portions, of Portland, have pilasters in place of columns, and are not brought out, while the roofs are broken by dormer lights. In the centre of the quad is a bronzed statue of Charles II. disguised as a Roman warrior, by Grinling Gibbons. Mr. Lambert mentioned that the hospital occupied the site of a college for polemical divinity, established by James I.; but which, within half a century, was rebuilt as a military asylum and hospital by Charles II., the real originator being Sir Stephen Fox, paymaster-general of the forces and ancestor of the Holland family. Sir Christopher Wren, then in the height of his powers and fame, was the architect and one of the commissioners; the foundations were laid exactly two centuries since, and the building was opened in 1692 with some enlargements of the original designs. The present accommodation was for 535 persons. The members then proceeded over the buildings under the guidance of the chaplain, the Rev. Sydney Clark. The main building has a central entrance hall, with chapel to east and hall to west. The former is a large parallelogram with apsidal east end. A high dado of wainscot surrounds the walls; the surface above, as well as the coffered ceiling, being distempered with Roman plaster-ornaments picked out in white; the seating is by modern open benches. At the east end is an architectural composition of a lofty pediment supported by four Composite columns; this and inclined wings are executed in wainscot oak, and inclose a panel of stained-wood marqueterie, containing the sacred monogram; above the altar, in the domical vault, is a fresco of the Resurrection by Sebastian Ricci. At the west end is a shallow gallery, and beneath it, on either side of entrance, the governor's and lieutenant governor's pews. The side walls are hung with over half a hundred flags captured in battles in the Peninsula and the Netherlands, East and West India, China, and Canada, all tattered, torn, and moth-eaten, many merely a few rags hanging at intervals of network. In the vestry was seen a valuable service of silver-gilt plate of James II.'s time, and possessing the elaboration and occasional debased features of that period; it includes massive candelabra for super-altar, as well as the usual chalices, flagons, and patens. The hall, now used as a general day and reading-room, on the opposite side of main entrance, corresponds in size except that the further end from door is square instead of apsidal, and is hung with a large painting, by Verrio, representing Charles II. on horseback, with the hospital in background. The walls are hung with a collection of decaying standards like those in the chapel, and beneath these is a collection of engravings of distinguished generals. A case of unclaimed medals contains some examples, otherwise very rare. One of the ranges of berths was taken as a sample of the whole, which accommodate some 510 men. Facing a range of windows is a series of continuous wainscotted cubicles, each containing a bed, table, and stool, with shelf above; attempts at decoration had been made, in most cases, with prints and photographs; but the ventilation of the ward appeared far from perfect. The chaplain's private apartments, with beneath them the quadripartite plastered vaults, the sole remains of the former theological college, and the infirmary were next seen. The visit closed with an inspection of the great drawing-room of the governor-general, where Sir Patrick and Lady Grant, the present occupants, described the valuable paintings on the wall, including Van Eyck's portrait of Charles II., with his Queen, Henrietta, and their children, Charles and Elizabeth: the first three Georges and their Consorts, and her present Majesty. A sculptured head of Buddha, found on the site of a former monastery at Takht-i-Bahn, Afghanistan, was stated to be the highest type of Asiatic art. It is supposed to have been buried in the fifth century A.D., at the time of the Mahomedan invasion; the features are regular, almost feminine, and finely chiselled.

* A perspective drawing which gained the Royal Academy silver medal, by Mr. R. Gibson, appeared in the *BUILDING NEWS* for Nov. 14, 1879.

The *Old Parish-church, Chelsea*, was next seen, under the guidance of Mr. Brock, who claimed for the well-known red-brick tower considerable merit, although it had been greatly injured by the loss of its cupola. It had, he said, the boldness, simplicity, and dignity of a Norman building. Inside, the building is of very unusual proportions, comprising a nave wider than it is long, a short chancel, with north and south chapels, the latter of transeptal form. The oldest portion is the north, or Lowndes chapel, where the windows are of the middle of fourteenth century; the south chapel was built by Sir Thomas More when Lord Chancellor, but the majority of the churchwork dates from the rebuilding in 1667-9, when the nave was lengthened. The capitals of arch opening into the More chapel bear the Chancellor's arms, and are dated 1558, but are, Mr. Brock remarked, quite French Renaissance in feeling, and are artistically carved. The monuments, very elaborate and numerous, include a large altar-tomb, of Late Renaissance character, to Reginald Bray, 1563, the architect to Henry VII., for his chapel at Westminster and Windsor Castle; a monument to Lord and Lady Daeres, 1595, Jacobean in style, and of variegated and costly marbles; another, of heavy Ionic character, by Bernini, to Charles Cheyné, Viscount Newhaven, who died 1698.

Holland House, Kensington, was seen in the afternoon. Driving up the great avenue, now littered with fine elms uprooted or snapped through the trunk or branches by Friday's gale, the house was seen standing to the left; it is built of brick, with carvings and festoons of free-stone and Portland stone. The mass on plan is broken up by two angle-towers with steep-pitched slated roofs and a cupola, by crow-stepped and multicurved gables, and by oriel and balconies on the chief front. The entrance is on the east side, which is a blank wall, having pilasters of carved stone, the three orders being used in succession at the intersection of strings. In the great hall the visitors were received by Mr. Lane, house-steward to Lady Holland, who conducted them through the principal apartments. The house contains 87 rooms, and is a very storehouse of art treasures collected by the occupiers during several generations. Portraits, rare volumes (the library numbers 27,000 volumes), tapestries, antique furniture, rich decorations, and relics of eminent personages combine to make up an artistic whole that it was impossible to do justice to in an afternoon. Not only so, but the historic associations of a house that had for nearly three centuries been "the favourite resort of wits and beauties, of painters and poets, of scholars, philosophers, and statesmen," could not fail to be deeply interesting, apart from the material attractions with which in these columns we have chiefly to concern ourselves. Noting a sedan chair in the hall, and late tapestries in one or two intervening rooms, the Journal room was seen—a long apartment, well furnished, and hung with many portraits, of which the most noteworthy were those of Prince Talleyrand, Sir James Mackintosh, and the late Princess Liechtenstein—the last by Mr. G. F. Watts, 1857. In the next, the China-room, was a great deal of Dresden and Sevres ware, and some Chelsea china given to Dr. Samuel Johnson: from the centre of the moulded and gilded ceiling hung a large chandelier of Venetian glass. In the West room are two Hogarths, the "Play of the Conquest of Mexico" and "Ranelagh Gardens," together with a framed receipt from the artist to the Hon. Henry Fox for two guineas, for these and several other paintings, in which the "March to Finchley" heads the list, being priced at 10s. 6d. In the next, the music-room, were portraits of M. Guizot, Thiers, and other French statesmen. The ceilings in most of the rooms in this suite are very simply treated, having a white ground with a small portion raised, and picked out by gilding; and passing up a narrow side staircase the visitors came to the library, a long narrow apartment, extending the whole breadth of the house, and, until modern times, only lighted by end windows, the remaining space being given up to book-shelves. The ceiling was, however, formed into a series of vaults for the late Lord Holland, and these have each a single sheet of obscured glass, the concave surfaces beneath being coloured blue, and powdered with stars. In the north-west corner is Addison's writing-desk, and in the chamber to the east, now the family dining-

room, the gifted essayist died. This room is hung with portraits of Lord John Russell, in youth, by Hayter, several Ladies Holland, including the mother of Charles James Fox, painted by Sir Joshua Reynolds, and the present holder of the title, by Mr. Watts. In the common drawing-room were seen a St. Francis, by Murillo, two of Teniers' genre subjects, and a portrait of C. J. Fox, with a receipt by Reynolds for 100 guineas for the painting. Several relics of the First Napoleon having been inspected, the members came into the gilt drawing-room, in which the decorations on walls and ceiling are in a brilliant and almost garish key, although it was stated they had not been repainted for two centuries (*sic*). Here, Mr. G. R. Wright read an historical account of Holland House, which he showed occupied the site of the old manor-house of Abbots Kensington, the residence of the De Veres. The older position of the existing residence was built in 1606 by Sir Walter Cope, groom of the bed-chamber to James I., and by him left to his son-in-law, Henry Rich, afterwards created Baron Kensington and Lord Holland, who employed Inigo Jones, then rising into notice, to add wings and arcades, and changed the name from Cope Castle to Holland House. In a lucid manner Mr. Wright followed the fortunes of the house, and the families who have possessed and inhabited it from that time to the present day, showing how General Fairfax, William Penn, Joseph Addison, and his wife the Dowager Countess of Warwick and Holland, Henry Fox, the Whig statesman, first Lord Holland of the new creation, and his more talented second son, Charles James Fox, had in turn lived within it. Mr. G. Lambert followed with a paper upon Inigo Jones, in which he traced the career of James Evans, the son of a Cheapside mercer, from his early struggles to his appointment as surveyor-general, and referred to his works in this house, at Whitehall, the portico of Old St. Paul's, York-stairs Gate, and St. Paul's Church, Covent-garden. Mr. Loftus Brock mentioned that at the Soane Museum on the previous day, while turning over the pages of John Thorpe's book, he found a plan entitled "Plan of a house at Kensington for Sir Walter Cope by me, J. T." This agreed so nearly with the arrangement of Holland House that he was convinced Thorpe was its architect, and the treatment corresponded with that in his book and in other works assigned to Thorpe. The later work by Jones could easily be distinguished by the introduction of Portland stone. After the visit the members accepted the invitation of Mr. and Mrs. Brock to tea at their home in Colville-square.

TUESDAY.

On this, the closing day, two palaces, those at Fulham and Hampton Court, were visited; but the greater part of the day was lost in loitering, owing to an unfortunate mistake in the carriage arrangements. At *Fulham Palace*, which is still surrounded by its moat, the members were welcomed in the hall by the Bishop (Dr. Jackson), who said although the site had been that of the residence of the Bishops of London for eight centuries, he had unfortunately nothing to show the members earlier than the time of Henry VII., when the quadrangle through which they had just entered, now used as domestic offices, was built by Bishop Fitz-James. The hall in which they were met was of that period, and formerly possessed an open roof in place of the present plaster ceiling, but was altered and rearranged to serve as a chapel by Bishop Sherlock in the time of George II., and was again changed and refitted as a library by Dr. Howley, half a century since. When a new and more commodious chapel was built by Dr. Tait, fourteen years ago, the apartment was again used as a place of assembly and reception. The oak (Jacobean) screen at the lower end was brought in recent times from Doctors' Commons. The bishop then conducted the party over the house and grounds. Returning to the quadrangle, it was seen to be on all four sides of two-storied continuous buildings of red brick, diapered with diamond patterns of black bricks, and having tiled roofs. The south side of quadrangle was refaced by the late Bishop Blomfield in the old style, except that buttresses were added, but the Tudor brickwork, visible elsewhere, is of excellent quality. A low carriage entrance is pierced through the west-side, and faces a squat clock-tower, also of red brick; in the centre is the carved

stone base of a fountain now filled with flowers. Some of the rooms on upper floor of the south-side, now used as a laundry and bedrooms, were visited, but contained no traces of Bishop Fitz-James's work except the linen pattern panelling remaining here and there. The outer front of this side, facing the river, retains its original carved barge-boards to the three gables, and although very plain, is not without picturesqueness. To the east, and beyond the quad, is the new private chapel, erected from the designs of Mr. W. Butterfield in 1866. It is Early English in style, seated stallwise, and appeared somewhat inadequately lighted; all the windows, which are in the west front and the east end, being filled with stained glass. The internal walls, above dado level, as at Keble College, display the use of coloured brickwork with which the architect's name is associated, and over the altar is a mosaic of the Adoration. Between the lawn and kitchen-garden is a gateway of moulded brickwork, of Bishop Fitz-James's time, and the desolating work of the recent storm on the old trees was visible; thirty-seven have been blown down or broken off, including a locust-tree planted in 1682. The east, or chief front of the palace, that to the lawn, shows a plain building of two stories with a parapet concealing roof, and eight uniform square windows on each floor, the lower ones carried down to garden level; these rooms, the library and dining-room, contain portraits of all the bishops since the Reformation, the most interesting being those of Bishops Ridley, Bonner, and Laud, Juxon (by Van Eyck, the most valuable picture in the collection), Tait (a full-length subscription portrait, by Sydney Hodges), and the present bishop (by Richmond). All the earlier ones to Bishop Compton, 1675, wear black caps, while Bishop Gibson, 1723, appears in a full-bottomed wig, a headress retained till Bishop Blomfield.

On leaving the palace, the members should have proceeded by road to Kingston; but the carriages had been sent, it was found after much delay, to Lambeth instead of Fulham palace, and the breaking of a trace on Putney-hill further detained the party. These accidents necessitated the cutting out of Wimbledon camp from the programme, and even then, after a hurried luncheon at Kingston, *Hampton Court Palace* was not reached by the first section of the party till 4.30. Mr. Graham, the superintendent, and Mr. Chart, the clerk of works, had been awaiting the members for two hours, the latter provided with plans and particulars, but although the official hours of closing were past, they escorted the members over such parts of the buildings as could be seen by the failing light, Mr. Chart showing where the work of Sir Christopher Wren and Inigo Jones was built into that of the palace erected for Wolsey, both in the courts and in the chapel, where, although the general proportions, richly gilded pendentive wooden roof and gallery of Henry VIII.'s time remain, the wall surfaces, altar, and fittings are by Wren. In this chapel a large picture of the Adoration, by an Italian artist, is at the present time placed in front of the altar, by Mr. Robinson, for the inspection of the high chamberlain, as it is proposed to re-fill the altar-piece, now occupied by mere parquetry, with some work of art from the national collection. In the great hall, Mr. Reynolds said that we had here one of the latest examples of a Medieval hall, still perfect, although the dais had been removed and the old communication with the buttery in the north wall closed, and a modern door cut in the centre of east wall into the withdrawing room—the "common room" of Oxford, and "combination room" of Cambridge Colleges, where the same arrangement might still be seen. The rich oriel on the south side near the east end was simply the recess for the sideboard. After some further remarks by Messrs. Chart, Reynolds, Wright, Lambert, and Patrick, the members proceeded by train to Streatham-hill, concluding the London meeting by a visit to the residence of Mr. Morgan, F.S.A., the hon. treasurer.

ARCHITECTURE AT UNIVERSITY COLLEGE.

(Continued from p. 488.)

YOU shall now hear exactly what is done and is to be done in the classes. They include three courses, denoted A, B, and C, and treating

respectively of art, science, and professional work.

The art-class—Class A—approaches architecture as a fine art from the side of history, and necessarily so. You can hardly in any other way understand the subject. The design of every great group of buildings—nay, to a greater or less extent, of every single building of importance—was largely influenced by the design of buildings previously existing, and, in its turn, exercised an influence on what was built afterwards. An English church, for example, is planned in the manner familiar to you all, with a nave and aisles, mainly in consequence of that arrangement having been in use near the Christian era in Rome for courts of justice. In short, there is little about a building that cannot be better understood by knowing its history than in any other way, and there is much which is quite unintelligible without such knowledge.

Course A, as given by my learned predecessors, has embraced that series of architectural styles which stand in some sort of relationship to the architecture of modern Europe. That is to say, the ancient architecture of Egypt, Assyria, Persia, Greece, Etruria, and Rome, and architecture since the Christian era,—of the styles known as Basilican, Byzantine, Romanesque, Saracenic, Gothic, and Renaissance. This is an immense field. It certainly shuts out the vast and extremely interesting architecture of India and Japan, but with this exception it leaves very little of interest unnoticed. Professor Donaldson used, I think, to bestow most of his attention on the Classic styles of the ancient world—the field where his laurels as an investigator and a discoverer were won. Professor Hayter Lewis, if I mistake not, lent more in the direction of Early Christian and Saracenic art—subjects to the study of which he has devoted much time abroad as well as at home. Possibly my own inclinations, and my studies on the Continent, may induce me to devote a rather larger proportion of attention to Renaissance work; but I shall endeavour to follow my predecessors in giving fair and honest attention, so far as time will permit, to each part of the field in turn.

It is, of course, not possible, in dealing with so large a subject, to treat much of it in great detail; but though a comprehensive view is sufficient for the ordinary purposes of the student, I am convinced that he ought to be taught some one style more thoroughly, partly with a view of putting him in the way of studying other styles for himself with equal thoroughness, and partly also in order to prepare such students as intend to offer themselves for examination at the Institute. I propose, accordingly, as an experiment, to expand one portion of the course, and treat one subject at greater length, or at least in more minute detail, than the rest, endeavouring to pursue it far enough to make the class somewhat familiar with the mouldings, ornaments, and more minute details of the style, as well as with the general architectural forms and the leading features of the buildings.

I propose for the present session to select the subject of Greek architecture for this treatment. Greek is the architectural style which, within certain narrow limits, approaches nearer to absolute perfection than any other, and it may, with perfect truth, be called the fountain-head alike of modern and of all Classic architecture. Should the result of this attempt seem to warrant it, I shall propose, in another session, to expand, in the same manner, the treatment of some other part of the course.

The course B deals with the science of architecture, that is to say, with materials, and with construction (as the art of putting materials together in a building is called). We shall take the principal natural building materials, such as timber, stone, and marble, and the principal manufactured ones, such as bricks, cements, and iron, and try to become familiar with their appearance, their properties, their strength, their fitness for use in a building, and the indications of their being of good or bad quality; and when we know something about each material we shall try to follow it out in the building, and consider the parts of a structure in which it may be best employed. Thus, after timber will come floors, roofs, and various framings. After bricks and cements, we shall consider brickwork and such subjects as the bond of bricks and foundations. The building-stones lead us to walling, masonry, arches, vaults, and the most difficult constructions that the builder has attempted;

while, after considering iron, we shall learn something about fireproof floors, iron roofs, and other applications of iron to building.

These lectures on materials and construction are included in the course of study recommended to civil engineers. The materials and methods employed by the builder and the architect are, to a large extent, the same as those with which the engineer has to deal, though they are usually employed in larger masses in his structures than in ours, and under different conditions, requiring, more often, very close calculation of the stresses they have to resist. I trust that the engineering students who may attend the course will give the work of this class a due share of attention. Some of them have carried off the highest prize which it has to offer. Others have failed to obtain a certificate, and have been chagrined at their failure. Yet the lecturer, the professor, the examination papers, and the system of making answers, are the same for all. Success depends solely upon the pupil. It may be impossible for him to be the first in any given year; but, with ordinary abilities, nothing but application is required to secure a certificate of having passed the examination with credit.

Want of time has prevented hitherto, and no doubt will still prevent, much attention being given by this class to joinery, plasterers' work, and the other finishings of a building; but some care will be bestowed upon the construction of drains and the sanitary fittings connected therewith, though for the full study of sanitation I must refer you to the lectures of my accomplished colleague, Professor Corfield.

I shall throughout direct attention, also, not only to the properties and use of these materials, but to their defects and failure. It cannot be too strongly impressed upon the mind that from the day the workman leaves a building the tooth of Time begins to attack it. Forces of all kinds tending to produce decay and ultimate destruction are at work, and while structures of colossal strength, like the pyramids of Egypt, may keep them at bay for thousands of years, ordinary buildings are not long before they begin to suffer. The failure of buildings, and the precautions to be taken to avert it and to remedy it when it has become serious, will therefore form one of the subjects of this course.

The collection of diagrams illustrating courses A and B, prepared through many years, as I have already stated, by Professor Donaldson and Professor Hayter Lewis, now reaches to many hundreds of examples, chosen with special reference to the purposes of these classes, and represented in drawings of great excellence. These are, by the kindness of the two past professors, still available for the purposes of the class. The larger portion of them relate to the art course, but there are a considerable number bearing upon construction.

Some useful specimens of building materials of various sorts are available for illustration of the lectures on construction. The series of specimens is, however, not extensive, and I am taking steps to increase it, so as in a short time to make it very serviceable as an aid to instruction.

The collection of illustrations is also constantly increasing. I have added, and shall add, diagrams, prints, and photographs, and I hope occasionally to make use of photography in another way; that is to say, to exhibit once, if not oftener, some illuminated photographs, by way of giving a more vivid representation of ancient buildings than is possible by the aid of drawings or photographs seen in the usual manner.

Course C.—The course of lectures on practice is not so long a course as either of the others, and is intended chiefly for giving men who have become to some extent familiar with the routine of professional work, and especially for those who are about to start in practice, or have recently begun practice on their own account. It is my desire in this course to put the student in possession to a certain extent of the results of experience, so that he may know what he is likely to have to do or encounter when acting as an architect on his own account. I need hardly point out that a pupil or assistant, especially in a large office, while probably enjoying ample opportunities of working on plans and specifications, is not always—in fact, not often—brought into contact with the negotiations that the architect with whom he is has to carry on, may not see much of the supervision of works; and in short, looks at the transactions relating to a

building from the point of view of an irresponsible employé, and not that of a responsible professional man. The aim of these lectures is to teach students some of the things which they would otherwise have to find out for themselves when entering practice, and which they had far better know beforehand.

The course travels over the following subjects, beginning with what is most likely to be familiar, at least in part, and proceeding to questions that are more and more special:—the preparation of plans and specifications and the ordinary routine of building operations, including planning for special purposes and requirements; the preparation of all the required documents, conditions of contract; the principles on which estimates are prepared, the supervision of buildings, the usual mode of stating building accounts, and the professional charges which the architect is entitled to make. The next series of subjects in this course deals with those aspects of architectural practice which relate to law. First, and of great importance, the London Building Act, and other Acts regulating buildings which have been founded upon it. Then the law of light and air, of contract, of the tenure of land and houses, and some account of arbitrations and of such questions as are most commonly litigated in connection with building operations.

Lastly, I shall endeavour to give you a brief account of that class of professional work which all architects are liable to be called upon to perform in connection with existing buildings, such as surveys for dilapidations and various purposes, valuations, and the like.

I am sure that it will be of service to many a young architect to be warned and instructed beforehand about his routine, his charges, his Building Act difficulties, the restrictions he has to cope with when building on leasehold land, or the risk he runs where ancient lights are interfered with: rather than to have to buy his experience in these and similar matters at an expense of money to his client and of vexation to himself.

To this outline of the courses of lectures I propose to add some account of the method pursued.

The objects to be kept in view are twofold: first, to convey information; secondly, to make the students think for themselves.

A large portion of the lectures is unavoidably devoted to giving information. It is of great importance to fix in the minds of the students those facts relative to their future profession which are most useful for them to know; so, of necessity, much of the time which the professor and his classes spend together is devoted to telling, or illustrating, or recalling the most important of those facts.
